The great Hall collection of fossils purchased from Prof. James Hall at a cost of ($65,000) sixty-five thousand dollars, is now safe in the lower hall of the new building, and some idea can be gained of its size by the fact that it is contained in over five hundred large sized boxes and weighs in all over fifteen tons. It contains specimens that can be counted by the million, and ranging from the delicate Phizopod to the curious Oreodon and massive Ichthyosaurus. The collection is the work of a life time, representing over fifty years of hard research and study, and the fact that it contains four or five thousand types and illustrated specimens, will give an idea of its value. Although essentially a Palæozoic collection, it is perfect in most of the latter eras, and especially the Tertiary. One great beauty of the collection is the large size of the specimens, and in many cases the slab contains hundreds of different species of crinoids, shells, corals, etc., showing them as they were deposited upon the old shore, and showing at a glance what species were contemporaneous. Not only is there a distinct duplicate collection that vies with the original in value, but every species is duplicated over and over so that there is in reality stock enough for four or five complete collections that will be worth their weight in gold for foreign exchauges. Many of the shells can be counted by the thousand, and of one species there are forty thousand. Although the collection is very complete, it will be kept up by continual additions and in proportion to the discoveries that are almost daily made. Prof. Hall now possesses a geological library that will ultimately follow the collection, as of course they belong together—the one referring to the other. So great are the additions that have been made to the Museum during the last year that it will be necessary to retain the old Arsenal for want of room, and even if a new wing were ready all three could be used with ease, owing to the now cramped state of the collection. The Arsenal, however, will be used for the duplicates, of which there are a complete set in all the departments. Probably two years more will see a new wing completed, and a movement is on foot among the members to connect with the new building an aquarium, a desideratum that New York has long needed. In this respect we are far behind, and the cities of the old world, most of which, if they have not a large one, have at least an apology. The distance from the sea is no longer an objection, owing to a new plan of infiltration that enables one to use the same water time and time again, so the water could be brought from Sandy Hook once in two weeks at slight expense. So we have in the future one of the greatest Museums in the world, and if improvement and additions continue in the same ratio for the next few years, we may well with pride point to an institution that at once appeals to the people and belong to them, and is a good exponent of our advancement hand and hand with science during the last one hundred years.

NEW YORK STATE SPORTSMAN'S ASSOCIATION. — The eighteenth annual Convention of the New York State Association for the Protection of Fish and Game will be held at Genesco, commencing on the 22d inst., and continuing until the 27th. The programme is as follows:—

The Convention will meet at the Court House at Genesco, on the evening of Monday 22d. On Tuesday, at 8:30 A. M., the proceedings will begin with: 1. The State trap shoot, 10 single birds each. No. 2. Pistol shooting, off-hand. No. 3. Rifle shooting, short distance. No. 4. Single trap shoot, for amateurs, 10 birds each; four prizes. No. 5. Rifle shooting, long distance; three prizes.

Third Day, Tuesday, 8½ o'clock.—No. 1. Pistol shooting; two prizes. No. 2. Fly casting; three prizes. No. 3. Single trap shoot, 10 birds each; four prizes. No. 4. Rifle shooting, 220 yards; three prizes. No. 5. Double bird shoot, 10 double rises each; four prizes.

Fourth Day, Thursday.—No. 1. Press shoot, five single birds each; two prizes. No. 2. Single trap shoot, fifteen single birds each; four prizes.

Fifth Day, Friday, 9 o'clock A. M.—Livingston Association Cup, donated by James W. Wadsworth, Esq., Geneseo; open to all organized clubs of the State of New York, each club to be represented by two of its members resident in the county in which the club is located. No. 2. Grand State prize, the Dean Richmond Cup, to be shot for by three members from each club.

Sixth Day, Saturday, 9 o'clock A. M.—Grand sweepstakes match; three prizes; twenty-five single birds each.

Valuable prizes are given for all the contests. The programme of the bench show of dogs, to be held at the same time, was published in our last issue.

WORK FOR SPORTSMEN'S CLUBS.—The Syracuse *Journal* says:—

"There are more trap nets in Oneida Lake at the present time than ever before. In one bay—and that a small one—there are seven. A correspondent of the *Journal* foreshadows the consequences: 'We will suppose that from one net there is taken each day 350 fish, and these fish will average two pounds apiece. This makes a total of 700 pounds, sold for seven cents a pound, amounting to $49. I do not think the above a large average, for I have heard of 1,000 bullheads being taken out of this same bay. Now, is this wholesale slaughter of the finny tribe to be allowed, or stopped? I will leave the question with the people, or rather with the law.'"

If the above is a correct statement, and if it is true that trout spearing in the fall is a common occurrence in the same vicinity, we should think that with all the sportsmen's clubs in Central New York, these illegal practices might be broken up.

—A Cumberland Baronet (England) having a superfluity of Canadian geese, (*Anser canadensis*), which were becoming pugnacious, wrote to our correspondent Mr. Jackson Gillbanks to ask if he could do with a couple, and demanding an immediate reply. Next day he had by half-penny post card the following:—

I send this notice, worthy friend,
As quickly as I can, sir,
On Saturday, if weather mend,
I hope to have your "anser."

—The St Augustine (Fla.) *Press* of May 6th contains these items.—

Green turtles in vast numbers abound in the harbor at present. Boys congregate at the head of the wharf and stone them as they appear on the water's surface.

A flock of pink curlews has been seen in this neighborhood lately. They are worth $3 each, for their feathers.

Rattlesnakes are almost daily seen in the vicinity of the city.

Winter visitors miss all this.

—A correspondent makes a suggestion which is worthy of the attention of advertisers—that is, that they should more frequently give the prices of their goods in their advertisements. In the present instance our correspondent refers to powder manufacturers, and says: "How easy it would be for them to give the prices of each package named. Many persons could order off-hand from out of the way places, if they but knew the prices, to avoid an inferior article, for bad shot and poor powder are plenty, even in first class country stores; nor are the coarser powders usually kept."

—American silver is again spoken of in Canada as a "nuisance," and is taken only at a large discount.

"EL BRONCHO."

AN AFTERNOON'S LOUNGE IN A JERSEY STOCK-YARD—THE RACE AGAINST TIME.

Years ago, when the secrets of the earth, which has raised an empire out of the wilds of the Pacific Slope, were the sole property of a few wandering savages, and the nerveless hand of the Spanish rulers still retained some lax hold on the province of California, the fond lover of Los Angeles who desired to consummate his happiness was compelled to journey to Santa Barbara to obtain judicial permission to do so. It was unwritten law in the etiquette of the Señoran swain to perform this momentous voyage in the twenty-four hours preceding the ceremony; so after dinner on the day before that of the wedding he was up and away, over mountain trail, and along sandy seashore, with the night wind, the forest voices, the moaning sea, and his own pleasant thoughts for company. A reckless ride of seven hours would find him at his journey's end, with all he loved sixty-five miles behind him. With morning came the buying of the license, and the return, and high noon found him nearing home again, where, before nightfall, he would have to look back over the experience of a ride of one hundred and thirty miles and a wedding, all compassed within the space of twenty-four hours.

Long afterwards, when the province had been lost to its senile owners forever, and the Saxon delved for gold by every mountain stream, another class of horsemen rode a longer journey. Beneath the hurrying feet of the Pony Express the great plains slipped away like running water, and wondering people on the Atlantic Slope listened to tales of riders as furious as that of "Lenore," and of endurance without peer. The bleaching bones of many a foundered animal and the skeleton of many a fallen rider exist to-day as monuments to the men and beasts who outrode time, and fought the swift air of the prairie for the palm of speed. But the race has not died out; the men of steel have not passed away from the slopes of the Sierras, and the mustang ranges the prairie as of yore. Little by little their sphere of usefulness was trenched on, first by the stage coach, then by the railroad train, that now thunders through the cañons, whose echoes once caught up the thud of flying hoofs alone. The mail riders of '49 are degenerated into the ranchmen and *vaqueros* of to-day, but with the same skill, the same blood and bone, the same indomitable energy, and above all, the same stock for their saddles as of old.

What stuff this stock is made of, and what the men who ride it are like, might have been ascertained by a visit to the stock-yard outside of Jersey City, where the mustangs to be ridden in the coming race against time here were confined. A five-mile ride across the flats brings one to the place, where, in the enclosure in the rear of a decayed country tavern, thirty-six unkempt, vicious devils of equinity held possession of a corral by virtue of pure cussedness and powerful heels.

The prevailing colors of this singular stud are sorrel and roan, and to the devotee of fancy stock it is a collection of animals as unpromising and ugly as could well be found. But a closer inspection of them will be likely to induce a change in that opinion, and the last atom of dislike yields before the picture of one with all its picturesque trapping and mounted by its lithe and fearless rider.

In appearance the horses are small, with fine heads, and limbs clean cut and beautiful as those of an antelope, ending in hoofs strangers to a shoe, and small and dainty as a princess' hand. Great nostrils that constantly quiver; great eyes that peer out from the shaggy forelocks full of blood and fire; ears fine as those of a terrier, always pointed while in rest. The only ugly features about them are the manes and tails, which during the long journey on short fare, were eaten ragged. One in the stud, however, a cantankerous sorrel known as El Indio, has managed, by dint of very viciousness, to preserve his hirsute beauties in their entirety, and roams the corral with flowing mane and a tail that sweeps the thickly hay-strewn ground.

The notable exceptions to the ruling colors are four—a buckskin filly, quite unbroken, whose capture cost the *vaqueros* a ride of twenty-five miles; a white horse, the one used among others in running down the very stud of which he is now a member; an iron-gray, known as "Old Blue," and the best broken of the drove, and as ugly a black as the sun ever shone on, with hanging lip, coat that has never known the comb, tail eaten to a stump, and mane as short as a mule's. This beast lopes in his especial corner, with one eye on the fodder, and the other in a condition of lively expectancy anent the possibilities of getting in a a kick at somebody or something, a chance he never allows to pass. Yet this *bete noir* is, next to a certain sorrel, the fastest one of the drove. He has as yet been ridden only a few times.

About the stall doors that open from the shed, which closes one side of the corral, lie great California saddles, gaudy horse cloths, and trappings queer in form and weighty with silver, Mexican bits, spurs with rowels like large pen-knife blades, horsehair larriats and lassoes of rawhide. Picturesque men in careless dress and with bronzed, weather-hardened faces lounge in and out among the animals to an accompaniment of jingling spurs, and with a cool disregard for the treacherous heels of their charges that impresses the timid outsider with awe. On the ground is a mustang, which has been lassoed, thrown down and hobbled so closely that it cannot make use of its feet, being shod. The animals came here and are in most cases yet unshod, but the exercise on the hard roads and the neglected track half a mile from the stockyard has affected some of their hoofs so that it is necessary to shoe them. The prostrate animal screams and struggles in futile wrath, and its companions take up and echo the cry in savage chorus, while the shouts of a motley group of hoodlum lookers-on beyond the fence add to the confusion and contribute to make up a scene never to be forgotten.

The operation of shoeing completed, the farrier makes his exit to a safe corner of the inclosure as nimbly as he can, and one of the stockmen, by a dexterous twist at the hoods frees the animal's feet. In a moment he is up, and with an evident purpose of avenging the insult put upon him, since he makes a dead set at the farrier, who on his part looses no time in scaling the fence. The action is not necessary to his safety, however. Before the furious beast has reached the spot where the fugitive was standing a sleuder loop serpentines through the air, falls upon his head, and in a second is jerked tight about his neck, a moment more and he is fastened to the hitching bar in the centre of the yard, squealing, kicking in a circle, and pawing the earth up with his savage, and to him, so strangely cumbered hoofs.

Another is subjected to the same ordeal, and another, and so on until their owner, looking at his watch, suggests that three of the wildest be saddled and given a turn on the track before the carriage returns to town. The three selected are a sorrel, a roan, and the iron grey already described. The two first are perfect maniacs, and the operation of saddling is one of difficulty and danger, but it is completed at last, and the corral gate is opened. With a quick spring the three riders are in the saddles. The roan, ridden by the Mexican Frank Peralto, takes to bucking lucontinently, but a twist of the jaw-grinding bit conquers, and he shoots out of the gate like a rocket, followed closely by the others. Away they go over the hill, followed by the carriage and all the loungers, racing along at the top of their speed.

The track, an abandoned course, is in a terribly stony state, and divided in such a way by an open drain that it is impossible to utilize it for more than half its extent. Over this course the animals plunge. They are ridden at a dead run, the sorrel a length a head. At the ditch they stop short to a touch of the rein. A napkin would almost cover the ground lost in the balk. A moment more and they are coming back, are by, stop at the other extremity of the track, and wheel about as before.

Can these be the same animals that half an hour ago were seen in the stockyard? On their way back as they come down the sand road, through the leafless oaks, at a gallop, the question suggests itself involuntarily. Their heads are up, ears forward, nostrils pulsating, and the great eyes start almost from their sockets. Trappings jingle, leather creaks, and the thud of their rapid hoofs goes before them on the spring wind. The clouds are dividing overhead, the bare branches are bending, bloody spume is flecking the deep chests, and from the quivering nostrils come little runnels of blood. All is life and fire and motion infinite, from horses and riders to the elements, and the afternoon sun behind the cloud of dust the horsemen conjure up turns it to a background of gold, out of which this tempest of action comes. A new picture takes the place of the Jersey marshes, and the windy grove is gone. The air coming up from the sea is for a moment that of the boundless prairie; the life we are looking at is one that poor city folks know only in books and dreams. These are the horses the Sonoran lover and the Pony Expressman rode, and the men upon them to-day can do the same.

Pshaw! It is only a dream after all, or rather like some finely painted figures that one sees occasionally in inappropriate back-ground. However, it has served one purpose. It has given a hint of what the *broncho* can do in our Eastern air, and awakened pleasant anticipations of the coming race. All honor to the little demons. With the ability to do what they have done to-day, they should be privileged to make a target of our species once in a while.

Californian's claim that these animals are, for endurance and speed, the best in the world, and after witnessing the scene so imperfectly described, their assertion can be readily understood. No thorough-bred is born which, undergoing the treatment, carrying the weight, and feeding as coarsely as these, could carry out the conditions of the race, if indeed, it could carry them out even under the most favorable circumstances. The records of Mowery, Powers, and McNabb, are portions of the history of equestrianism. The present feat is, as originally intended, a reproduction of the first one's performance, on August 2d, 1868, at "Bay View Park," near San Francisco. That ride was made over a mile track. The animals, thirty in number, were the common mustangs, and half breeds. The distance, three hundred miles, was ridden in fourteen hours, nine minutes. The first two hundred miles were accomplished in eight hours, two minutes, and forty-eight seconds. The limit of time for the present race was, however, finally decided on for fifteen hours. The other conditions were the same as obtained in the Mowery feat, *i. e.*: The race to be ridden entirely by one man, the number of horses to be employed, thirty, the track, a mile track, the animals, California native stock, ridden in California style. $25,000 was said to be staked directly on the non-success of the performance, against $15,000 and the expenses of the affair, already more than half as much, on the part of the owner.

This match was to to have been decided on Tuesday last, but for some reason was postponed until to-day. The riders are three in number, a Mexican, Frank Peralto, and two Americans, Budd Parker and John Francis.

Our American long races against time, have excited great interest in sporting circles abroad as well as at home, and this introduction of them on the Atlantic Slope will bring a new life to sporting matters here—since even its failure will lead to other and ultimately successful efforts. The record of the California distance riders has never been approached at all abroad, save in one instance, that of Mr. Geo. Oshaldiston, who in 1831 rode two hundred miles on thorough-breds, twenty-eight in number, in eight hours and forty-two minutes, the greatest feat of horsemanship ever performed in England.

Other interesting relay races have occurred across the water though. The first recorded relay ride of special note, in England, was that by which the news of Queen Elizabeth's death was carried to James I; her successor then in Scotland. Sir Robert Cary was the messenger, and he rode four hundred miles in three days, resting the intermediate nights. In 1741 a Mr. Wilde rode ten horses over a distance of one hundred and twenty-seven miles in six hours and twenty-one minutes. Four years later Mr. Thunhill rode two hundred and thirteen miles in eleven hours. In 1761 J. Woodcock rode one hundred miles a day for twenty nine consecutive days. Of later feats, that of Mr. Oshaldiston, and of Mr. Burke, of Hereford, who drove a span of horses over forty-five miles in two hours, fifty-five minutes, are most important. One of the horses driven was American, imported from New York. One lady, at least, claims the honor popularly accorded to all exhibitions of endurance and pluck, Miss Pond, who in 1758 rode one thousand miles in one thousand consecutive hours, on one horse. A worthy rival of her horse, if not of herself, was the little Galloway, which at the end of the last century performed the same feat, at Carlisle. There seems to be a strong family resemblance between the Galloways and our Mustangs, any way. In 1754 another of the former trotted one hundred miles a day, for three consecutive days, over the New Market course, and came out by no means sensibly distressed.

A WORK OF ART.—Dining-room taxidermy is becoming popular as a mode of embellishment or ornamentation, but Mr. Alex. Pope, Jr., of Boston, has gone to a point beyond, and carves from wood fac similes of game birds in a manner which almost rivals nature itself. A number of his carvings have been on exhibition at Schaus' Gallery, where they excited great admiration. This art of carving requires the skill, not only of the carver, but the painter, for after the form of the bird is cut it is necessary to paint it with sufficient fidelity to deceive. Such a specimen of Mr. Pope's skill is now on view at this office, and the most practiced eye is deceived into believing it to be a natural bird.

CENTENNIAL ALLIGATORS.—We infer that the Centennial Exhibition is well supplied with alligators. In one portion of the grounds we know of a large tank which swarms with small ones. Fred Mather, Esq., has charge of the Alligator Department; one of our Texas correspondents offered him a ten-foot reptile some weeks ago, through the medium of this journal, but the following note would indicate that he is not wanted:—

GALVESTON, Texas, May 5th, 1876.

EDITOR FOREST AND STREAM:—

Fred Mather said he would make arrangements for the alligator, but has not done so. He is the biggest coss you ever saw. We had him out the other day. He smashed an empty flour barrel that happened to be near into splinters with his tail. I believe he would break a man's leg with one blow. I have seen them knock hogs twenty feet into a river, and go for, and drown them in a few seconds. JOS. LABADIE.

WARRENTON RIDING CLUB OF VIRGINIA.—A hurdle race will take place to-morrow, 19th instant, under the auspices of this splendid club over land given them by Murray Forbes, Esq., a lawyer of Warrenton. We have printed some articles concerning this and other Virginia clubs, and shall be able through one of their members to give a report of the several events of the coming summer. A correspondent sends a paragraph relative to the Warrenton Club. He says:—

"Gen. Payne, of Warrenton, gave me an enthusiastic account of some of their performances. The General was in the cavalry during the war, rising from being a private in the Black horse to the rank of brigadier, and is fond of a horse and hold riding. The club is intended to keep up the practice of out-door exercise on horseback; numbers about eighty members, and is in a flourishing condition. A good many Englishmen are members, and are, according to the General's statement, fearless riders. Young Green, who won the hurdle race, lost a stirrup at the first hurdle, but went through the race with but one, and came out ahead at the last. The last ditch was twelve feet wide, three or four feet deep, and placed next a hurdle four or five feet high, so the horses had to make some good leaps. I asked the General if twelve feet wasn't rather longer than necessary just to teach riding; 'well,' said he, 'the English fixed it that way, and said that was the style in the old country, so we couldn't back out, and our Fauquier boys would have tried anything their English friends had fixed.' The club gives cups and such prizes as will be valued for what they indicate and not for their money value. Some of the English ladies near Warrenton accompany their husbands across country in their rides, and for ordinary fence do not stop but go over; of course their horses are well trained, but it is more than our Virginia girls do in this Centennial year. In the hurdle race mentioned above two Fauquier riders took first two prizes, an Englishman took the third. T. W."

—The following delegates will represent the Central City Club of Syracuse at the State Convention: James Manning, George W. Edwards, N. C. Hinsdale, Lucius Moses, and H. Soule. Alternates—John A. Nichols, Frank Denison, G. W. Baxter, R. B. Hannon, and Frank B. Klock.

The Rifle.

FOREST AND STREAM HANDBOOK FOR RIFLEMEN.—This little book, which is now in press and will be ready for delivery in a week or ten days, fills a want that has long been felt. We are in constant receipt of inquiries for a book which will contain not only the information necessary to instruct the rifleman in his practice, but which shall also assist in the formation of clubs, by giving the requisite forms of by-laws and constitution. The FOREST AND STREAM HANDBOOK not only contains all this, but also a description of the paraphernalia required, the cost, etc., together with a list of rifle clubs and their officers. One of our leading authorities pronounces it to be the best and most concise book of reference that he has seen. The editor and compiler is Major Geo. O. Starr, Secretary of the American Rifle Association. It is embellished with cuts of Wimbledon and other ranges, and is handsomely bound. The price of the book will be but fifty cents, and accompanying each copy are a number of new and novel score cards.

CREEDMOOR.—The matches at Creedmoor on Saturday last comprised one at long range for the Hepburn Trophy and another at 200 yards, off-hand, for the *Turf, Field, and Farm* medal. The day was very unfavorable for rifle practice, the wind blowing almost a gale, first from the west across the line of fire and afterwards from the northwest. In the first match there were twenty entries, the conditions being fifteen shots at 800, 900, and 1,000 yards. Major H. S. Jewell was the winner with a score of 179 out of a possible 225 points. The leading scores were as follows:—

Yards.	Score.	Total.
H. S. JEWELL.		
800	5 5 3 5 5 4 5 5 4 4 4 5 2 5 4	65
900	2 4 5 5 4 5 3 5 3 2 3 4 5 4 4	58
1,000	4 4 5 2 3 5 5 4 3 5 0 5 3 3 5	56—179
R. RATHBONE		
800	5 5 2 4 5 5 4 4 3 5 4 3 4 4 5	62
900	4 3 3 5 2 5 5 3 3 3 5 3 5 2 2	53
1,000	0 4 5 4 5 5 5 4 0 3 5 5 5 3 3	55—170
W. B. FARWELL.		
800	5 3 4 5 5 5 5 3 5 5 2 3 5 3 4	61
900	5 3 5 3 4 4 4 3 2 5 3 3 4 3 3	54
1,000	3 4 4 3 5 4 4 5 2 4 5 3 3 4 0	53—168
A. ANDERSON.		
800	0 2 5 2 3 2 5 5 4 5 5 5 5 5 3	55
900	5 4 4 4 3 3 4 0 3 5 5 4 5 3 5	57
1,000	0 5 4 4 5 5 4 5 5 0 3 2 5 2 3	52—165

For the short range match there were about forty entries, the winner being Mr. D. F. David. The best scores were made by the following gentlemen, the conditions being 10 shots each at 200 yards off-hand:—

Name.	Total.	Name.	Total.
D. F. David	41	J. L. C. Clark	39
F. H. Holton	41	I. L. Allen	39
L. C. Bruce	40	A. G. McCook	38
A. Pyle	40	John Beattie	38
W. Robertson	40	W. Lindsay	38
H. Fulton	39	J. W. Todd	38
J. Shand	39	A. Anderson	38
T. Lloyd	39	H. W. Gourlay	38

SCHEUTZENFEST.—The opening festival of the United Scheutzen Association will be held on the 22d, 23, and 24th, insts., at the Scheutzen Park, Union Hill, New Jersey. Prizes to the amount of $1,500 will be offered for teams and individual shooting. The team match, open to seven men each from all rifle corps, will be shot on the last day; entrance, $15 for each team, to be paid to H. Raschen, No. 146 West street, N. Y., on or before the 20th inst. Gold medals will be the prizes.

GLEN DRAKE.—We have received the programme of the spring meeting of the American Rifle Association, to be held at Glen Drake, commencing to-day and continuing on the 19th and 20th. The following is the programme in full:—

FIRST DAY

All-Comers' Match.—Conditions—Distance, 200 yards; position, off-hand; rifle, any within rules. Entrance fee, $1. Five scoring shots. Military rifle, 50 calibre, allowed five points.

Military Match.—Conditions—Same as above with military rifle.

Subscription Match.—Conditions—Same as above.

Entries in above matches close at one o'clock, P. M.

Glen Drake Match.—Conditions—Distance, 500 yards; position, any; rifle, any within rules; ten scoring shots; military rifle, 50 calibre, allowed ten points. Entrance fee, $1.50.

Subscription Match.—Conditions—As above; military rifle, allowed five points.

Officer of the day, Capt. Porter.

SECOND DAY.

Mid Range match.—Conditions—Distance, 500 yards; rifle, any within rules; position any; ten scoring shots. Entrance fee, $2; military rifle, 50 calibre, allowed ten points.

Subscription Match.—Conditions—As above, five scoring shots; military rifle, allowed five points.

Entries in above matches close at one o'clock, P. M.

Field Match.—Conditions—Distance, 600 yards; rifle, any within rules; position, any; fifteen scoring shots. Entrance fee, $2; military rifles allowed fifteen points.

Subscription Match.—Conditions—As in Field Match; four scoring shots.

Officer of the day, Capt. Robbins.

THIRD DAY.

De Peyster Badge Match.—Value, $300. Presented by Gen. J. Watts De Peyster. First winner, Capt. C. F. Robbins; second winner, Lieut. J. A. Gee; third winner, F. Backofen. Conditions—Distance, 300 yards; position, off hand; military rifles, 50 calibre only. Open only to members of National Guard in uniform. Seven scoring shots. Badge must be won three times before property passes. Entrance fee, $2.

All-Comers' Match.—Conditions—Distance, 300 yards; position, off-hand; rifle, any within rules; seven scoring shots. Entrance fee, $1.50; military rifles allowed seven points.

Subscription Match.—Conditions—As above; five scoring shots; military rifle, allowed five points.

Officers of the day, Capt. Chatfield.

CONNECTICUT.—A challenge appears in the Hartford *Times*, intended for Hartford riflemen, proposing a friendly match at 500 yards between teams of four or six from New Britain and Hartford. If the proposal means business, the match can probably be arranged by conferring with Major L. A. Barbour, Secretary of the Connecticut Rifle Association. The range at Berlin will be in order by the end of the week, and the only question would be as to the selection of a day. The date proposed by the New Britain club is objectionable, because a match occurs at Creedmoor on that day which several Hartford riflemen expect to attend.

SYRACUSE.—The Sixth Division Rifle Association announces a programme of nine matches for the spring meeting of the association, to occur at their range at East Syracuse in a short time.

MASSACHUSETTS.—The Mt. Washington Rifle Club, of Haverhill, had their regular shoot on the 14th. The usual Creedmoor target for 200 yards was used. The following is the score. Distance, 200 yards, off-hand, 10 shots. A very high wind was blowing:—

Name.	Score.	Total.
John Manners	4 4 4 4 5 4 5 4 3 4	41
J. F. Abbott	2 3 4 3 4 4 3 4 5 4	36
M. A. Hill	4 3 3 3 4 4 3 4 2 3	33
C. A. Kimball	4 2 0 4 5 3 3 4 3 3	31
W. S. Willey	2 2 4 4 4 0 2 4 0 0	22

RHODE ISLAND.—The second and third stages (600 and 200 yards) of the third competition for the Rhode Island Amatuer Club championship badge, were shot off, Saturday, May 6th, at the Blackstone Range, Valley Falls, Rabbeth coming out ahead again in an aggregate of 119 out of a possible 150. The next highest scores were Crowell, 137, and Keyes, 103. This completes the series of matches for the badge, Rabbeth having won it for the third and last time, in three consecutive competitions. The following is the aggregate scores at 600 and 200 yard ranges out of a possible 50:—

Name.	600 Yds. Total.	200 Yds. Total.	Name.	600 Yds. Total.	200 Yds. Total.
Rabbeth	48	42	Keyes	41	37
Crowell	45	42	Howe	37	35
Davison	41	38	F. Z. Freeman	26	40

MINNESOTA.—A rifle club has just been organized at Rochester, in this State, with the following officers:—President, E. C. Cross; Vice President, George Leonard; Secretary and Treasurer, T. B. Kellog. There are now some twenty-seven members in the club, and they have a four hundred yard range. Friday afternoon is the regular practice day, and we hope soon to record some handsome scores.

NEW ORLEANS.—The New Orleans Rifle Club have moved to their new range. At their last meeting the members experienced great difficulty in shooting, in consequence of the wind, which was blowing quite strong when the shooting commenced, and there was also a great deal of rain during the day, neither, however, stopped the shooting for a moment. Below are the principal scores:—

Centennial target, 25 half inch rings, off hand. A. Wattenhofer scored 179; Jules Piffant scored 155. Rest target—25 half inch rings—R. G. Eyrich, 21, 24, 23, 19, 21, 20, 24, 20, 18, 20—210. R. G. Eyrich, 22, 23, 25, 23, 22, 22, 21, 22, 21, 23—224. Wimbledon target, off-hand, ten shots—Jules Piffant scored 45; A. Wattenhofer scored 46.

GUSIE.

CALIFORNIA.—A match at 200 yards, between Chas. Le Breton, Chas. Burgaus, and Chas. Nash, of the Nationals, First Infantry, and Chas. Thierbach, W. Wagner, and Mr. Lukes, of the Fusileers, Second Infantry, came off on the 23d ult. at San Bruno, at the range of the San Francisco Cadets. The terms were forty shots each, with two sighting shots, guns to be wiped at the close of each ten shots, highest aggregate score to win. Mr. T. E. Carson, of the Sumners, acted as judge, and Capt. Cantus and Lieut. A. W. Hanna kept the scores. The following are the scores:—

Score.	Total.	Score.	Total.

THE INTERNATIONAL MATCHES.—Dispatches from London state that the Scottish small-bore marksmen have recently held a number of meetings at Edinburgh and Glasgow for the purpose of maturing arrangements for the selection of a team to represent Scotland at the American Centennial rifle match. Col. McDonald, of the Queen's Edinburgh Rifles, Volunteer Brigade, and Sheriff of Inverness-shire, has been elected Captain of the team, Col. Wilson, of the Sturlingshire Rifle Battalion, Adjutant. It has been determined that the team shall form a camp at the Centennial match, and already $3,000 has been privately subscribed to assist in defraying the expenses of the trip. About twenty of the crack shots of Scotland have signified their intention of participating in the competition for the selection of the team, and more are expected when the shooting begins. Two sets of trial matches will be shot, each extending over two days. The first will take place simultaneously with the Elcho Shield trial, on the 13th and 14th of June, at Cow Glen Ranges, near Glasgow, and the second on the 26th and 27th of June, at Capelhie, in Renfrewshire. Every competitor will fire fifteen rounds at 800, 900, and 1,000 yards each, and the ten highest aggregate scores in the three out of the four days' shooting will be chosen to go to America, eight as the team proper with two reserves. The team will leave Liverpool on a Cunard steamship July 19th; this line only charging single fare for the round trip.

—At a recent meeting of the Hudson River Rifle Association at Poughkeepsie a new lease was executed for one year upon the land occupied as its range, near that city. The association now proposes to erect targets to be used at 200, 500, and 1,000 yards distance, and make additional improvements under the supervision of Col. John Bodine.

—The challenge of the Forty-Ninth Regiment, Hastings Rifle Club of Belleville, Ontario, to the Forty-Eighth Regiment in Oswego to send a team of six to Bellville on the 24th instant, to compete with a team from the first named regiment, has been accepted.

—A Syracuse rifleman proposes a novel kind of challenge for the consideration of sportsmen generally. He proposes to shoot a twelve-inch pistol against any breech-loading rifle—sights and rests unrestricted. The only restriction imposed is, that the breech-loader shall be loaded at the breech. Distance from ten to twenty rods.

—The Lancaster County Rifle Association of England, will give prizes to the amount of $8,000 at its spring meeting, and the Liverpool Rifle Association will offer prizes valued at $6,000 at a similar meeting, which will occur during the same week, and yet the National Rifle Association does not recognize them as "organizations."

A NEW RIFLE SIGHT.

SPRINGFIELD, Mass., May 8th, 1876.

EDITOR FOREST AND STREAM:—

I send you a little bit of vegetable ivory to show what I think to be the best kind of front sight, to be used with a peep rear sight. It should be thin, so as to be transparent when the light is from the front. After a great deal of experimenting I find no substance so good as *vegetable* ivory for the purpose. The perpendicular black line I make by cutting in with a thin saw and filling with black varnish (shellac, alcohol, and lampblack). It can be used open, but I inclose it in a large, narrow globe to prevent its being injured. The sight, of course, is taken from the top of the black line. It makes a very fine sight, the best, in my opinion, for target shooting or hunting.

To clean metallic shells, I immerse them in water of ammonia diluted with several times its volume of boiling water, and especially if they have collected the green verdigris, there is nothing better to remove it.

WM. GOLDTHWAIT, P. O. Box 555.

[We think that Mr. Goldthwait has hit upon a very excellent sight and shall take pleasure in showing the one forwarded to us to prominent riflemen.—ED].

The Kennel.

—We would call attention to the advertisement in another column of a pair of fine young pointers for sale by Mr. T. P. Cantwell, of Brainard, Minnesota. Intending purchasers can rely upon this stock being as represented.

—Mr. E. A. Herzberg's setter Jessie, second prize winner at Springfield, 1876, has visited Mr. Charles Raymond's Pride of the Border.

—Mr. Schuchardt's Fan, winner of second prize at Springfield, has whelped a fine litter of black pups by Dr. Strachan's Shot. Shot is out of Peg by George, and Fan is out of an imported bitch by Mr. Schuchard's Tom, winner of first prize at Springfield, this year. Fan is now in Dr. Webb's kennel at West Springfield.

—Dr. Webb's Whisky has visited Geo. A. Strong's champion dog Pete: the progeny should be fine.

—Squire Horace Smith, our Field and Kennel Editor, last week forwarded by rail to Chas. Kaeding, of San Francisco, a splendid brace of thoroughbred, stylish black and tan setters, dog and bitch, Belt and Bell. Both are good, staunch, well-broken dogs, and first-rate retrievers. Bell goes out in pup to the famous Gordon setter Fritz, owned by Edward Howe, Esq., of Princeton, N. J., which dog has proved himself to be a very superior one for stock purposes, consequently the purchaser of Belt and Bell will have a brace of black and tan setters equal to any in this country.

—J. Aretas Clark, 359 and 361 Market street, Newark, N. J., claims the name of Frank for his setter dog, orange and white, and ticked with orange, by Forman Taylor's one-eyed dog Sancho, out of his orange and white bitch Fanny, whelped July 12th, 1876.

A HANDSOME CHROMO.—Our readers will remember a picture of three celebrated dogs, Don, Peg, and George, after a painting by Mr. H. C. Bispham, which ornamented our columns some time ago. This picture has appeared again in the shape of a handsome chromo-lithograph, one of the best we have ever seen. In size it is 30x20 inches, and when framed is almost as handsome as an oil painting. The price is remarkably low—only $3—and the publishers Messrs. Strobridge & Co., of Cincinnati. We have often urged the publishing of these pictures of celebrated dogs in the shape of chromos, and trust that Messrs. Strobridge & Co. will continue to issue them.

WARTS IN A DOG'S MOUTH.—A correspondent writes us from Providence, R. I., as follows:—

"I notice in answer to correspondent "C. S. J., Cambridge," you say warts in a dog's mouth is a new thing to you, and that you know no remedy. Mr. Wm. Murray, of this city, had two afflicted with those excrescences, and if C. S. J. would write him I know he would be pleased to tell him what he did, and how his remedy worked."

THE SHREWSBURY (ENGLAND) FIELD TRIAL.

THIS event, so fraught with interest to the breeders of sporting dogs, was brought to a very successful conclusion over the Ensdown estate, near Shrewsbury, England, on the 25th, 26th, and 27th ult. Most of the gentlemen whose names are well known in this country as breeders of fine dogs were present, the list including Mr. Lloyd Price, Mr. Barclay Field, Mr. Arthur Lloyd, Mr. Lonsdale, Mr. Statter, Mr. Llewellin, Capt. Bennett, Mr. Lort, Mr. John Lort, Mr. Whitehouse, Mr. T. Pilkington, Mr. G. Pilkington, Mr. F. Moncton, M. P., Mr. S. Price, the Rev. J. Bridgeman, the Rev. J. Sargeantson, the Rev. J. C. Macdona, Mr. G. de Landre-Macdona, and others.

The birds the dogs were worked on were partridges, and the gun was used, although of course not on the birds. The first event was the pointer puppy stakes of five guineas each, first prize £20; second, £10; third, £5, which resulted as follows:—

Mr. Price's liv. w. b. Whim beat Mr. J. H. Whitehouse's lem. w. b. Lady Blanche.

Mr. G. Pilkington's liv. w. b. Fancy beat Mr. F. Moncton's liv. w. b. Romp.

Mr. E. Bishop's liv. w. d. Roy beat Mr. Garde's liv. w. b. Nellie.

Duke of Westminster's liv. w. d. Don beat Mr. R. Lloyd Price's liv. w. d. Lucky Sixpence.

Duke of Westminster's bk. w. b. Jewel beat Mr. Whitehouse's lem. w. Bray.

In the ties Fancy beat Jewel, Roy beat Whim, and Fanny beat Roy, taking first prize. The next event was the Sun-

doroe stakes of seven guineas each for all-aged pointer dogs; first prize £50; second, £25; third, £16. The following is a summary:—

Mr. R. Lloyd Price's liv. w. d. Drake beat Mr. Lort's liv. w. d. Nasso.
Mr. Lonsdale's liv. w. d. Czar beat Mr. Price's liv. w. d. Bow.
Mr. S. Beckett's bk. w. d. Rector beat Mr. R. Lloyd Price's liv. w. d. Eos
Capt. Bennett's lem. w. d. Tuck against Mr. W. Beckett's liv. w. d. Prince.
Mr. H. Whitehouse's liv. w. d. Rapid beat Mr. S. Price's liv. w. d. Mike.
Viscount Downe's liv. w. d. Bang against Mr. R. L. Price's liv. w. d. Beau.
Mr. W. Arkwright's lem. w. d. Tramp beat Mr. B. Field's liv. w. d. Dick.

TIES.

Tramp beat Rapid, and Mr. S. Beckett's bk. w. d. Rector, by Don out of Mona, beat Mr. W. Arkwright's lem. w. d. Tramp, by General Prim out of Wink, and won. Tramp winning second prize and Rapid third.

In the County Stakes for all-aged bitches:—

Viscount Downe's liv. w. b. Jill beat Mr. H. G. Garde's Peg.
Mr. W. Dunn's lem. w. b. Rose beat Mr. R. Price's Romp.
Viscount Downe's liv. w. b. Grace beat the Duke of Westminster's liv. w. b. Sal.
Viscount Downe's liv. w. b. Grace, by Drake out of Nell won; second, Duke of Westminster's Sal.

This finished the first day's proceedings. On Wednesday the ball was opened with the County Stakes for braces of both pointers and setters, the first prize being worth £50. Sixteen braces were entered, the names of many fashionable dogs being prominent. Among them were the Laveracks Daisy and Dash II., both by Blue Prince, a son of Pride of the Border. Mr. Llewellin's Countess Bear and Countess Moll, both by Dan out of Countess. Mr. Macdona's Ranger and Magic, and others. The trial was won, however, for the third time by Mr. S. Price's pointers Baug, and Mike, by Bang, Dash II. and Daisy being second. The breaking of the old pointers was said to be perfection. In the setter puppy stakes there were ten engaged, as follows:—

Mr. W. Lort's lem. w. Glen, by Ranger, 15 months, against Viscount Downe's bk. w. tan Young Sam, by Sam—Bess, 15 months.
Capt. Bennett's bk. w. Tuc, by Prueg—Prue, 11 months, against Viscount Downe's bk. w. tan Dan, by Sam—Flash, 14 months.
Mr. John Armstrong's bk. w. Prince, by Sam—Kate, 12 months, against Mr. Thos. Statter's Grouse, by Rob Roy—Belle, 14 months.
Mr. C. S. Fauntleroy's bk. w. Pound, by Prieg—Princess, 15 months, against Mr. H. P. Garde's bl. Belton Belle, by Tom—Kate, 12 months (dis).
Mr. Thos. Statter's Sal, by Belton—Betsy, 15 months, against Mr. Barclay Field's bk. w. Belmont, 11 months.

II.

Sal against Pound.
Dan against Pound.
Sam against Belmont.
Prince against Glen.
Young Sam, first prize; Belmont, second prize; Glen, third prize.

All of these puppies were to have run again on the 4th and 5th inst., in the Kennel Club Field Trials at Linton, Cambridgeshire. The next stake was one in which all the celebrities were entered, viz. The Attingham Stakes, for aged dogs, at £7 7s. each; first prize £30 and £10 added money, second prize £20, third prize £8:—

Mr. J. A. Pledger's bk. w. tan Rhyl, by Ranger—Cora, 1 year 11 months, against Mr. R. Lloyd Purcell Llewellin's Count Dao, by Dan—Countess, 2 years 3 months.
Mr. J. Armstrong's bk. w. tan Dash II., by Blue Prince—Kate, 2 years, against Mr. A. P. Lonsdale's bk. w. Rake, by Rake—Spree, 3 years 1 month.
Mr. G. se Landre Macdona's bk. w. tan Ranger, by Quince II—Judy, 5 years, against Mr. A. P. Lonsdale's Spanker, by Frank—Bess, 2 years.
Mr. Statter's Frolic, by Frank—Bess, 2 years 3 months, against Mr. J. Pilkington's liv. and tan w. Rufus, by Ranger—Cora, 2 years.
Mr. R. Field's Rake against Mr. R. Lloyd Purcell Llewellin's liv. and w Sam, by Sergeant—Kate.

II.

Dash II. beat Field's Rake.
Field's beat Lonsdale's Rake.
Mr. J. Armstrong's Dash II., first prize; Mr. Field's Rake, second prize; Mr. Lonsdale's Rake, third prize.

The next event was the Shrewsbury Stakes, for aged bitches, at £7. 7s. each; first prize £24 and £10 added money, second prize £17:—

Mr. G. le Landre Macdona's r. Magic, by Mozart—Brosna, 2 years, against Mr. R. Lloyd Purcell Llewellin's o. w. Countess Bear, by Dan—Countess.
Mr. B. Field's bk. w. tan Daisy, by Dash—Daisy, 4 years 1 month, against Mr. R. Lloyd Purcell Llewellin's Countess Moll, by Dan—Countess, 2 years 3 months.
Mr. Thos. Statter's bk. Daisy by Don—Daisy, 3 years 3 months, against Mr. R. Lloyd Purcell Llewellin's Nora, by Dan—Nelhe, 1 year 8 months.
Mr. Lonsdale's Romp was drawn.
Mr. Llewellin's Countess Moll, first prize; his Countess Bear, second prize.

Regarding this trial the *Field* says: "In a grass field Countess Bear made a beautiful point, the red bitch backing her in fine form; but she forsook her point on the report of the gun, and ran all over the field, utterly heedless of her breaker. Further on Mr. Buckell had to put up his hand to drop her, when a hare rose, and she made one glaring false point. The decision was given against poor Magic, who won throughout, never making a mistake, and backing beautifully, though she had not luck enough to get on birds. The kennel companion of the winner of the last heat, Countess Moll, had exactly two minutes with Mr. Field's Daisy, and happened to run straight up to a brace of birds almost immediately, when she was taken up, and declared the best we had seen, Nora, when down with Mr. Statter's black bitch, Daisy, did not show the pace and style of the previous day, and missed some birds she ought to have found. In a field of thick clover she and Daisy, racing along together, ran up two lots of birds in succession, and the judges soon after gave first and second prize to the Wellesley kennel."

The closing event was the Champion prize for winners, for which there were five entries: Dash II. beat Grace, Countess Moll beat Young Sam, Dash II. beat Rector and Countess Moll. Winner of the Plate, Mr. J. Armstrong's Dash II., by Blue Prince out of Kate, 2 years.

Regarding the winner *Bell's Life* says: "The winner of the Champion Cup, Dash II., is a very handsome dog, very low and leggthy, and of quite the true Laverack type. Although quite a young dog he has won many prizes at shows, and his pedigree quits confirms the opinions that I have constantly expressed in these columns—namely, that the best setters are the Laveracks, and the nearer they are bred to that strain the better. Dash II. is very nearly a pure Laverack, as he is by Blue Prince, a son of Pride of the Border. American sportsmen will be pleased to hear of this victory, his dam being Kate, by old Blue Dash out of a bitch with Laverack blood in her, so Dash II. may be fairly called a Laverack with the slightest stain of outside blood in him.

FOOD FOR DOGS.

We are in receipt of the following letter from Mr. L. R. Cassard, of Baltimore, Md., a gentleman of much experience in field sports. Food prepared according to the directions given would certainly be very substantial and easily carried by shooters and hunters on their trips, and even for home consumption would be quite economical and wholesome:—

BALTIMORE, May 13th, 1876.

EDITOR FOREST AND STREAM:—

For those sportsmen who desire to take dog feed from home, thus avoiding the difficulty and trouble of procuring it while on their hunting trips, the following, I think, "will fill the bill." I made a lot about two months ago, and last week it was as sweet as the day on which it was cooked. Ten pounds corn meal; five pounds oat meal; five pounds lean beef, cut in very small pieces; one drachm salicylic acid. Boil the meal and beef together, and when nearly done add the acid, it is best to dissolve it in, say a pint of water. I think a less quantity, even, of the acid will do, although in almost any quantity it is harmless. Of course the ingredients are with the person making the cake, as he can make it of whatever material he thinks fit; the above, however, is a good diet and cheap. Make into loaves or cakes. You are at liberty to use this, and I trust some of your friends will give it a fair trial.

L. R. CASSARD.

THE DACHSHUND.

MUNICH, April 1876.

EDITOR FOREST AND STREAM:—

In reply to Fr. von Ivernois, I would simply say, that if he will take the trouble to turn to the October 14th number of FOREST AND STREAM, he will find the following, under the head of the Champion Dachshund: "He has ugly tricks, too. If he finds a dead or wounded animal, he will help himself to a goodly meal, and when he thinks I do not take him out often enough he will go out alone, visit the burrows, and hunt for days after hares and deer."

Now, as Fr. von Ivernois writes that he pays his gamekeeper to shoot dogs of that kind, I tremble for the champion. Dachshunds are of all colors from white to black, but those most preferred are the black and tan without any white at all. The dachshunds were originally, and are still, short behind (the floor the coat the better), bow-legged thick fellows, and if your friend in Leipzig has found a long-haired race of dachshunds, he will confer a favor on all sportsmen and myself by submitting to us his evidence.

W. G. M.

ANOTHER CURE FOR MANGE.

UTICA, April 28th, 1876.

EDITOR FOREST AND STREAM:—

I see in almost every number of the FOREST AND STREAM that you have application for a remedy for the cure of mange in dogs. Last fall I purchased a setter pup, the person from whom I bought the dog agreeing to keep him till he was five months old. Well, the dog arrived according to agreement. I had in the meantime requested the gentleman to inform me what kind of food the dog had been used to. The information came. The food used by him for all his dogs was Indian and oatmeal in equal portions, boiled, and mixed with a little milk, or gravy, and some meat also boiled; chopped fine and stirred in. Very good food, no doubt, but rather heating, especially when fed to young dogs. The consequence was the food used, combined with a dirty kennel, caused the dogs to have the mange very bad. Now for the remedy: Take one ounce of oil of tar, one ounce lac sulphur, four ounces of sperm oil; mix and rub well into the parts affected. This remedy is a certain cure for mange in all cases. My dog was completely cured by three applications only—one application once in every three days. I washed the dog before the first and every application with soap and warm water, the soap being well rinsed out each time, and the dog well dried before the mixture was applied.

I trouble you with this communication because I know the remedy to be good, having seen it used in a number of cases, and always resulting in a cure. Sometimes two applications only are needed, and I never knew of more than four being required.

THOMAS BIRT.

STRATFORD, May, 1876.

EDITOR FOREST AND STREAM:—

Having frequently seen in your valuable paper inquiries from correspondents how to cure the mange, I send you this result of my friend Mr. J. Peck's experience. A setter dog belonging to him having had it two seasons, and being useless the second year for hunting on account of having the mange so badly, was cured by my friend Peck. He having tried some of the best remedies he had read of without effect, lastly, thought he would try kerosene oil, applying it every other day for two or three weeks, at which time the disease disappeared and the hair grew rapidly. One of my neighbors also had a dog which had it for three years; he used the kerosene oil. The disease disappeared and the hair has all grown out. Also a hound of my friend Peck's, three weeks ago, had the red mange back of fore leg; three applications and the disease disappeared and the hair is growing.

If you or any of your friends will try this, I am sure they will find it a sure remedy. One advantage is, the dog it not apt to lick it. We apply the kerosene with a cloth or brush.

J. C. B.

Game Bag and Gun.

MAY IS A CLOSE MONTH FOR GAME.

—Mr. Robert Davies, of the Toronto Gun Club, sends an account of a deer hunt, which we have not space to publish in full. It details the adventures of a party of eight gentlemen, who went into the bush with a cook and camp equipage, starting from Toronto on the 13th of November last and returning on the 25th, having secured more venison than they could eat throughout the whole winter. Their hunting ground was some ten miles from the Victoria Road Station, on the Toronto and Nipissing Railroad, and about ninety-five miles northeast from Toronto. The relator tells a story of how a country storekeeper named Sutherland sued the cook for fifty cents for a broken lamp, and finally had to pay his own costs and $110 additional! The result was considered a good enough joke on the merchant to print in the city papers.

MASSACHUSETTS—*Salem, May 8th.*—I saw a fricud the 6th who tells me that week before last he shot thirty-six snipe near River Hamilton. This is high line. The shooting has been poor enough this spring, and sniping has been rather discouraging sport. A good bunch of winter yellow legs went along yesterday P. M. Uplands, teeters, peeps, and solitary sandpipers also have arrived. Bitterns and herons are represented, but I have not seen a person who has seen the regular spring flight of geese.

TEAL.

OHIO—*Ashtabula, May 4th.*—Messrs. Jerry Cutler, engineer on the Lake Shore Railroad, and W. C. Haskell did some tall shooting, having within five hours shot no less than forty-two English snipe.

J. C.

PIGEON MATCHES.

—A match was shot on Saturday last at Dexter's Park between teams from the Long Island and Furman Island shooting clubs. The Long Island team won by three birds, the conditions being ten birds to each man, 21 yards rise, 80 yards boundary, Long Island rules to govern. The following is the complete score:—

LONG ISLAND CLUB.

Name.	Innings—1st	2d	3d	4th	5th	6th	7th	8th	9th	10th.
Winget	0	1	1	1	1	1	1	1	1	1—9
Talbot	1	1	1	1	0	1	1	0	1	0—7
Thomas	0	0	1	1	1	0	1	1	1	1—7
Gilmersleeve	1	1	1	1	1	1	0	1	1	0—8
Blanco	1	1	1	1	1	0	1	1	1	1—9
Total	3	4	5	5	4	3	4	4	5	3—40

FURMAN ISLAND CLUB.

Name.	Innings—1st	2d	3d	4th	5th	6th	7th	8th	9th	10th.
Muller	0	1	1	1	0	1	0	1	1	1—7
Evans	1	1	0	1	1	1	1	1	1	1—9
Primrose	1	0	1	1	1	1	1	1	0	1—8
Carrick	1	0	0	1	0	1	1	1	1	1—7
Kellett	1	0	1	1	1	1	0	1	1	1—8
Total	4	2	3	5	3	5	3	4	4	5—37

Referee—Dr. Wynn, of the Long Island Club.

—The Monroe County Sportsmen's Club held a pigeon shooting tournament for gold medals on the old Fair Grounds at Rochester on the 12th inst. The members of the club were out in force and the meeting was a decided success. In the first match, at single birds, the score was as follows:—

Name.	Total.	Name.	Total.
J. H. McGuire	7	W. J. Babcock	7
J. Gifford	9	L. A. Pratt	8

E. V. Stoddard	3	J. H. Jeffris	6
C. C. Morse	7	C. A. Hayden	6
M. Ward	7	C. Livingston	9
E. B. Pope	7	P. W. Little	5

Of those who tied on 10 birds, Mr. J. K. Beckwith lived the longest, killing 5 more and won first prize. After two ties with Mr. H. C. Remington, Mr. M. M. Morse won second prize. Mr. J. H. Brown took third prize, and Mr. C. C. Morse fourth. Following this match was a double bird match resulting as follows:—

Name.	Total.	Name.	Total.
C. E. Linton	7	W. H. Bowman	13
A. B. Lamberton	12	H. Walzer	11
W. G. Antony	11	C. Morse	12
H. B. Hooker	14	E. T. Curtis	10
J. K. Beckwith	14	J. Brownell	15
J. H. McGuire	8	H. H. Morse	14
E. S. Combe	8	F. Chaffey	11
W. A. Lyons	11	C. A. Dayden	12
N. Davis	11	W. J. Babcock	13
Geo. W. Crouch, Jr.	17	M. Ward	12
J. H. Brown	15	H. S. Miller	13
E. O. Sage	8	E. B. Pope	16
Seth Green	12	L. E. Raymond	9

Mr. Geo. W. Crouch, Jr., winning. Mr. E. B. Pop took second prize, Mr. J. H. Brown, third, and Mr. Henry Walzer, fourth.

ST. LOUIS, May 9th, 1876.

EDITOR FOREST AND STREAM:—

The long talked of contest at the trap between the St. Louis Gun Club and the Quincy, Ill. Shooting Club, came off at Singleton Park, Quincy, Illinois, Monday, May 8th. The grounds are owned by General Singleton, and freely placed at the disposal of the Quincy Club for their practice or club shooting. After the match between St. Louis and Quincy, the General entertained both clubs, and at least 100 of their friends at dinner at his elegant hotel situated on the grounds. The feast was enjoyed by all present, and especially were our St. Louis visitors loud in their expressions of satisfaction at the splendid manner in which they were received and treated during their stay, by Gen. Singleton, the Quincy Shooting Club, and the citizens of Quincy generally. The contest was one for honor, and thoroughly enjoyed by all present. The shooting was good, as will be shown by the scores below, named in the order in which they were shot. The St. Louis Club have demanded an immediate return match that they may be permitted to show their appreciation by way of reception of the Quincy people:—

QUINCY SHOOTING CLUB, QUINCY, ILL.

ST. LOUIS.

PENNSYLVANIA.—The Sportsman's Association of Western Pennsylvania, celebraied the opening of the Centennial on the 10th inst., by a grand pigeon shooting tournament at Wall's Station, some sixteen miles from the city of Pittsburgh. The principal match was for the club trophy, a silver cup, the conditions being ten birds each, 21 yards rise, with a recovery limit of three minutes; the birds being wild pigeons. The following is the score:—

Name.	Total.	Name.	Total.
McDowell	6	S. Williams	6
Lindsey	4	J. F. Umbstaetter	3
Dalzell	8	Fred Kennedy	7
Thomsen	1	Harper	5
Woolsey	9	Carpenter	9
Bugbman	5	O'Neil	3
Schoonmaker	5	L. D. Hunt	3
Leech	4	W. Kenaedy	8
Cook	6	S. Williams	5
Reno	7	R. T. Hnat	8
Dyer	4	Hartley	6
Dickson	4	Daly	7
Orth	8	Carpenter	3
Lytle	9	Phillips	5

The highest scores were made by Mr. Carpenter and Mr. Woolsey, each of whom killed nine birds out of a possible ten, and the tie shooting between them was watched with interest. In shooting off the tie each was given three birds. Mr. Woolsey shot first. His birds were very lively, and he killed them in excellent style; all of them dropping within a radius of ten paces from the trap. Mr. Carpenter killed two of his birds, and hit the third hard, but he could not recover him in time, and the laurel went to his competitor, who, by the way, shoots through spectacles, and whose score during the day transcended the amateur standard.

In the double bird match which followed there were nineteen competitors, at three double rises. Messrs. Cook and Orth killed all of their birds, and in shooting off the tie the latter won. Mr. Orth also won a pool at five birds each, killing his quota atright. A similar match closed the meeting, Mr. Woolsey being successful after shooting at thirteen birds to decide the ties.

PROTECTING MIGRATING WILD-FOWL.

ST. LOUIS, Mo., April 25th, 1876.

EDITOR FOREST AND STREAM:—

Let us protect the migratory birds by all means, but to prohibit the killing of wild-fowl during the spring flight would be as absurd as a total prohibition. It has been said that if ducks are shot at indiscriminately during their northern voyage, the survivors will choose another route on their return. This is erroneous, as I will endeavor to demonstrate. The sea-fowl of the New England coast are shot at continually during April, and late into May after they have paired, from every headland, and on every favorite feeding place, yet the birds have never changed their route; and so far from decreasing in numbers, many can corroborate me in saying that they were as plenty last year as fifteen years ago. Here in Missouri, there are no ducks in greater numbers during the spring migration than the sprig-tails, yet they return South in the autumn by another route. It cannot be because the guns of Missouri and Illinois make more havoc than those in other parts of the country, for they come back in undiminished numbers the following spring. Canvas-backs have been unusually plenty here this spring, but does any one suppose that it is because some other route has been deserted for this? It is true, however, that the fusilade kept up in the spring has driven many birds to seek other places for breeding, often not so favorable for their increase.

I am strongly opposed to both total prohibition and to unlimited license in shooting water-fowl, and believe that some restrictions well enforced would be the means of allowing the ducks to breed in a climate more conducive to propagation than that of the far northern regions to which the great majority of them now resort. Just what restrictions should be made is a matter requiring much good judgment. From Audubon's writings it may be seen that forty years ago it was no unusual occurrence for Canada geese to breed as far South as Kentucky. Many living sportsmen can remember when dusk ducks nested abundantly in New England marshes; yet now only an occasional pair breeds south of the northern part of Maine. During the latter part of May there is a flight of birds along the eastern coast, known generally as "bay snipe," among which are myriads of red-breasted snipe (*Macrorhamphus griseus*), known under various local names, such as "robin snipe," "dowitchers," "brown-backs," etc. This flight lasts but a few days, but sometimes affords fine sport. Although the eggs in the female are sometimes very large, I have never known of these birds breeding exceptin the far North, and they even seem not to stop for the purpose of feeding, although sometimes alighting to rest. Although they come from far South, their flight is so rapid that they arrive in plump condition, and are delicious to eat. As early as July these birds may be seen returning, but in scattered numbers, and usually poor in flesh, affording little or no sport. "In the resolutions of the "Monroe County Sportsmen's Club," passed at a recent meeting these words occur: "We deem it impracticable for any State to attempt to protect any kind of migratory game bird whose natural breeding grounds are not within the limits of said State." I heartily approve this, and believe that it would also be undesirable as well as impracticable to attempt it. To protect "coots" would be as wise an act as that passed by the Maine Legislature, (last year, I think), protecting pickerel in a certain lake in that State. ROAMER.

DUCKS ON THE KANKAKEE.

PITTSBURGH, Pa., April 21st, 1876.

EDITOR FOREST AND STREAM:—

Many of our sportsmen have been off on their spring flight duck shoot to the Kankakee Marsh, Saudusky, and other regions. Among the number the esteemed President of our Sportsman's Association, Robt. Dnbzell, Esq., a veteran sportsman to whose wise and timely council the measures of success we have attained in the objects of the association are largely due. Small bags are reported as the order of the season. It is stated by many sportsmen here, but it is not in accordance with your correspondent's observations, who has been out twice this spring, that the flight of ducks, geese, etc., reached the Kankakee region during the warm weather in the latter end of March, and was then turned back south by the coming of cold weather freezing up the marshes and accustomed feeding grounds. My observations are that the flight simply scattered temporarily to the vast regions comprising hundreds of thousands of acres in Ohio, Indiana, and Illinois, freshly inundated by the storms, there feeding and resting in unusual places and pushing on after the cold snap. The spring flight, owing to the open winter, began earlier, and is, and has been mainly over for some time.

Some of the mallards killed on the Kankakee two weeks ago were birds that had mated and were nesting. SOUTH FORK.

—The following delegates were elected to represent the Otsoningo Club, of Binghamptou, at the annual meeting of the New York Sportsmen's Association: A. R. Tweedy, James S. Cary, Cyrus Clapp, George A. Kent, James Harrison.

—We are gratified to state that our valued and long-time correspondent Hon. H. B. Harrison, of New Haven, Conn., has been nominated for the office of U. S. Senator.

Yachting and Boating.

THE ERMENGARDE.—Mr. George Peabody Russell's new yacht, the Ermengarde, so named for the Ermengarde who was a Queen of Provence in the ninth century, was successfully launched on Saturday, from the yard of Messrs. C. & R. Poillon, builders of the Sappho and many other noted yachts. Mr. Russell's handsome vessel was launched with her masts stepped, and will at once be fitted for cruising. It is reported to be her owner's intention to take her to England, where she is to have boilers and engine placed in her, and to be converted into a first-class screw steamer. Should such be the case, unless she is placed under the British flag, a very interesting question will arise, and Mr. Peabody may find himself involved in a very pointed discussion with the Treasury Department. In sailing from here she carries a register as a sailing vessel, which on her return, as a steamer, or in fact upon her departure from the port of equipment, becomes invalid, and the fair Ermengarde becomes an outlaw, and a lawful prize to a cruiser of any nation who may overhaul her and demand her papers. Such, at least, would be the effect under our present revenue regulations. Perhaps Mr. Peabody may procure a modification of them to suit his peculiar case.

NEW YORK YACHT CLUB.—A special meeting of this club to consider the Canadian challenge for the Queen's Cup was held on Thursday evening. The following reply from Major Gifford to the letter sent him, stating the conditions under which the challenge would be accepted, was read:—

CONURG, Ont., Dominion of Canada, May 2d, 1876.

The Regatta Committee New York Yacht Club:—

GENTLEMEN—I am in receipt of your favor of April 21th last, setting forth the terms for the America's Challenge Cup as determined on by the New York Yacht Club. It appears to me that there are four conditions for settlement by mutual consent between the contending parties, viz.: The time for sailing the race, the course to be sailed over, the number of races to be sailed, and the number of yachts belonging to the challenged club that is to contend in the race. This latter condition is the most important of all, and from your letter of April 21th I can gather nothing as to your views on the matter. You have probably left it for future determination, not knowing but that other yacht clubs may join in the contest. It might happen, however, that my yacht, which I may say is the only one from the Royal Canadian Yacht Club that will send you a challenge, may be the only one that you will have to contend against. Should the Countess of Dufferin be the only contending yacht I should feel much obliged if you would inform me whether you would in that case match one yacht against her, or one out of four, as in Capt. Ashbury's case, or whether it is to be an open race for all the yachts of the New York Yacht Club squadron to sail against her. I ask for this information because, according to the terms on which the New York Yacht Club holds the cup the match has to be determined by mutual consent, and before assenting to the conditions mentioned in your letter of April 21th, I should like to know what the intention of the New York Yacht Club is in the matter; that is to say, how many yachts the New York Yacht Club intend to sail against the Countess of Dufferin in the match race of the cup. I have the honor to be, gentlemen, yours respectfully, CHARLES GIFFORD,

Vice Commodore Royal Canadian Yacht Club.

A copy of the deed of gift was also read, and it was resolved that the three races should be held on the 10th, 12th and 14th of July.

On motion of Mr. Kam it was resolved that in respect to the course to be sailed over the offer of the club be repeated to Major Gifford, namely—one race over the New York Yacht Club course, one race outside Sandy Hook 20 miles to windward and back, and the third, if necessary, to be chosen from either of the foregoing.

A resolution to the effect that one yacht should be selected to sail all the races was lost. It is time that the shilly-shallying regarding the conditions under which this cup shall be sailed for was ended. The action of the club is undignified in the extreme, and ere long no foreign yachtsman will care to challenge for a prize regarding which there is so much palaver and vacillation. By the way, the Countess of Dufferin, Major Gifford's yacht, was successfully launched on the 11th inst.

BROOKLYN YACHT CLUB.—The regular monthly meeting of the Brooklyn Yacht Club was held on Monday evening. The new course for first and second class yachts was decided as follows: From Bay Ridge to Southwest Spit, thence to Lightship, back to Southwest Spit, and thence to stakeboat anchored off the new club house at Gravesend Bay. For third class boats the course will be from Bay Ridge to stakeboat anchored two miles southwest of Southwest Spit, thence to home stakeboat at new club house. June 10th is the date fixed for the first regatta. It was decided that henceforth the yachts belonging to the club should carry a full set of signals, and Commodore Dillon was authorized to drill the fleet in their use. Another regulation was passed, and one which might be productive of much trouble—the compelling a junior member to salute a senior either with his ensign or gun. Such a rule is well enough in the navy, but in yachting it is carrying discipline a little too far. Five hundred dollars was voted for prizes, and regatta tickets are only to be issued to those members who are not in debt to the club. The next meeting will be on the 31st inst.

—The Argonauta Boat Club, of Bergen Point, have elected the following officers for the ensuing year: E. W. Humphreys, President; E. A. S. Man, Vice President; B. Stephenson, Second Vice President; Walter Man, Captain; W. Taylor, Lieutenant; W. F. Hobbie, Recording Secretary; H. Meigs, Jr., Corresponding Secretary; J. W. Winants, Treasurer; A. R. Warner, D. P. Cruikshank, A. W. Booth, and L. L. Spring, Trustees.

PASSAIC ROWING ASSOCIATION.—This association held their opening day of the season on Saturday, over their course at Newark, by a parade of the boats of the fleet, reviewed by Commodore W. F. Harris. The club six-oared barge led the way, followed by the Triton barge and the Passaic six-oared gig. Seventeen boats in all passed in review, the rear division being composed of single sculls. With the exception of the float on which the band was stationed getting adrift and almost drowning the musicians, no accident occurred.

CENTENNIAL ROWING.—While it appears improbable that the great English universities will join in any way in the college regatta at Saratoga, we shall still have the pleasure of welcoming crews which, if not strictly representative, will embrace some of the best oarsmen of Oxford and Cambridge. These will take part in the contests at Philadelphia. Regarding the college regatta the President of the Cambridge University Boat Club, Mr. W. B. Close, has written to the New York Associated Press Agent here as follows:—

"I have officially declined the invitation of the United Association of American Colleges to participate in the Centennial Regatta, in consequence of inability to organize a representative crew. I hope some college four will go to Philadelphia."

NAUTILUS BOAT CLUB.—The Nautilus Club held its first monthly sculling race for the season on Monday afternoon, the course being two miles straightaway on the Harlem River. There were three competitors, Messrs. Gerald McLaughlin, Frederic A. Levien, and Daniel W. Hernon. Mr. David Roache acted as referee and starter. When the word was given McLaughlin took the lead, followed by Levien, with Hernon last. For the first mile the boats kept in close company and passed McComb's Dam with Hernon in advance, Levien following closely, and McLaughlin only a short distance behind. The second mile was rowed in the same order, save that McLaughlin fell off before the upper mark was reached. They finished in the following order and time:—

	M.	S.
1—Hernon	15	20
2—Levien	15	35
3—McLaughlin	16	00

PROVIDENCE YACHT CLUB.—A club with this title has been organized in Providence under very promising auspices. The list of members comprises many of the prominent men of the city, and the following yachts are already enrolled: Country Boy, E. N. Pettis; Dolphin, B. Thurber; Glide, J. H. Borden; Hildegarde, H. L. Clarke; Hope, E. J. Anderson; Idlewild, B. Davis; Lottie, C. Handy; Minnie, R. Davis; Nettie, W. E. C. Windsor; Riviera, N. G. Herreshoff; Sarah, John Sprague; Starlight, R. W. Jenks; Sue, A. H. White; Tidal Wave, W. T. Arnold; Una, J. Borden, Jr.; Wanderer, H. J. Flint; Wilcox, N. F. Thurber.

The club has a very commodious club house, and it is provided with a float stage, which is 20x30 feet in size. This is reached by a walk 216 feet long, which is 4 feet above the water. On the water front of the building there is a platform 10x20 feet and which is covered with an awning. It has just elected the following officers for the ensuing year:—

Commodore, Harvey J. Flint; Vice Commodore, C. Handy; Captain of Fleet, Robert W. Jenks; Secretary, James F. Tiffany; Treasurer, Edward G. Anderson; Measurer, Benjamin Davis; Regatta Committee, Benjamin Stillwell, Charles Livingstone, and Simon Cameron; Trustees, Harvey J. Flint, N. F. Thurber, and Waterman Pierce.

—The regatta of the Harlem Association will be held on the 17th of June, for which great preparations are being made. The Atalantas have their new boat, and will send last year's crew, with the exception of No. 8, which position will be filled by Mr. C. A. Lyon; the other members are Messrs. Downs, Rogers, and Enslis, the latter captain and stroke. The Nassau Club have purchased from Farrow a new six-oared barge, which they will take to Philadelphia. It has three crews in training, from which the regatta crew will be selected. The New York Athletic Club has a very strong crew, comprising R. W. Rathbone, bow; Ellis Mack, H. C. West, and C. H. Cone, stroke. The Dauntless, Gramercy, and Nautilus Clubs all have crews in training, and are preparing for a vigorous campaign.

—Dispatches from London announce that the rowing and boat clubs of the Dublin University have organized a joint representative crew of four to take part in the contests at Philadelphia, consisting of Messrs. Penland and Hickson, of the rowing club, and Messrs. H. E. and C. B. Barrington, of the boat club, the latter being stroke oar.

SCHUYLKILL NOTES.

PHILADELPHIA, May 15th, 1876.

EDITOR FOREST AND STREAM:—

On Saturday the Schuylkill River had a regatta day look. The Crescent Club rowed their races from Girard Bridge to their boat house, a distance of a little more than half a mile. The first race was between two double-scull shell crews, Messrs. Steel and Witmer, and Messrs. Young and Tasker. After a sharp contest Young and Tasker won.

The next race was between the six-oared barges "Ione"—Terry (stroke) J. Harper, Cotton, Maddox, Lee, and F. Young; Hinchman coxswain—and "Falcon," Tatman (stroke) Stokes, Buice, Dougherty, Heebner, and Ridgway. After a close race the Ione won by a lead of about two seconds. The regatta closed with a single-scull race, for which Messrs. Tasker, Steel, Young, Whitmer, and Brown started.

The race was won easily by Mr. Tasker, who led by some seven lengths, the rest crossing close together in the order named.

The Undine Club's races were rowed from the Goose Pen to Turtle Rock, a little shot of one mile. First came the six-oared barges "Undine"—Scarborough (stroke) Hart, Moody, Heinlich, Wain, Bright; Roberts coxswain. "Cygnet"—Gaiahan (stroke) Wilson, Peterson, Burroughs, Conrad, Stile; goddard coxswain. The race was close until Girard Bridge was reached, when Roberts' crew began leading, which lead was increased gradually until the boats crossed the line. Undine's time 6m. 50s.; Cygnet 7m. 9s.

The four-oared shell race was interesting, not only from the closeness of the contest, but the really fine rowing displayed by both crews, an unusual circumstance in scratch races. Neither crew (which were as follows) had trained at all, other than the regular promiscuous club rowing. The "Atalanta"—Baker (stroke) C. Barnes, Besser; Roberts bow. "L'Hirondelle"—Allison (stroke) Frost, Bright; De Haven bow. The crews got off well together, and stayed together for over half a mile. De Haven got off his course, but did not lose command of his boat, and when the two crews passed under the connecting bridge the boats were level. The pace and the heavy water began to tell on Roberts' crew, which were very light, the L'Hirondelle going to the lead, and running in 5m. 54s.; Atalanta 6m. 3½s. For the Undine regatta Com Jas. M Ferguson acted as starter and umpire. Mr. Wm. H Tucker, timekeeper, and Mr. Ed. Hare as judge at the finish. After the races the crews, and a large representation of the club members with ladies and guests, left in the steamer to properly celebrate the club's seventeenth anniversary, and to inaugurate the new house at Riegatetten. SCULLS.

Miscellaneous.

DESCRIPTIVE GUIDE TO THE

ADIRONDACKS,

AND HAND BOOK OF TRAVEL

o Saratoga Springs, Schroon Lake, Lakes Luzerne, George, and Champlain, the Ausable Chasm, the Thousand Islands, Massena Springs, and Trenton Falls.

TESTIMONIALS.

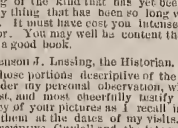
rom Hon. J. T. Headley, the Historian, Author of "Adirondack, or Life in the Woods," &c.

It is admirably written, and has just enough of humor, sentiment, and description of scenery mixed, to make it delightful. The illustrations are well chosen and very effective, while the instructions respecting routes, localities, distances, outfits, &c., embrace everything that can be desired. Taking it all in all, it is the most complete book of the kind has been published in the Adirondacks, and excepting even my own—a compliment that I trust will be properly appreciated for its extraordinary disinterestedness.

rom Albert B. Street, the Poet, and Author of "Woods and Waters," "The Indian Pass," &c.

I think it is the *best* work on the forest that has appeared—superior in word-painting to Murray's, and full of wood pictures and vivid scenes of camp-life. I realize that we are in the forest, are living with you in the scenes described, and that the trees are waving and the water flowing over and by us. This, I think, the true test of a good book, impressing its deity and distinctive life on the mind. As a "Guide ook," it is most creditable and valuable. Indeed, it the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for. It must have cost you intense application and labor. You may well be content that you ave produced a good book.

From Benson J. Lossing, the Historian.



I have read those portions descriptive of the places hich came under my personal observation, with the reatest interest, and most cheerfully testify to the eneral accuracy of your pictures as I recall impresions made of them at the dates of my visits. I recard your "Descriptive Guide" and the "Appendix" s a most useful—nay, well-spread table, unusual for tors to that wonderful Wilderness. A tour in that egion is eminently a practical matter, and for that eason I regard your "Guide" as an important, useful, nd timely publication.

Southern Railroad. N. B.—The Ashley House is within 100 yards of the fishing grounds. may11 3t

PIGEON STARTER.

OR MECHANICAL CAT.

Invented and patented by H. A. Rosenthal for trap shooting. Never fails to drive nonwilling birds to fly when the trap is sprung, and does away with the annoyance of throwing clubs and stones, and loss of time. Every gun club should have them. Price for single starter, by express, $25. Address Dr. H. A. ROSENTHAL, V. S., 5 Gates ave, Brooklyn, N. Y.

SUBSCRIBE FOR THE

SCIENTIFIC FARMER.

A 15-Page Quarto, issued monthly, and full of original reading matter. It is devoted especially to science, as applied to agriculture, and is the only journal in the world published with this avowed object.

It records all true progress in agriculture, and the latest results of scientific research. Chemistry, botany, veterinary practice, natural history, farm implements, rural art and architecture, rural law and entomology, are all prominently considered in its columns.

AMONG ITS CONTRIBUTORS ARE:

President W. S. Clark, of the Massachusetts Agricultural College, who has few equals as a writer on scientific matters.

Prof. O. A. Goessmann, who is acknowledged to be the first agricultural chemist of America.

E. Lewis Sturtevant, author of the "Ayrshire Cow," the "National Ayrshire Herd Book," &c.

A. S. Packard, Jr., editor of the "American Naturalist," and State Entomologist of Massachusetts.

Prof. N. Cressy, who is one of the foremost of our veterinarians, and is State Veterinary Surgeon of Connecticut.

Prof. Levi Stockbridge, whose experiments in cropping, by special fertilizers, have created astonishing public interest.

Jos. N. Strattevant, Esq., South Framingham.

Richard Gleanna, Esq., Lenox.

Prof. J. Wilkinson, Baltimore.

Prof. H. W. Parker, Massachusetts Agricultural college.

Prof. S. T. Maynard, Massachusetts Agricultural college.

J. N. Bigg, Member of State Board of Agriculture.

D. P. Penhallow, S. B., Amherst.

Fysshe and Fysshynge.

From the "Boke of St. Albans,"

BY DAME JULIANA BERNERS,

A. D. 1496.

QUOTED BY IZAAK WALTON IN HIS "ANGLER."

American Edition, with Preface and copious Glossary by GEO. W. VAN SICKLEN, Esq., of the New York Bar; heavy tinted paper; square 12mo., 120 pages, cloth; the absurd old illustrations reproduced.

The charming old book, with all its quaintness and freshness, is needed in the library of every angler, and of every gentleman of education. Get a copy and enjoy it.

Send P. O. order for price, $1.50, or order it C. O. D. from Forest and Stream. ap27 3m

Extra cloth gilt front and back, beveled boards, 442 pp., large 8vo., with numerous excellent maps, plates, and diagrams,

Curley's Nebraska,

By the

Special Commissioner of the London Field.

"A most excellent work."—*N. Y. Independent.*

"Executed with evident painstaking sagacity and ability."—*Philadelphia Press.*

"We have nothing to express but satisfaction with the book."—*London Spectator.*

"Consule 'Nebraska.'"—*London Nonconformist.*

"We can hardly conceive any information it does not contain."—*Land and Water.*

"Conscientious, painstaking, and impartial."—*London Field.*

The reviews are unanimously favorable, and they would fill a volume larger than "Curley's Nebraska."

FOR SALE, OR TO LET.

The elegant country residence, WILLOW LAKE, at Locust Valley, near Glen Cove, Long Island.

Suitable for Summer Boarding-House.

The house is 24 stories, frame, 40 feet front and 32 feet deep, with wide piazza front, rear, and on south end. On first floor are parlors, sitting-room, and dining-room; wide hall through the centre. Up stairs are 9 bed-rooms, all large and airy; kitchen well-arranged and conveniently; cellar large and dry.

On the premises, and at a convenient distance from the house, are a stable and carriage house, chicken-house, coal, coal, tool, and ice houses. The grounds are well laid out and tastefully planted with ornamental trees and shrubbery. The avenue leading from the road to the house skirts a beautiful lake, on the border of which the house stands. A Paper Mill at the north end of the lake will be sold with the above, subject to a lease. The lake and land embrace about 27 acres. As a place of residence it is elegant and healthy; for manufacturers it is convenient; for the propagation of trout, for pleasure or profit, there is no better place in the State. Apply to

Hotels and Resorts for Sportsmen.

THE "FISHING LINE."

Brook Trout and Grayling Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

The waters of the Grand Traverse Region and the Michigan North Woods are unsurpassed, if equalled, in the great abundance and variety of fish contained.

Brook Trout abound in the streams, and the famous **American Grayling** is found only in these waters.

Brook Trout Season opens May 1st.

Grayling Season opens June 1st.

Black Bass, Pike, Pickerel, and Muscalonge are also found in large numbers in the many lakes and lakelets of this territory. The spearing can readily send trophies of all skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st **Round Trip Excursion** Tickets sold to Points in **Grand Traverse Region**, and attractive train facilities offered to tourists and sportsmen; also on and after July 1st **Mackinaw and Lake Superior** Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, Send to Forest and Stream office, or address

J. H. PAGE, G. P. & T. A.,

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Negaunee and Marquette; with another line it passes through Madison, Portage, and on for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kanoshia, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, *via* the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GREESE, AND BRANT SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, W. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agt., Chicago.
apl6

TO SPORTSMEN:

THE PENNSYLVANIA R. R. COMP'Y

Respectfully invite attention to the

Superior Facilities

afforded by their lines for reaching most of the TROTTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars run over the smooth steel tracks enable PACK TO BE TRANSPORTED without failure or injury.

The lines of

The Pennsylvania Railroad Company

also reach the best localities for

GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVA, BRADFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting.

Also, to

TUCKERTON, BEECH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.

For Sportsmen.
A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.
A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.
Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

SPORTING, SHIPPING AND MINING
POWDER.
DUPONT'S GUNPOWDER MILLS
(ESTABLISHED IN 1801),
Have maintained their great reputation for 75 years. Manufacture the Celebrated
EAGLE DUCKING, EAGLE RIFLE, AND DIAMOND GRAIN POWDER.
The most Popular Powder in Use. Also,
Sporting, Mining, Shipping and Blasting Powder
Of all kinds and descriptions.
For sale in all parts of the country. Represented by
F. L. Kneeland,
Feb 10-1y **70 Wall Street, New York.**

The Hazard Powder Co.,
MANUFACTURERS OF
Gunpowder.
Hazard's "Electric" Powder.
Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

Hazard's "American Sporting."
Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close, and with *great penetration.* For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."
FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½, and 6½ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.

SUPERIOR MINING AND BLASTING POWDER.
GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.
88 Wall Street, New York.

Bound Volumes
OF
Forest and Stream.
FIFTH VOLUME NOW READY.
Price, $4.00.

A complete set of the FOREST AND STREAM, five volumes, bound handsomely in cloth—a valuable library for the sportsman—can now be obtained on application to this office.

Orange Sporting Powder.
ORANGE LIGHTNING POWDER,
The *strongest* and *cleanest* Powder made. Nos. 1 to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.
ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6½ lbs. each, and in canisters of 1 and 5 lbs.
ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g. FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6½ lbs., and in canisters of 1 lb. and ½ lb.
All of the above give high velocities and less resinum than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.
LAFLIN & RAND POWDER Co.,
26 Murray St., N. Y.
Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.
The undersigned is prepared to prove all the superior qualities he claims for his powder.
Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.
He challenges all riflemen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 200 rounds equally divided at the three ranges; sighting shots extra.
Will shoot for money if desired.
The powder is also well adapted for shot guns.

McBride Flies,

The Standard Flies for American Waters.

These flies are imitations of American insects, or combination of colors, that an experience of forty years has proved most success ul Parties supplied with casting lines and artificial flies for Pennsylvania trout streams, Adirondacks, the Maine Woods, Lake Superior, Thousand Islands, Canadian, and other waters. Anglers not acquainted with the nomenclature of these flies, by mentioning the locality where they intend fishing, will have the varieties best suited to those waters sent to them. Flies copied from any natural insect or pattern desired. SARA J. McBRIDE, (Successor to John McBride) Mumford, Monroe county, N. Y.

W. H. HOLABIRD

Would most respectfully announce to his patrons and friends that he is prepared to make

Shooting and Fishing Suits

at the above prices. The ten dollar suit is better made than any competitor can offer for the same money. My original design having been appropriated by other manufacturers, I have been compelled to make many changes in the arrangement of pockets, &c., for which I have to thank the fraternity at large for suggestions. I believe that I have the

BEST SHOOTING AND FISHING COATS IN THE WORLD,

and respectfully solicit your orders. I send my new Illustrated Catalogue, 16 pages, free on application.

Dealers will find it to their advantage to handle my goods. They are better known and more highly esteemed than any other make.

THE NEW

BOSTON SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

Paper and Metallic Shells

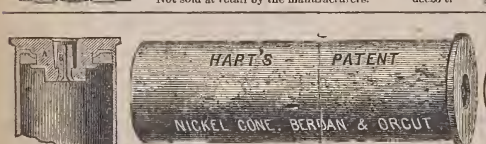
FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.



THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents missfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2½ to 3¼ inches.

Shells and Loaders, and description Price List, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen:—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,

A. H. BOGARDUS.

THE GREAT

London Gun Trial,

1875.

W. W. GREENER'S

Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz; $75, gold; extra for extreme close shooting, $10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & C. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

Send 25 cents for large Illustrated Catalogue of Guns, and including Game Laws for all the States, and summary of Great London Gun Trial. Ready March 1st. jan18 1y

Clark & Sneider.

214 W. Pratt st., Baltimore.

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.

FOREST AND STREAM

Terms, Five Dollars a Year. Ten Cents a Copy.

NEW YORK, THURSDAY, MAY 25, 1876.

Volume 6, Number 16. 17 Chatham St. (City Hall Sqr.)

For Forest and Stream.

The St. Marys River.

NEED I tell the readers of FOREST AND STREAM, that the St. Marys is a wonderful river? I don't think there is need of that. It is *not* a wonderful river. It is an interesting one, though, and possesses attractions that should bring its name into more frequent mention. Rising in the great Okeefenoko Swamp of Georgia, it pursues a very crooked course for—I don't know how many miles—dipping away south, then east; north again, still again easterly, until at last, it loses itself in the Atlantic, between the islands of Amelia and Cumberland. It forms the dividing line, the length of its course, between Georgia and Florida.

Coursing over the Fernandina bar, you look straight into its mouth. Fernandina, with its magnificent harbor, stretches away south. Cumberland Island, famous in history, lies to the north. The ruins of "Dungeness," once the property of Gen. Nathaniel Greene, gleam white above its forest of oaks. Fort Clinch, on the Fernandina shore, frowns upon you with its big guns and deserted walls. The little town of St. Marys is the first, and only town of any size on the river. It lies low on the river, on a lovely peninsula stretching back to the pine woods of the main land. Forlorn and dilapidated as the little town now appears, it once was the seat of wealth and refinement. The people, now, are among the best, but prosperity departed with the coming of the war. It has exalted hopes, however, and its residents prophesy a future even more prosperous than ever before enjoyed. For healthfulness and delightful retirement, this place cannot be surpassed. The marshes that open out towards Fernandina, and above and below, on the river, swarm with rail, and, in their season, with ducks. The distance from Fernandina is twelve miles. There is a good hotel here, the table of which will compare favorably with that of any in Georgia. It is a quiet resort, and retains its visitors longer than the generality of winter hotels. The cemetery and the "Washington Oak" are much visited.

It is about a month since, that a party of us left Fernandina for a trial trip up the St. Marys. When I say *trial* trip, I mean that we were going to make a trial of several things at once. First, it was the trial trip of the good steamer *Cumberland*, which was going to try to carry us as far as navigation would permit. We were, I fancy, somewhat trying to the Captain of the Cumberland, who was continually trying to make us happy. Then, again, there were vague hints thrown out that Mr. D. had a few bottles of choice, also on a trial trip. Withal, it was a trying occasion. We started out, then, in charge of the Captain—who is a right royal fellow, if his name is Smith—left Fernandina and St. Marys behind, and struck into the marshes that line the river for miles above. Long, high bluffs occasionally advance upon the river, crowned with oaks and pines and composed of good soil. Five miles above the town of St. Marys is Port Henry, said port being made of a saw mill, an old plantation and several cabins. The oaks overhanging the stream, the bluffs behind gleam yellow, and St. Marys, dim across the marshes, shows a puff of smoke from its mills, and the outlined masts of its schooners against the sky. Upon closer examination, the old plantation reveals attractions to such as are agriculturally inclined, and he who loves a broad stretch of level field, dotted with large oaks and bordered by green pines, would find this place not so very bad. A few miles above Port Henry we reach the "big bend," where, in a distance of five miles, we find ourselves at the end, less than a quarter of a mile on our journey. At the end of this big bend, we look across the marshes and can see St. Marys against the eastern sky. A sea of marsh is between us, a few pine islands growing out of it, and pine woods limiting it. It is said to be twenty miles from this point to St. Marys, by the river, and not more than seven miles straight. A narrow cut-off affords passage for small boats, thus avoiding this long bend of five miles. Now the character of the banks changes and trees fringe the banks and sweep the water. The river is straighter and broader, though nowhere more than a gunshot across. Calm and peaceful, it gleams bright 'neath the sun. The Little St. Marys joins this river from the south, a few miles above the marshes, and just above here is deserted "White Oak Plantation," once a famous rice plantation, now gone to ruin. Its miles of canals and ditches are still emptying their waters into the river, and wild rice still grows over the meadows, but all now is desolate. If I am not mistaken, however, there is grand shooting here, over those old rice fields, and in the months of January and December, mallard and other ducks are said to swarm here. Let the sportsman remember this next fall and pay it a visit.

The scenery is very beautiful. The banks are now higher than along the St. Johns, and, where it is swampy, the oaks, maples, cypress, and ash, hung with moss, enchant one with their loveliness. Pink and white azaleas, crimson red buds and yellow jessamine, gloam and glow among the trees, their beauty enhanced by masses of maiden cane, and reflected in the glassy water. Of course, the Spanish moss is everywhere and lends added beauty to all it embraces. Then we go on, between these banks of green, getting all the enjoyment possible from the trip.

We find the Cumberland very convenient. She is just the boat for a large party: roomy, plenty of berths, a good cabin, and a high deck for observation. She is capable of making good time, too. As to the Captain, he is a worthy representative of the Cape Fear River captains of North Carolina. Genial, prompt, exercising a careful watch over the welfare of his passengers; we had not been aboard many hours before we discovered that he was a good fellow in every sense. He is a good sportsman, too, and will do anything in reason to accommodate those desiring to hunt and fish. The crack of his old double barrel was frequently heard on the trip.

The most picturesque bluff on the river rejoiced in the unpoetical name of "Brick-yard Landing." Overlooking the fact of its beauty as a place of residence, some of our party called attention to the wealth of clay stored in the high banks, and the facility with which said clay could find a market in the shape of bricks. It is said to be the only one on the coast, or tributary to it, and that a great sale could be expected, could this property be rightly worked. Many of the bricks composing the walls of Fort Clinch came from this place, and the old kilns bear testimony to having been planned by skilled hands. This is one of the many enterprises of the South lying dormant for want of capital. The clay is said to be of first quality, and the soil around and running far back into the piney woods, excellent. A fine spring bubbles up from the bank, shaded by grand old oaks. All along the banks are high; every few miles, a settlers' cabin, a cleared slope in front, and fenced fields on either hand. At Woodstock, we suddenly burst upon an unexpected sight. Nine lumber vessels, mostly three-masted schooners, lie moored to the wharves. This place is fifty miles from the ocean, and to see the tall masts of these sea-going vessels looming above the pines of a river not a hundred yards in width, seemed strange, indeed. There are two mills here, belonging to the St. Mary's River Lumber Company, and in charge of Mr. Whiting, a gentleman of great business tact and ability. The residences of the Superintendent and employees formed quite a village.

Two miles further on is King's Ferry, an old settlement, where the proposed line of the Great Southern Railroad crosses. There is a telegraph station here in charge of an able and courteous officer. The line of road is graded to Callahan, on the Florida road. A ferry is established here, in charge of Mr. Parker, who lives in a little cottage near, almost hidden by orange and fig trees. There are three stores here, for it is a great trading-place for the country people, who come in every Saturday to trade. Some turpentine stills in the interior, also make this the point of shipment of rosin and turpentine, by schooner, to New York.

The day having been spent by much extra work on the steamer's part, we tied up to King's Ferry at dark, and prepared for a pleasant evening on board. We were here joined by one M. who had been in the country looking after his turpentine business, and his advent was hailed by all who knew him with demonstrations of welcome. He had the reputation of being a great story-teller, and after sundry and frequent urgings, he consented to favor us with some specimens of his skill. Want of space forbids my chronicling even one of his good stories, but they were kept up far into the night, and put us all into the most peaceful of slumbers.

We passed Orange Bluff, three miles above King's Ferry, early next morning. Here, on the northernmost point of land in Florida, were several beautiful orange trees, thrifty and in bearing, apparently from fifteen to twenty years old. They had never been injured by frosts, and practically refuted the oft told story that the orange cannot be grown successfully north of the St. Johns. Here we saw, too, a tribute to the sweetness and purity of the water of St. Marys. At the end of a wharf, a well-curb contained a bucket for drawing from the river the family's daily supply. It is really the best of water, and though the influence of the tide backs the current above here twenty miles, it is never brackish, except in the dryest of dry seasons.

Chalk Bluff, above Orange Bluff, is a nice slope from the pine woods to the river. All along, at intervals, are long parks of open pines, and on a slope in the distance may be seen the settler's cabin, surrounded by feeding cattle. Colerane, on the Georgia side of the river, is opposite the extreme northern shore of Florida. It is noted for nothing, I believe, except that the bluff is high and the one saw mill here seems in successful operation. Here, also, we saw a schooner loading, with barely width of river enough for us to pass her.

Camp Pinckney, about seventy miles from the mouth of the river is not so large a place, probably as it was nearly a century ago, for there are but two houses visible, and an old turpentine still, while there is a ferry here, established in 1778, by Gen. Howe, when the famous "King's Road" was opened—the same King's road that led to old St. Augustine.

The end of our trip was at Calico Hill, where we turned about, after an inspection of the place, and descended the river. At this place is the highest land on the river, crowned with oak, hickory, and pine. The peach trees were in bloom and wild flowers and trees adorned the banks with bright colors. A spring bursts from the side of a winding road, the water of which is impregnated with iron. Here we left one of our party, who intended making this his home. Since, I have heard that he has made great improvement in the appearance of the place; established a ferry, built a road and planted out many trees.

Our homeward trip of eighty miles, was without incident. There were many things that were enjoyable at the time, and would afford pleasure in the telling, that want of time forbids me to relate. There was one incident, however, that I must not let slip into oblivion. Our worthy watchman, who was a good fellow, and withal, a mighty cat-fisherman, usually wiled away the weary hours in fishing. That night, he fished without success, and getting weary, drew in the pole and line and threw it on the lower deck. It chanced that a huge cat, of the Thomas persuasion, it is presumed, strolled aboard and spied the bait on our watchman's hook.

He had been fishing for cats—and a "cat's" a cat, on sea or land. So, probably, reasoned our feline friend, who swallowed the bait and hook, and immediately commenced a series of jumps and howls that started our watchman from his drowse. As he commenced to haul in the line, the cat made for him, whereupon he retreated, shouting for help. The cat's eye shone like fire, and he cleared six feet at every leap, so it is averred that the watchman was the "worst scared man on the St. Marys that night, sure." Finally the cat was hauled in and the line cut, when he departed with about five feet of line, the lead and hook, of a good cat-fish line. This happened at Coleraine.

As we were not hunting, I cannot speak from experience of the game resources. From conversation with the resi-

dents, I gather that there is good turkey shooting around Calico Hill, and some deer shooting. Black bass and shad are now plentiful, the latter being caught every night in fine condition. They run here till the last of April.

We had good alligator shooting, seeing several, and on one trip since, they counted thirty on the banks. As the season advances they will afford excellent sport. Turkeys are found at intervals along the river, but deer are scarce, except back in the woods. The river has never been hunted or has the St. Johns, and I believe a party could have glorious sport, starting in December. By taking the Cumberland to Calico Hill, and then rowing about ten miles further, to Traelore Hill, they would be within a few miles of Okeefenokee Swamp, where deer, bear, and turkeys, are said to live in large numbers. It would be an enjoyable and novel undertaking; one easily done and likely to prove remunerative. By taking the direct steamship line to Fernaudina, from New York, they make straight communication with the Cumberland, and can do the whole thing at far less expense than an ordinary trip up the St. Johns from Jacksonville and back.

Permit me to add, in a postcript, that I think an injustice has been done the Fernandina line from New York here, and its agent, Mr. Woodward. In a letter in a recent issue of FOREST AND STREAM, he is called hard names, and the travelling public advised to seek some other way of entering Florida. It is easy to get aggrieved at a ticket agent, and, four years ago, I would have advised everybody coming this way to avoid the Atlantic and Gulf Railroad from Savannah, because they, as I thought, swindled me, at that time. I came here in the Fernandina line last fall, and came easier, quicker, cheaper, and brought more freight at less expense than at any time before. I do not speak from a single season's experience, for I have traveled the route north by all the routes afforded—by rail, *via*. Savannah; *via*. Charlestou, and direct by sailing vessel, and can honestly say, without hope of reward, that the Fernandina line now affords the cheapest, easiest, and most direct route to Florida. I have always found Mr. Woodward courteous and gentlemanly, and shall think that, when he is accused of being "thick-headed," the fault does not lie entirely with him. FRED BEVERLY.

Fernandina, March, 1876.

[Editorially, we have recommended the Fernandina line to those seeking Florida by direct route, especially if they have many chattels to take.—ED].

For Forest and Stream.

A NARRATIVE OF THE UPPER MISSISSIPPI.

DURING the summer and autumn of 1874 the writer was engaged with a party of engineers in making a survey of the headwaters of the Mississippi River. The mighty "Miche Sepe," or "Father of Waters," after leaving the maternal bosom of Lake Itasca winds its way through almost impenetrable cedar swamps, rice beds, and majestic pine forests. Now and then spreading out into lakes of no inconsiderable extent. The country abounds principally in Chippewa Indians, deer, moose, bear, and during the milder portion of the year in large flocks of ducks, geese, and other migratory fowl. The Chippewas are not indigenous to the soil, but were transplanted thither some years ago by the Government from a reservation further south, possibly on account of the healthfulness of the climate, more probably on account of the worthlessness of the country for agricultural purposes, and the Indian, for purposes of civilization. These Indians live a contented and happy life; they build their huts generally of birch bark, subsist mainly by fishing and hunting, and when they die go to the happy hunting grounds with as much ease and elegance as though they were asked into it with all the pomp and paupoy of a modern masonic funeral.

Of all the numerous lakes through which the Mississippi winds its labarinthin course, Lake Winnebagoish has the reputation of being the most dangerous. According to an old Indian tradition, the country around this lake was once used as a hunting ground by both the Sioux and Chippewas, between whom an eternal enmity existed. Two hunting parties, one from each of these tribes, while persuing their Nimrodiam propensities, happened to meet on the borders of this lake; a great battle thereupon ensued in which the Sioux were totally defeated and a great number of them killed. After the battle their bodies were thrown into the lake. It is to these departed spirits that the Chippewas ascribe the contiuual turmoil of these waters. But to a more enlightened mind the roughness of the lake would appear to be attributable more to the nature of the lake itself than to any superhuman power these departed red skins may exert. In shape this lake is almost circular, in diameter about forty miles; being totally devoid of islands, the wind has full sweep, no matter from what direction it may come. It was during our return trip and while we were encamped on the borders of this lake, that the incident which I am about to narrate occurred.

In moving our camp from one side of the lake to the other it was thought best not to load the canoes to their full capacity on account of the roughness of the water, but to leave some of our luggage and send back for it. Oliver and Clarke, two men belonging to the party, were accordingly left with the remaining effects, while we set out for the other side with the rest. Just before starting I heard them say that they were going hunting and wanted some metallic cartridges for their revolvers. They little thought that they would have to use them in another cause. By keeping close to lee shore in order to be protected from the wind we managed to make the trip without much trouble. After landing and unloading the canoes, two Indians, acting in the capacity of boatmen, were dispatched to the other side for the two men and the remaining luggage. The wind by this time was blowing a gale. We stood upon the beach watching the Indians until they had rounded a small promontory. Turning to our accustomed duties the day passed on without anything occuring to break the monotony of camp life, until about an hour before sunset, when our attention was called to a boat containing four men about five miles out. The lake had now become a perfect cauldron, the waves running higher than we had ever seen them before, with a cross sea. We knew that the chances were a hundred to one that the men would never reach shore alive. There we stood an awe struck crowd, momentarily expecting to see the boat capsize and sink. But on she came rearing and plunging, driving right before the wind until she approached within two miles of the shore. Suddenly she disappeared from view; not a vestige of her was to be seen. For several moments not a word was spoken, not a sound was heard, save the rushing of the wind through the pine tree tops and the roar of the waves as they lashed themselves into foam against the rocky beach. Then suddenly we saw through the gathering gloom the flash, and a moment after heard the report of a pistol. What could this mean? Was it a call for help? With anxious and inquiring faces, we appealed to each other to suggest some means by which we could succor them. Time and again we tried to launch a boat, but each time it was hurled back by the relentless fury of the waves. With sad and downcast faces, we turned aside, each one no doubt thanking God that such had not been his fate. About an hour after a faint cry was heard coming from the direction of the lake. Was it possible for a man to live through such a war of the elements as we had just witnessed? We thought not. But hark! there it is again! Could it be a man, or was it some animal attracted by the light of our camp fire? Seizing a pine torch we ran to the beach and there lying half on the land and half in the water we saw Oliver more dead than alive. After wrapping him in a blanket and administering a reasonable amount of stimulants he recovered sufficiently to give us an account of the affair. In trying to lighten the canoe by throwing out some of the luggage, she upset. Clarke and one of the Indians swam for the shore, while Oliver and the other retained their hold of the canoe, which, although half full of water was still floating. It soon became evident that the canoe in its present condition would not support them both. The thought seemed to strike them simultaneously: they must either fight for the canoe or swim for shore. To swim ashore seemed impossible; to fight for the canoe was their only alternative. The gaining of a moment's time might decide which was to live and which to die. They were within arm's length of each other. With the rapidity of thought the Indian drew his hunting knife and with a lunge sent it hilt deep into his antagonist's shoulder; the next moment a ball from Oliver's revolver went crashing through his brain. Oliver clung to the canoe with his uninjured arm, and so saved himself. The following day we were very much surprised by the appearance of Clarke and the other Indian in camp, as we had given them up for lost.

Our stay on Lake Winnebagoish after this was very short, but long enough for us to become thoroughly imbued with the Indian superstition that the lake was possessed of the devil. E. U., JR.

Louisville, Ky., March 25th, 1876.

For Forest and Stream.

SNAPPER FISHING IN FLORIDA.

I THINK that some readers of FOREST AND STREAM would like to know how we fish in Florida for snappers. These are fish in no way related to the snapping turtle of "soupy celebrity," but they exceed him greatly both in weight and flavor. Personally he is a large, chunky-built fish of bright red color, weighing from twenty to sixty pounds. His home is on a reef extending parallel with the coast, about twenty-two miles directly out to sea from the mouth of the St. Johns. He bites greedily; when hooked, fights nobly; and last, but not least, "eats" splendidly. The steamer Mabey was to leave Jacksonville at 2 A. M. in the morning, so about half an hour before that time I wended my way through the deserted streets, armed with a rope, which by courtesy they called a snapper line, and a hook about six inches long. Most of the excursionists were present, and the remainder were speedily collected, and so with about fifty impatient fishermen the Mabey steamed rapidly down the St. Johns, and about daylight we arrived at Mayport, which is right near the bar. It consists of some twenty houses built upon the pure white sand, with not a trace of vegetation. It is a great summer resort for the people of Jacksonville, who go there for the sea breeze and fishing. Having obtained our bait, we left this place and crossed the river, where a very pretty collection of cottages marks the site of Pilot Town, so named from being the home of the pilots of the St. Johns bar. Having obtained our pilot, we stood directly out to sea. Boys, have you ever been to sea? If you have, you know what it is to be sea sick; if you haven't, I will leave experience to be your teacher. Your humble servant had not even seen the briny deep till this memorable day, and we had no sooner crossed the bar than he was leaning over the side, employed in showing to the fish his beautiful set of teeth; nor was he alone in his misery. The cabin floor was soon strewn with the groaning forms of sixteen more unfortunates, including the favorite Newfoundland dog of one of the gents that had never been to sea. We hoped that our groans would descend and appease the god of the sea, but alas! we only grew worse. Could the man that wrote "A Life on the Ocean Wave" ever have been sea sick? We got no sympathy from those who had their sea legs, on the contrary, as some poor fellow would make more noise than usual they would ask him if he was trying to say New York, or kindly proffer him a piece of salt pork. It was in this state, lying flat on my back, with little thought or care for anything, that we arrived at the banks. After throwing out a buoy to mark the place, the fishermen baited their hooks and cast them out, and it was at this stage of the proceeding that I, who had not stirred from the cabin, heard a frantic yell of snapper! snapper! accompanied by a scampering on deck as if bedlam was broken loose. The noise continued, the yells grew more frequent, and were of a different character, for mingled with the cries of snapper, I now heard blackfish! sharks! My sporting instinct was aroused, and in spite of myself I staggered to my feet, and grasping my line, frantically I gained the deck. Such a sight! The deck was strewn with blackfish, and five or six large snappers, while over the side leaned five and thirty excited men, some pulling in, some throwing out, and all yelling like madmen. I forgot that I was sick. It was a triumph of mind over matter; baiting my hook, I quickly lowered my line. It hardly touched the bottom before I felt a pull that nearly pulled me over. I responded with right good will, and oh! ye ghost of Isaac Walton, was it a fish? I had never in my limited experience had anything hooked to a line to compare to it. I pulled, he pulled; sometimes he gained, and then with a mighty effort I would bring him in. The deck resounded with encouraging shouts. Finally he appeared in sight, four or five fathoms deep in the clear blue water, like a ghost being drawn out of the depths of the sea. I soon had him to the surface, and grasping my line I had him aboard. What a beauty! Talk about sport. I never have experienced such a feeling of triumph, as when out of sight of land I landed that snapper. Congratulations poured in, for he was the largest caught that day, and weighed full forty pounds. I returned to the sport, and though I hooked another snapper, I did not land him, but I caught a noble string of blackfish, sometimes two at a time. We only could stay on the bank forty-five minutes, for we had to get back in order to cross the bar at high tide. But in that time were caught 20 snappers, weighing in the aggregate 600 pounds, and over 250 blackfish, which weighed from ¾ to 1¼ lbs. each. If we had struck the reef a little sooner we could have stayed two hours, and I assure the reader that two hours of such fishing is as much as he will want. We strung all our fish forward, and forgetting our sickness sat down to a chowder of snapper such as might make an epicure's eyes water. We arrived at Jacksonville with bell ringing, whistle blowing, and all our flags flying, and were greeted by a large and enthusiastic crowd. As I had about two miles to walk I could not think of carrying my snappers and blackfish; I sold the former easily for $1.50 and also $1 worth of blackfish, and had as many as I could "tote" home; so you see, in a pecuniary point of view, I was better off than when I started. My friend assures me that one time on the snapper banks he caught by himself 16 snappers, paying his fare and clearing some $4.

The main thing about Florida fishing is that it can be pursued without fatigue to the delicate, while to hunt large game is very exhausting, as tramping through palmetto up to your chin, or mud up to your waist, is anything but pleasant. But as for small game, it is very plenty. Quail, snipe, and many other graniferous birds are plenty, as well as squirrels, and to the delicate seeking an asylum from the rigors of a northern winter, Florida will always remain pre-eminent. G. W.

For Forest and Stream.

A DAY'S GEESE SHOOTING AT CURRITUCK.

"COME along, we must be off at once, or we shall be late on our ground—hurry up." I was standing on one of the large open boats commonly used along the North Carolina coasts, and addressing myself to a companion who still lingered on the beach, about one hundred yards away. A large coop, placed in the centre of the boat, covered with slats, between which the heads and necks of numerous tame wild geese (if such a hibernianism can be permitted) were protruding, indicated the kind of game we were about to go in quest of. Near the boat lay another of about equal size, just ready to shoot after wild duck with its compliment of three sportsmen and boatmen. A quantity of decoys were stowed away with the traps upon the floor, among which showed conspicuously a large number of wooden canvas back effigies, showing that the royal bird was the main object of pursuit. The time was about four o'clock, of a November morning, and no light had yet begun to steal along the eastern horizon indicating the coming day, but both land and water were still shrouded in darkness, while the sky was hidden by thick clouds that were driven rapidly along by a rather strong wind, and an occasional slight fall of rain promised anything but a pleasant day. "I don't think I'll go," at length was answered from the beach, "it is going to rain, and I think it will storm before you get back I guess I'll stay on shore this time." "All right," I replied, "but I mean to have some company." Then, hailing the occupants of the other boat, which was just leaving, as its sail filled to the wind, I called out, "Boat ahoy! one of you come with me. George drop aboard here with your traps, there will be enough left to kill ducks." "All right," replied that individual. The boat was thrown into the wind, and soon we were on our way down the sound to one of the low islands that dotted the surface of this great inland bay, and which was pretty certain with the wind that then prevailed to be a good point for geese. As we proceeded, the splash of the waves against the bows, startled many a flock of duck, which rose unperceived in the darkness, their whistling wings alone indicating their line of flight, while heavy strokes upon the water, and the loud bugle notes, told of some frightened swan trying to rise from out the troubled water.

Shortly after leaving the anchorage, the two boats parted company, their occupants expressing mutual wishes for good sport, and not long afterwards we arrived at our desired point. The island was low and shady, far out in the middle of the sound, a line of cane growing in the centre. It was evidently a place much frequented by sportsmen, for blinds were in position, upon the proper places to shoot from, and cartridge cases lying about upon the sand and floating on the water along the shore showed that the stands had been occupied not many days before. While we were getting our guns and traps into the blind we intended to shoot from, the boatman was placing the live decoys in position, one most favorable to catch the eye of any of their wild brethren passing by. Each goose was fastened to a stake by a leathern strap two or three feet long, riveted around the leg. The stake was pushed firmly down into the sand so the platform which was placed upon one of the ends, was only a few inches below the surface. This platform was intented for the bird to stand upon and dress its feathers when tired of swimming about. The live decoys were placed in two lines growing wider apart as they advanced from the shore, and thus presenting a broad front to any birds passing up and down the sound. The geese having been put into position, and the boat anchored behind the island out of sight, we betook ourselves to one stand, while the boatmen went into the other. As the preparations were completed, the day began to break, and the voices of the numberless fowl, together with the whistling of wings and splashing in the water indicated that the birds were beginning to look for some quiet place to pass the day after their night's feeding. The decoy geese, since their release from the coop, had been busy washing and cleaning their feathers, but now one or two honks from the outermost birds, quickly repeated by the others, followed by flapping of their wings, told the watching gunners that the sharp-eyed birds had discovered some of their kindred coming over the water. Soon, against the horizon, three geese were seen flying low down, and heading directly for the island, and in a moment after their answering honk was heard as they sighted their captive fellows, who were doing their best to lure them to destruction. I might point a moral just here, but I never could stop to moralize much when geese were coming head on to decoys. As the birds drew nearer the decoys ceased their calling and merely expressed their satisfaction by looking sideways at their

unsuspecting relatives, and perhaps flapping a wing or two just to prove they were as live geese as they pretended to be. Setting their wings and making a half circle so as to bring themselves head to wind the three birds, with a beautiful and graceful evolution, settled upon the water, and immediately sailed up to the decoys and commenced to fight with them. Exchanging glances we rose to our feet and presented our guns over the blind. At the same moment the wild birds took wing and were rapidly widening their distance from the shore, when two reports were heard and two birds fell headlong, and before the survivor had had time to miss his companions another barrel was discharged and he lay lifeless upon the water. The decoys, which had remained perfectly quiet from the time the geese had settled in their midst, now expressed their satisfaction at the result of their deceptive allurements by much bowing to each other, and throwing water over their backs. The action of the sportsman was slightly different, but expressed equal satisfaction in their way. It was somewhat in this wise: "George, my fledgling, how do you feel?" "Prime Zoopilus, my cherub, prime!" Then he smiled a suggestive smile, took something out of his pocket; and being a classical scholar, ejaculated with great solemnity, *Bibimus*, and they bibited! The birds were retrieved by a black Newfoundland, who, I omitted to say, was among the company, and not by any means the least of them, either; and new cartridges having been inserted in the guns, all things were ready for a repetition of the scene just described. The sun had now risen, and with it came an increase of wind, and soon so hard it blew that the ducks as they come on before it would swing in towards the decoys, but found it impossible to stop. Some more flocks of geese had visited the stand, and the bag was getting heavy, for quite a number of birds had fallen to the guns, when a great honking from the captive geese indicated something unusual. The cause was soon perceived, as a flock of about fifteen or twenty birds gradually approached the island. The gunners were crouched down in the blind, and even the dog had his head on the ground. Taking the same course as all the previous birds, these flew just below the island, then setting their wings, came sailing in a solid column up to the decoys and settled. The two friends were about to rise, when an almost imperceptible movement cautioning them to be still from the boatmen, showed that something had attracted his attention, and on peering thro gh the blinds, another flock was seen approaching of about the same number as that which had just alighted. Of course all kept still in their respective positions, merely watching the birds, as taking exactly the same course as the others, they swung round and gracefully joined the first arrivals. Preparations were being made to give them a warm reception, when simultaneous honking from the assembled birds indicated the approach of another flock, which, following the line of their predecessors, joined the gathering crowd in front of the stand. It was getting almost too hot, this corner, although it was a winter day, and I had just made up my mind to lay low about two dozen of the birds in front of me, when George whispered, "keep still, here comes some swans; don't shoot, we may have a chance at them." I succumbed, for the rapid arrival of the flock before me was so unusual and surprising that if he had told me old Noah with his ark was in view coming to settle down to our decoy, I should not have been astonished. I would only have got ready to get a raking shot at the whole lot. The swans were swimming towards us about three hundred yards distant, and by the rapidity with which they were advancing promised soon to arrive within gun shot. As we watched them renewed honkings heralded the arrival of another flock of geese, which was followed by another and then another, until I began to think all the geese on the Atlantic coast had made an arrangement to meet at our stand that morning. I peeped through the blind and witnessed a sight that would have made any sportsman's heart glad. There were over one hundred geese within sixty yards of our post, swimming about, priming their feathers, or taking occasional knocks at our decoys. The swan had come on until their feet had touched bottom, when they stopped advancing, too far away, however, for a shot. "Respected ancient," I gasped, to my companion, "there is an electric current coursing up and down my back-bone, and this lightning rod in my hand cannot be controlled much. If it should touch my spine it would certainly go off. I think by way of precaution I will take aim." The two guns were pushed through the blind, but the geese had begun to get uneasy and were swimming away. It was difficult to get many in line for each gun, and after waiting a few moments it was decided to fire one barrel sitting and the other as the birds rose. "Are you ready?" a groan intimating assent, and the shot went hustling into the feathered crowd. What a row was there! jostling each other in their anxiety to escape, it was with difficulty the frightened birds found space to spread their wings so closely were they massed together, and as they left the surface of the water the two remaining barrels were discharged into the retreating ranks, carrying death in their course, and adding to the terror which already possessed those that were fortunate enough to escape unharmed. What a relief it was to stand upright and be able to look about without the fear that a flock of geese would come sailing in and light on our hats; for the report of the guns had startled everything from our neighborhood. The swan could be seen in a long white line, disappearing with labored flight in the distance, while immediately in front the dog was busy bringing out the results of our shots. Happening to cast a look at George, he seemed to be in difficulty with his pocket, as he was tugging at it or something in it very earnestly, but saying nothing, never a word. It time he drew forth that same strange looking instrument I have above refered to, and opening it, handed it to me with a sigh that I was to invert it and look into it. I did so, and returned it to him feeling much better. Probably to ascertain if it would have a like agreeable effect upon his long suppressed feelings he imitated my action, and from the great sigh of relief he gave afterwards I knew he was comforted.

The wind had been growing less strong, and soon after our last shot it fell to a calm, so that we had no more shooting until late in the afternoon. As we started homeward our boat appeared as if loaded for the market, as her hold was filled with birds, and as we drew near our anchorage we were hailed from the beach by our friend who staid behind. "What luck?" "Come out and see." Jumping into a small boat he was soon alongside, and as his eye fell upon the hill of geese before him his face was a study as the various expressions of astonishment, disappointment, and pleasure appeared in succession. "Just my luck," he exclaimed, "I never can hit it—you wouldn't have got a goose if I had been along, so it's all right. How many are there in that mountain?" The number was not so very great after all, for a few geese make quite a show; however about forty large birds were the result of the day's sport, enough to kill in one day, for we estimated our enjoyment not so much in the number of birds slain as in the pleasure we received in watching them approach the decoys, and then their graceful movements as they gradually settled upon the water.

I have had many day's sport of geese shooting, both before and since the one recorded now, but never have I seen such a mass of birds gathered to decoys at one time as on that memorable day in Currituck Sound.

ZOOPHILUS.

LO! FOR A DUCK, BEHOLD A DUCKING.

SAVANNAH, Ga., April 29th, 1876.

EDITOR FOREST AND STREAM:—

Some time ago, two of my friends, whom I will call N. and A., while strolling along one of the old rice dams on Hutchinson's Island, opposite this city, seeing quite a number of summer duck flying overhead; watching them until they settled down in one of the numerous ponds, decided that such things ought not to be allowed to pass by unmolested, and then and there made up their minds that the next afternoon should see them ready to pay their respects to the many members of that most beautiful of the duck species, which they believed to be hid away among the tall grass and weeds. Ever and anon springing up and flying off to some apparently more favored spot. The next afternoon saw them on their way up the river in a small boat for the selected place, and here beginneth their chapter of mishaps. Making a mistake, they rowed past the creek they should have taken—they had till then had the tide with them and all was plain sailing—but now to poll back against a heavy spring tide was another thing altogether. As they slowly made their way back they were hailed from a raft by a "man not brother," who wanted some matches. "Yes we will give you some if you will take hold of the painter and pull our boat along the rafts out of this stiff current and past the eddy." This he did at once, for he said he had not been able to get any dinner for want of some matches to light a fire.

Our sportsmen being somewhat rested, laid to their oars like good fellows and soon were at the shooting grounds. The ducks had already begun to fly, though in small numbers. N. was not long in waiting, when one passing him at about thirty yards, was hard hit by a charge from his trusty Parker, but falling far out in the pond, he thought it useless to try to get it as his dog had not seen it fall. Another load, full report, and he has the mortification to see a lot of feathers floating in the air while the duck is still heading for South Carolina. In the meantime A., who has been an interested looker on from his hiding place in the tall grass, thinks he ought to have a hand in the game, and suddenly rising to his feet with a neat double shot, drops a couple at about 30 and 35 yards, with what N. was pleased to call squib loads, of two drachms of powder and an ounce of No. 8 shot. But the little gun is a close hand at flooting one, and one on which there is no discount. Alas! one of them had fallen into a ditch through which the water was running like a mill tail, and was out of sight in a moment. The other, only badly wounded, could not be found by the dogs, and must have dove as it struck the water and clung to the under growth to perish—to become food for the coons.

Disappointed and discouraged, our sportsmen give it up and start back towards the boat, N. taking the lead. The tide having come up very high, it had washed the bank, and splash, in went N. up to his middle in mud and water, floundering about like a huge cat-fish in a shallow mudhole. A. belonging to the shellbark family, peeled off his coat, vest, and pants, throwing them to N., waded across. "Better put your breeches on," says N. "Not yet my boy, there are some more of these holes," replied A. And sure enough there were any number of them. As they neared their boat, N. yelled out, "Oh, Lord, look out for the women." "Thunder," says A., "did not think there was a woman within a mile and a half," and looking up as he was picking his way carefully, he saw three colored women not twenty yards from him. Now A. is a very modest young man, but having his under-clothing on, did not think it necessary to try to make a fig leaf out of his hands as N. had done in his excitement on seeing them, but pensively remarked loud enough for them to hear. "Madam, if you wish to behold the beauties of nature, do not look at my friend there for he is just out of a mudhole, but look to the west and see what a beautiful sunset there is," and as they turned their heads he gently stepped out "around the corner," but around a clump of bushes, and was out of their sight before they could turn around. "Lordy! Whore dat man gwine to?" was the last heard from them.

A few moments more and our sportsmen were at their boats, and stepping in, to their intense disgust, found that N. had lost his cartridge bag, in which he had put the car tooks to the boat, when leaving it, to keep them from being stolen. There was no help for it; back he must go to look for it, and with a colored man to assist him in the search, off he started, leaving A. in the boat to watch the guns. Half an hour, an hour, passed by, and darkness had set in, and back came N, and his man Friday, to find that while he was gone A. had smoked up all the tobacco that had been saved, only leaving him enough for a dozen whiffs. Engaging the man to hunt for the lost bag to the morning and bring it to his store, and to take us down to the city, it was not long before the two sportsmen, whose luck was "fishorman's," if not hunter's, were at their respective homes, and N. safely in the bosom of his family. Here endeth their chapter of mishaps. GEORGIA.

Fish Culture.

—The young men of Machias, Me., have formed a Game and Fish Protection Club, with Samuel B. Hunter for President and H. R. Taylor, Secretary. They propose building a hatching house for fish spawn, from which to stock their rivers and ponds.

FISH IN GERMANY.—Fish, except in seaport towns, (and these are few and far between in Germany,) is a scarce and doubtful commodity; the Elbe and Rhine salmon very inferior in flavor to our own, and always dear. When produced on great occasions, this fish is almost always served cold, encased in a sour jelley if whole, or accompanied by varieties of mayounaise sauces if only portions of it are presented to the guests. Carp and tench, those muddiest of the fresh water finny tribe, are spoken of with bated breath, as of delicacies fit for the table of Apicius himself; but they are generally so disguised with vinegar and complicated flavorings that the mud may be said to yield to treatment. Not only are the salt water fish very inferior to our own, but of infinitely less variety. No sloping marble slabs, sluiced with fresh water, adorned with mountains of ice and forests of fennel; no piled up lobsters in gorgeous array, splendid sahoon, many tinted mackerel, delicate whitings or domestic soles, colossal cod, ministerial whitebait or silver sprats, will tempt at once your eyes and your palate; you will probably have to dive into an obscure shop, whence issues anything but invitingly "a most ancient and fish-like smell," when, in answer to your demands, a doubtful-looking marine monster will be pulled out of a mysterious tub at the back of the counter, with the remark, *Heut giebt's nur schellfisch* ("how unpleasantly," as Thackeray's schoolboy says of the monkeys, "they always smell,") or *dorsch*, or *barsch*, as the case may be. In the so-called fish shops, there will be all kinds of pickled herrings, (these form the foundation of that most popular of German dishes, *häring-salat*), bloaters, (*bücklinge*,) small dried sprats, (*Kieler Sprotten*,) perhaps even pickled salmon and a pot of caviare may tempt you; for the love of Germans for every kind of salt and dried fish (perhaps in default of fresh) is apparently an appetite that grows by what it feeds upon.—*Fraser's Magazine.*

[From the Rochester Express.]

A RESUME OF THE YEAR'S WORK AT THE STATE HATCHERY—OVER TWO MILLIONS OF FISH DISTRIBUTED.

On April 3d we gave in the *Express* an account of the origin and growth of fish culture, and some valuable statistics of the business done at the State Hatchery at Caledonia, with a table of the distribution of fish from that place during the present year up to that time. We are now enabled to give our readers a complete resume of the distribution for the entire season, from the books of Mr. M. A. Grecu, who now goes to the Hudson River to superintend the shad hatching:—

SALMON TROUT.		
Canandaigua Lake		121,000
Long Pond, Orange County		15,000

Creek at Newark, Wayne County		15,000
Streams near Amsterdam, Montgomery County		20,000
Total brook trout		800,000

TREEING FOXES.—Wish Miller, the well known hunter of Hoy's Wilderness, writes to the *Genius of Liberty*, of Uniontown, Md., as follows:—

"Some of our old hunters claim that they never saw nor heard of a fox treeing on the outside of a tree. I claim that I have treed both red and gray foxes up straight and crooked trees. For reference they can call upon John Russell Frey, of the Medland House, or Lindsey Messmore. We were hunting a few weeks ago in Garrett County, Md., when we started a gray fox; after a hard chase it was treed up a *straight tree* without a limb twenty feet from the ground. The baying of the hounds ceasing suddenly we went down and found the fox comfortably located in a fork at the tree. We concluded to start him and give him a chance for his life. He started pretty lively and in a few minutes was treed on a crooked tree. He refused to come down and was shot by one of the party.

The next morning being favorable we started a red fox, which we caught after a hard chase of three hours. The same day we bagged a large catamount, in the fight with which "Ranter" was disabled in one leg which we feared at first would prove disastrous to his noted fleetness, but happily it did not."

Natural History.

[This Department is under the charge of a competent Naturalist, indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

WOODCOCK ON HER NEST.

LAST July Mr. McIntyre, the photographer at Alexandria Bay, Thousand Islands, River St. Lawrence, presented us with a very pretty picture of a ruffed grouse on her nest, taken in the woods near by; and moreover, we were invited to visit the old lady herself at the time when she was engrossed by her domestic affairs. This photograph was of a character so rare and unique that we should have engraved it for the benefit of our patrons, though we neglected to do so. We did the next best thing, however, which was to send it across the ocean to the London *Illustrated Sporting and Dramatic News*, by which it was engraved in most accurate and attractive form, and this engraving was afterwards transferred to the Chicago *Field*, both papers courteously acknowledging the favor.

WOODCOCK ON HER NEST.

Herewith we give a transcript of a photograph, which is not only quite as fine, but much more rarely seen—a woodcock on her nest—and for this we are indebted, first to our correspondent Watts T. Loomis, of Little Falls, N. Y., and next to the exquisite skill of the engraver, A. W. Roberts. The bird was discovered in this position on the 21st of April, 1876, and had at that time four eggs in her nest, yellowish brown spotted with darker brown. Says the donor:—

"The picture is the work of our brother sportsman Mr. Wm. H. Abbott (an artist) of this place. The nest is, as you will see, composed entirely of dead forest leaves, and is situated in the midst of a thicket of hard wood brush on high land, but with springy land in near vicinity. To give you an idea of the time this nest was built, I state it was discovered 21st of April. On the 1st of May the grass in this neighborhood had started to grow only in the most sunny and favorable localities. The first barn swallows were seen here on the 30th of April. So you see our birdie took an early start, meaning to have her birds ready by 3d of July, if there should be no amendment to the game laws."

ROCKY MOUNTAIN MOLLUSCA.

THE Report of Hayden's U. S. Geological Survey for 1874, has just been issued. The zoology of the survey that year was under the care of Ernest Ingersoll (now in charge of the Natural History department of this journal, whose report forms a portion of the volume. The mammals of the Rocky Mountains have long been well known, and the case is somewhat the same with birds, the enthusiastic labors of Henshaw, Aiken, Allen, Coues, and others having given us very much information of the species and their habitats. The fishes and reptiles have received some attention, and are not numerous, except in the South, and much knowledge has been gained of the insects, crustacea and worms of the West. But the mollusks of the mountains—land, pond and river snails and fresh-water mussels—had been almost entirely neglected, and this seeming, therefore, to be the field most needing cultivation, Mr. Ingersoll's attention was chiefly turned to it. Something was found at nearly every camp, and when the collection was home and counted it was somewhat surprising to find over fifty species, only nine of which had been hitherto known to exist in the Central Province, where an extreme paucity of species, owing to the nature of its climate and soil, had been prophesied. Five of these species were new to science, and are described and figured.

The eastern slope of the Snowy Range is abrupt, and receives comparatively little rain. Westward of the summit, however, certain genera—*Zonites*, *Vitrina*, *Vallonia*, *Patula*, *Pupa*, *Succinea*, and *Pisidium*—were everywhere represented. Vitrinas and pupas were, perhaps, the most common forms, the latter being particularly numerous on the Sierras in the southeastern corner of the territory, where the new species, *Pupilla alticola* was traced up to the very limit of timber growth, and upon the face of precipitous cliffs of volcanic rock, in whose clefts only tufts of grass could gain a foothold. With the latter shell also occurred some small succineas, and a mollusk with a delicate, box-shaped shell, only one-tenth of an inch in diameter. Plenty of these little fellows, as lively as could be, were to be found at the astonishing height of 11,500 feet. They proved to be undescribed, and to belong to the sub-genus *Microphysa*, the two American species of which, heretofore known, are natives of the Gulf coast and the West Indies. Why this species should depart so far from the habits of its congeners as to thrive best in the arctic climate of these mountain tops, is strange. This *Microphysa* was afterwards met with in the valleys south of these Sierras, and in the mountains west of North Park. In this same southern group of mountains many other shells were found—at a lesser altitude, but where water froze every night in August—of the same species as existed in other parts of the territory. In a sunken, marshy lake south of the Sierra San Juan, were found thousands of various species of *Limnea* and *Planorbis* marked by extreme fragility, and showing large variation among themselves. But the astonishing fact about this pond was, that on the shore were found dead shells of the marine genus *Truncatella*, a broken *Area*, and small living salt water crabs. "That these are survivors of the period probably comparatively recent," says the writer, "when here was a salt water marsh that remained caught in this basin among the hills after the country for a long distance south of it had become dry land, seems very evident." A new species of coil shell (*Helisoma plexata*, Ing.) marked by a twisted appearance, resulting from a change of plane in the revolution, was discovered in St. Mary's Lake, Antelope Park, another isolated basin, and occasions many remarks upon distortions among fresh water mollusca. After mentioning the mollusks inhabiting the bitter saline lakes in the San Luis Valley, Mr. Ingersoll tells us that mollusks seem to flourish in mineral springs of both hot and cold water the world over; and describes at length the curious facts connected with the abundant presence of mollusks in the variously-composed mineral springs of Middle Park, where the temperature of the water reaches 100° Fahr.

Bringing together all that had been done before—of which a careful bibliographical list is added to the paper—and including his own work, Mr. Ingersoll found that 138 nominal species had been recorded as occurring between the Great Plains and the Sierra Nevadas. Of these, 49 were also Californian species; 15 occurred also in the Eastern United States; 8 hailed from the Colorado Desert; 7 were found all over the continent, and 8 all over the world; and 3 belonged in the Eastern Province, west of the Alleghanies only. This left 47 nominal species, whose range, so far as yet known, is confined to the Central Province. Many of the specific names in this list, however, rest upon very insecure foundations, and will no doubt soon be reduced to synonyms. With respect to their vertical distribution, 55 species out of the 138 inhabit heights exceeding 5,000 feet, and 10 species have been found above 10,000 feet. It is safe to say that, where there is moisture, a goodly collection of shells can be made in the mountains of the territories all the way up to the timber line.

The results of this almost pioneer study into the geographical distribution in the mountainous west will prove very important in future investigations. It shows the character of the molluscan fauna of that region; it shows that a range, or any number of ranges, of high mountains do not oppose an insurmountable obstacle to the migration, either of land or fresh water mollusks; that shells, while easily conforming to extraordinary surroundings, are at the same time readily modified by their environment, and that this inter-montanic region is not so deficient as has been supposed, either in the number of its species or in representatives of adjoining faunas; but that on the contrary it is favorable to pulmonate growth, except in respect to the scarcity of lime in the soil, to which cause we may probably attribute the fact that the more minute forms are in large majority.

THE NUTTALL CLUB.—For several years half a dozen young gentlemen interested in birds, among whom were Wm. Brewster, Ruthven Deane, W. D. Scott, Henry Purdie, H. B. Bailey, Henry W. Henshaw, and C. J. Maynard, have been meeting once a week in Cambridge, Mass., and comparing notes upon their favorite subject. Several of them had large private collections, and therefore were able to decide many knotty points, and contribute not a little to each other's information, and zeal. Two years ago a more permanent organization was effected, regular meetings were held throughout most of the year, and the little society took the name of the "Nuttall Ornithological Club," in honor of that eminent ornithologist whose home was in Cambridge. The club still exclude professional ornithologists from its circle, however, satisfying itself with numbering among its Corresponding Members most of the young ornithologists throughout the country. Another step in advance has now been taken by the club in the publication of the first number of a series of *Quarterly Bulletins* in neat pamphlet form. It is proposed by the club to issue sixteen pages quarterly. Starting, however, with twenty-eight, they desire to be able to continue at that size. We heartily hope their pecuniary success will justify it. This number is adorned by a beautifully executed plate of *Helminthophaga leucobronchialis*, a new species described by Wm. Brewster, who collected it near Boston. It most closely resembles the golden-winged warbler, but the entire absence of black or ashy on the cheeks and throat, the silky-white superciliary line, and the white lower eyelid are distinguishing marks. C. J. Maynard gives the history of the recorded occurrences of the English buzzard (*Buteo vulgaris*) in North America, and concludes that it may be a regular visitor in the Northwest. Important contributions to our knowledge of the nidification of the warblers are made by J. Warren in describing the nesting of the golden-winged in Massachusetts, and by C. M. Jones in his paper on the breeding of the black-throated blue warbler in Connecticut; while H. B. Bailey prints interesting notes of the birds he found breeding on Cobb's Island, Va., which seems to be a favorite spot for sea and shore fowls. "Notes on the Rough-winged Swallow in Pennsylvania," by Walter Van Fleet, and Mr. Brewster's article on the occurrence of certain rare birds in New England are of the same nature, and will be read with great interest. Ruthven Deane, who has made a specialty of gathering monstrosities of plumage into his collection, gives an astonishingly long list of cases of albinism and melanism which have come under his observation. The most valuable article in the number is a comparison of the two little flycatchers, *Empidonax Traillii* and *acadicus*, which have proved such stumbling-blocks in the way of collectors,

We should like to reprint this article and the others, also, did space allow. With all these excellences, showing a keen and discriminating observation of ornithology, it is a pity that the *Bulletin* should be marred from beginning to end with every species of printer's blunder for which no excuse can be found, with the most ordinary attention to proof-reading. The publishers, however, promise better typography hereafter.

We have given unusual space to a notice of this publication because it is a noteworthy circumstance, marking a gratifying increase in the intelligent and eager interest with which all objects of natural history ought to be regarded; and because it is a courageous and highly creditable effort on the part of the club that issues it. We ask for it a hearty support, and promise interested readers an abundant return for their subscription of $1.00 a year. Subscriptions may be sent to H. A. Purdie, State House, Boston.

JACK RABBITS AND COTTON-TAILS.

MONTANA TERRITORY, April 3d, 1876.

EDITOR FOREST AND STREAM:—

Your article on coursing, March 16th, last, will no doubt be of great interest to all true sportsmen. The jack rabbit of the plains must be no excellent substitute for the English hare for coursing purposes, and, in my opinion, does not receive justice in being condemned as vastly inferior for the table. I would ask those who thus condemn it, whether they have eaten a jack rabbit that had received the care and preparation from the cook that an English hare receives? Jack rabbits are generally eaten freshly killed. A hare, with no more care than a jack usually gets in cooking, would be as dry. Jugged jack rabbit is as good as jugged hare. Let doubters try it if they have a good cook. In my wife I have one—not three years from the old country, she, with all her leaning towards things English, admits their equality. When we kept hotel two officers of her Majesty's mounted police came to this territory to make purchases, and gave a dinner to a few prominent gentlemen here. Among the dishes was jugged hare. The dish to the American gentlemen was a novelty; to the two English gentlemen it was a treat, and was acknowledged by all to be excellent. I may also state that the strangers to the dish were very much surprised that jack rabbits could be tooth some. Keep them as long as they will keep sweet, and cook them as English hares are cooked, and you will not say they are vastly inferior. Prickly pear wounds, of course, don't count. You say we have no rabbits in America. That has been stated before, but I have not yet seen published, in this country, what constitutes the difference between a rabbit and a hare. When I was a young boy, I remember reading in a work on natural history (Cuvier's, I think), that the young of the hare are born with hair on them, and with their eyes open; the young of the rabbit are born without hair, and with their eyes closed. Is this *the* distinction? The fact that cotton-tails do not congregate in warrens ought not to weigh against the above physical fact, if it is a fact. (The wood duck builds and hatches in trees, but surely it is a duck.) If they (the cotton-tails) are hares, how account for there being no hybrids? It has been proved, to the satisfaction of the Zoological Society of London, that the hare and rabbit will not cross. Some man, about twenty years ago, did "ring in" a litter in that body, but the fraud was soon discovered. I have been trying for ten years to obtain a new born litter of jack rabbits with closed eyes, and have not yet succeeded, neither have I yet obtained a similar litter of cotton-tails; but this proves nothing. I only mentioned it hoping that some of your readers have been successful, and will mention the case. What constitutes the difference between a hare and rabbit? CILIBILL.

[Our correspondent is correct in his reading, and the young of the hare is born with fur or hair on and with their eyes open, while rabbits are born without hair and with their eyes closed. Moreover, the hare produces but four or five leverets at a birth, while the rabbits are more prolific, producing seven or eight of their young at a time. We agree, however, with our correspondent on the burrowing question, as, to our certain knowledge, the so-called cotton-tail rabbits do burrow, or at least live in burrows, although not in communities. However, taking all the evidence and the rabbit of Europe as standard, we have no species here which conform to their habits, and hence must agree with the naturalists, that there are no rabbits in this country. As to hybrids, Wood says that there are several instances where rabbits and hares have crossed, and in every case the father has been a rabbit and the mother a hare. He also alludes to the antipathy being so great between the two species that they are seldom, if ever, seen together. Now it is notorious that the jack rabbit and the cotton-tails are, in California at least, constantly met with together. We have flushed them a hundred times from the same patch of *tuna* or low-growing prickly pear, and yet their habits, as far as our casual observation goes, are widely different. The cotton-tail, when started, makes for the nearest burrow, either his own or that of some ground squirrel, and he goes off quietly, with an almost sneaking motion, while the "jack" starts off as though the hounds were after him, and, finding himself unpursued stops, generally when he has attained a distance of one or two hundred yards, and contemplates the cause of the disturbance.—ED.]

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—One common camel, *Camelus dromedarius*. Born in the Garden. One Peba armadillo, *Tatusia peba*. Purchased. One red fox, *Vulpes fulvous*. Presented by Wm. H. Krips, Philadelphia. Three young alligators, *A. mississippiensis*. Presented by John K. Valentine, Philadelphia. One opossum and young, *Didelphys virginiana*. Presented by Robina Dobson, Caseville, N. J. One laughing gull, *Larus atricilla*. Presented by Isaac M. Cochran, Philadelphia. One mocking-bird, *Mimus polyglottus*. Presented by Harry P. Mawson, Philadelphia. One Carolina dove, *Zenaidura carolinensis*. Presented by Mrs. Sarah Wilson, Woodstown, N. J. One black-tailed deer, *Cervus macrotis*. Purchased. One brown coati, *Nasua naerca*. Purchased.

RECENT ARRIVALS AT THE CENTRAL PARK MENAGERIE.—Five English pheasants, *Phasianus colchie*, presented by Mr. H. N. Munn, New York City; one robin, *Turdus migratorius*, presented by Mr. Hermann Goetze, New York City; one yellow bird, *Chrysomitris tristis*, presented by Miss Mary O'Shea, New York City; one horned owl, *Bubo virginianus*, presented by Mr. B. L. Sherman, New York City; one red-wing blackbird, *Agelaius phaniceus*, presented by Mr. Thomas Ryan, New York City; one kangaroo, *Halmaturus Bennettii*; one deer, *Cariacus virginianus*, presented by Mr. Thomas Messemer.

W. A. CONKLIN, Director.

—Connecticut sportsmen are asking for a repeal of the game laws of that State, and an enactment permitting the shooting of woodcock during July, as is the law in the adjoining States, making the close season from January 1st to October 1st, omitting July.

Sea and River Fishing.

FISH IN SEASON IN MAY.

Trout, *Salmo fontinalis*.
Salmon, *Salmo salar*.
Salmon Trout, *Salmo confinis*.
Shad, *Alosa*.
Land-locked Salmon, *Salmo Gloveri*.

For list of seasonable trout flies for May see our issue of April 27th.

FISH IN MARKET.—Fish are very plentiful, and as will be seen prices are very low. We quote from the prices current of Eugene G. Blackford:—

Striped bass, 3 to 8 pounds, 15 to 20 cents; bluefish, 3 to 8 pounds, 15 cents; salmon, Kenebec, 75; California, 30 cents; mackerel, 12½ cents each; Connecticut River shad, 35 cents; weakfish, 10 cents; white perch, 15 cents; Spanish mackerel, 50 cents; green turtle, 18 cents; terrapin, $12; halibut, 12½ cents; haddock, 8 cents; kingfish, 25 cents; codfish, heads off, 8 cents; heads on, 8 cents; black fish, 10 to 12½ cents; flounders, 10 cents; sea bass, 10 cents; eels, 18 cents; lobsters, live, 8 cents; sheepshead, 12½ cents; scallops, per gallon, $1; soft clams, 40 to 60 cents; brook trout, Canada, 50 cents; Long Island, $1; hard crabs per 100, $3; soft crabs 50 cents to $1.50.

—The general law governing the close season for black bass in New York State was off on May 20th. For some sections of the country this is very early, for the bass have not yet commenced to spawn.

—There will be no lack of bluefish this year, by all indications. Such immense shoals of bluefish on the coast were never known before at this period of the year, and the oldest fishermen say they never knew the herring catchers to be interrupted as they have been. Seines in many localities have done very poorly.

—The shad season in the waters about Staten Island has closed. Upward of 50,000 shad have been taken by the fishermen, one firm taking some 23,000, against 18,000 last year.

—The ice went out of the majority of the Adirondack lakes on the 13th of May, which is three weeks late. A letter to our friend Frank Bolles from Fenton, at "Number Four," says:—

"I have been to Crooked Lake to-day trout fishing. The ice is only just out of the lake, and I have to-day walked on ice in the South Bay sufficiently hard to bear me up. Snow sixteen inches deep in the woods in some places. Weather unfavorable, raining and snowing a little, but we took fifteen trout weighing thirteen and a quarter pounds; largest weighed two and a quarter pounds, and two others one and three quarters. He says they beat anything he ever saw for being in good condition. They are all filled up with fat inside. The spring is very backward, the buds not having started yet."

Wardwell, who kept the house at Stillwater, on the Beaver River, has rented it to Henry Burke, of Watsou. Wardwell's wife has become insane, and been taken to the asylum, and he has had to give up the house, which all the boys who have stopped with him will be sorry to learn.

—Last year the spring was very backward, and the Canadian streams were but torrents of snow water as late as June 25th. In addition to the difficulty of ascending the swollen streams, the salmon became gorged with capelin; and when the rivers did get down at last they had no time to dally with flies, and pushed on speedily to the upper pools, and even there they did not rise well. The promise for the present year is no better. Snow is very deep north of the St. Lawrence; nevertheless, four weeks will create a great change. We shall not wet a line before the middle of June.

DOMINION OF CANADA,
DEP'T OF MARINE AND FISHERIES,
FISHERY BRANCH, OTTAWA, 13th May, 1876.

SIR: Your letter of 8th instant, addressed to Hon. A. Mackenzie, having been referred to this department, I am desired by the Minister to inform you that Mr. Gilchrist has official instructions to grant angling permits on Rice Lake to United States citizens at a charge of *one dollar* each. I am, sir, your obedient servant,

W. F. WHITCHER.

J. L. WHITE, of Rice Lake.

MANY BASS.—The *Norfolk Virginian* says that Captain Minter, of the steamer L. G. Canuon, at that place, from the fisheries on Alhemarle Sound, reports that one of the most extensive hauls of rock (striped bass) ever made took place Saturday at the fishery of Messrs. Capehart & Son, at which time 1,680 rock, of a total weight of 34,525 pounds, was made. The haul also brought up some 300 shad and herring. Four hundred and seventy-five of the rock averaged sixty-five pounds, many weighing as much as eighty-five to ninety pounds. A second haul was made the same day, when 15,000 pounds were caught.

—Of the Oxford Fishing Club, at the Rangely lakes, a member writes:—

"This club controls the fishing in Rapid River from the foot of pond of the river to the old piers, near Umbagog, and also B pond. We have a nice club house on the carry, about half way between the Middle Dam and Umbagog, and expect to make a very nice place of it. We have managed to make the better class of the natives understand that it is for their advantage to see that the fish are not caught off the spawning beds and through the ice, and have just got two fellows indicted by the grand jury for having taken some trout through the ice in B pond. Of course this was done by the natives, and I consider the fact of their being willing to testify against poachers as a great triumph."

MAINE—*Bangor, May 15th.*—The ice is not yet out of our lakes. About two weeks hence there will be fine land locked salmon fishing at Sebec Lake. The water is at present unusually high in the Penobscot River and tributaries; said to be higher than at any period for the last nine years. Young salmon in unusual quantities are noticed at Veazie, Orono, and Bangor. They are smolts on their way down to the ocean. The boys are catching many of them, and mistake them for trout. The river is so very high at present that our up river fishermen are taking no salmon. We saw two taken in the weirs at Bucksport, this morning, that weighed forty pounds, one twenty, the other a little less. We had a letter from one of our wardens at Sebago Lake, yesterday, telling us that a few large trout had been taken in Crooked River. The land locked salmon had not shown in the river, but would be expected to run up in about a week. Those Sebago land locked salmon attain to twenty pounds. E. M. STILWELL.

PENNSYLVANIA.—*Philadelphia, May 22d.*—The shad fishermen are not encouraged to any great extent by the catch of last week. The catch does not bear out the expectations of the early part of the season. The gillers complain that the shore nets get them all, the shore netters that the gillers catch them; while the real fact is that the run in the Delaware has not been good for two weeks past. The fish that are caught are of good size, and will average as well as last season, which is almost one third larger than previous seasons, for a number of years.

The anglers at Fairmount caught a number of small rock fish last week; some as high as two pounds. SOULIS.

Blooming Grove, Pike Co., May 20th, 1876.—We spent two days, the 15th and 17th, trout fishing at Blooming Grove Park. The first day at Lord's Valley, where we took twenty nice fish weighing from quarter to half pound each, at the old mill, and in the pool below the bridge. The second day we waded the Shohola from Lord's Valley down to the "Farms," and made a good basket, 44 in all, one lady taking eighteen from the shore. The streams are yet high and rather cold for good fishing. We did not try the Blooming Grove stream; but a little later when the water is lower, some pound trout may be taken below the falls, which are within walking distance of the Club House.

JOHN AVERY.

NEW JERSEY, *May 16th.*—Mr. Frank Stratton and myself were at Echo Lake (Charlottesburg, N. J., *via* New Jersey Midland Railroad) last Monday, and in about four and a half hours killed forty-two pounds of perch and pickerel, running from two to four pounds each. Deeming this a good day's sport within fifty miles of New York, I send you this account. If you want to try it, "Uncle Billy" Wickham will show you the "best spots."

A. S. CASWELL.

MOVEMENTS OF THE FISHING FLEET.—Fifty-two fishing arrivals have been reported at this port the past week—forty-nine from Georges, two from the Banks, and one from Newfoundland with salt herring. The receipts of fresh halibut have been very small (about 300,000 pounds), and have found a ready sale, the quotations being, yesterday, five and three cents per pound for white and gray. Georges fish continue in light receipt, the total for the week being about 1,500,000 pounds. Prices are well maintained, with an upward tendency. The shore fleet continue to have unfavorable weather, and the receipts of cod and haddock have been light, with last sales at $1.50 per cwt. for cod, and 75c. for haddock. The reports from the mackerel fleet show the presence of mackerel in large quantities in Southern waters, but the unfavorable weather has interfered with fishing operations, and the catch has not amounted to anything. With better weather a good catch is anticipated.—*Cape Ann Advertiser, May 19th.*

WHITEFISH THAT TAKE THE FLY.

FLATHEAD AGENCY, M. T., April 28th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of April 6th, publishing my letter in regard to the whitefish (*Coregonus albus*), you ask me, in a note to the same, if I have ever caught the fish I speak of with a fly, either on the Atlantic or Pacific slope. Yes, repeatedly; on both. I should think it strange to fly-fish for trout, either in the Yellowstone, on the east side of the Rocky Mountains, or the Little Blackfoot on the west side, without catching more or less whitefish.

By the way, in the same number of FOREST AND STREAM, the sixth very excellent article by "Philo Ichthyos" contains the following, (last item but one):—

"*C. Cousii.* Coues' whitefish. Chief mountain lake, eastern edge of Rocky Mountains."

I strongly suspect this is the fish I mean; if so, add western edge of Rocky Mountains, and include the trout streams. CILIBILL.

—A new Massachusetts correspondent sends the following bit of fishing gossip, "to please his grandson," he says; but if he will kindly write more it will equally please the readers of FOREST AND STREAM:—

"The Spindle is a ledge of rocks projected into Massachusetts Bay off Swampscott. Nahant and Egg Rock lie southwest. It is broken so that there is a passage wide and deep enough for fishing vessels to go through in safety. There are fissures, diminutive bays, and holes; some of these last named are deep. When the tide is out, whatever unfortunate fish remains must wait for its return in order to escape from his prison. Not long ago a large striped bass got pounded. Some one of the fishermen happened to see some excitement, took a dory and rowed out to find what was the matter. Lo! there was a big seal fishing in the hole for a very large bass. Of course, Mr. Seal left for parts unknown, and as there is no extradition treaty with old Neptune the marine police of bony Swampscott did not pursue him. It did not help the bass any that Mr. Seal jumped overboard. The fisherman had an eye to business, and soon the monster bass was captured and the prize turned into greenbacks. One hundred years ago striped bass were common in these waters.

There is a river called Bass, or Saugus sometimes, running north of Chelsea Beach, in which bass and herring found breeding places. Another river on the north of Salem, bridged, connecting Salem with Beverly, which has one branch running west and another north by west, over so many years ago the name by which it was known was North, or Bass River. In the swift running incoming or outgoing tide fish weighing eighty pounds were taken. The writer has seen others, and has taken shad himself on a hook, with long hand-lines, from the bridge near and in the channel. Mill dams have destroyed these fisheries. It

is a wonder that the fish commissioners of Massachusetts have not obviated the difficulty, for there is no place where speedier or more profitable results would follow propagation. Even now there is a little stream flowing through the streets of the city of Lynn, where you may see every season thousands of alewives running up to breed, for the brook, it is believed, flanks the dam. If you want to do so, Eddie, you can kick them on to the dry banks when you come into this region."

CANADIAN FISHING AND FISHING PRIVILEGES.

HOW TO AVAIL ONESELF OF THEM.

CHATHAM, N. B., May 19th, 1876.

EDITOR FOREST AND STREAM:—

During the season I will send you such items as I may have time to write. The Intercolonial being now open for traffic as far as the Restigouche, I presume anglers will seek our waters in increasing numbers. Many are prevented from coming by an impression that has gone abroad to the effect that all the waters worth fishing are under lease to private parties. Such, however, is far from being the case, as there is much excellent water still absolutely free to all the public, and much also under lease to persons who permit any angler or anglers to fish their leaseholds, at say $1 per rod per day. To give one instance, I may mention that Overseer Hickson, of Bathurst, can give you $1 per day permits on the rough waters of the Nepisiguit, and that is now rendered so accessible that you may leave St. John in the morning and reach it in time to camp the same evening. For salmon fishing it is, as you know, unsurpassed. Of the free waters, the Northwest Miramichi, in the vicinity of the Sevogle, is among the most accessible and sure for salmon. There is excellent grilse fishing also at the Big Hole on the same river. By making arrangements in advance one may leave St. John in the morning and reach the Big Hole camping ground same evening. The Sevogle requires four or five hours more travel. The best fishing I had last season was on the Northwest Miramichi, and I intend to divide the time I shall devote to salmon fishing this season between the Nepisiguit and the Northwest.

For trout fishing, the Southwest Miramichi at Indiantown, the Tabusintac, and the Tracadie are unsurpassed by any waters I have ever known. The fishing at Indiantown is of short duration, however, commencing about June 1st and ending about the 20th of the same month. There are trout and salmon both there after that period, but it is not *the* Indiantown fishing. I went there on the 8th of June last year from Chatham, drove up in the afternoon and had the evening's fishing. The next morning I was at it early, and returned to the work again as soon as breakfast was over. At two o'clock I was tired, and packed up for the return trip. I had caught 53 pounds of magnificent trout fresh from the sea, and ranging from 3¼ pounds down to ¼. Now that the steamer Andover is running regularly between the towns of Chatham and Newcastle and Indiantown, we can go up from here in two and one-half hours. It is a privilege that one may sigh for anywhere else but here.

The Tabusintac is good from 1st of July to late in the fall. The average size of the trout taken there is about 2½ pounds; they run as high as 5 and 6 pounds occasionally.

The Tracadie fishing is similar to that of the Tabusintac—good the whole season—and this trout are a better average weight. I intend to try Indiantown on the 24th (Queen's birthday). I am not very sanguine of success, but will drop you a line telling you what luck I have, after my return. D. G. S.

WHALE BONE TIPS FOR RODS.

NEW BEDFORD, May 15th, 1876.

EDITOR FOREST AND STREAM:—

A gentleman of your city whom I met at the Wambeck House, Jefferson Hill, Town of Jefferson, N. H., in August, 1851, who was very much interested or rather taken with my trout gear, has lately written me a letter requesting me, if I had no objection, to give him through the columns of FOREST AND STREAM information in regard to the material of my fishing rod tips which he saw at that time. I freely give the gentleman, and also the numerous trout reading friends of FOREST AND STREAM the information asked. In the first place, the tips I have used in my rambles after trout in various parts of the country for the last twenty-five years are not made of wood as he supposed, but from bone. I made my first whale bone tips in the spring of 1851 and from that date to the present time, twenty-five years ago this spring, I have had no trouble, bother, or perplexity to myself, for I am never troubled as many fishermen are in this locality with a broken tip, where much or rather most of the fronting like that of Bristol and Plymouth counties is done through a swampy part of the country. If the information I have imparted will be of service I shall be more than compensated for my trouble in writing this letter. N. T. WATERMAN.

SPLIT BAMBOO.

PHILADELPHIA, May 3d, 1876.

EDITOR FOREST AND STREAM:—

In your issue of April 13th the remarks of your correspondent in reference to one way of making a split bamboo rod, stating, by way of comparison, some objections to the Krider rod, have stirred up many honest men and anglers who undertake to say that Krider's peculiar method of fitting the strips on the centre enamel plan is the best way to make a rod.

It is, however, safe to say that in the discussion of this subject not one of those anglers referred to had any particular interest other than giving facts, which are worth volumes of speculative opinions or theory. It further says that I have stated his objections to the above mentioned rod imaginary, which were very fairly answered to my notion. To sustain those objections, H. should have tested one of those rods of equal size with his six-strip outside enamel, and give us facts. He has failed to do this, therefore his objections are not worthy the least attention. He however disposes of the split bamboo question in an ingenious manner by simply referring all whom it may concern to an admirable article in FOREST AND STREAM, from no honest brother of the rod, over the signature of "Ted Grayson," who, by-the-bye, should be no mean authority on the split bamboo question, he claiming to have made as many rods as any amateur in America, with one exception. T. G. dashes in and strikes at all who chanced to give an opinion in favor of the centre enamel rod. He also makes the wonderful discovery that we have a wrong name; that the slightest acquaintance with Webster would have taught us our error. He even goes so far as to quote from the great German chemist, Stockhardt, on the nature of the bamboo, and gives us to understand that the enamel is less than the hundredth part of an inch in thickness. If that be so it affords neither strength nor elasticity, as in the construction of a fine rod there must be shown some amount of workmanship. With the first touch of sandpaper off goes "Ted Grayson's" less than a hundredth part of an inch enamel. I do not profess to be favored with such remarkable knowledge as your correspondent; still, with my slight acquaintance with Webster, as well as other authorities, I find the name enamel given to this very hard and elastic as whalebone covering of the bamboo very proper, and known as such to those interested in rod making. If your correspondent undertakes to build a rod on the centre enamel principle from lower end of butt to extreme tips, he will find I am stating a truism when I say that it requires skill, patience, perseverance, and good temper. He should also be aware that this most delicate of instruments, the light trout rod, can in no possible manner have any comparison to hollow cast iron columns, which don't at all apply to fishing rods.

Experienced fly-fishers are aware that in the use of the three-piece trout rod, in the hooking of a fish of any considerable size, the greatest strain is brought to bear at about thirty-four inches from the grasp, or first ferrule, which is consequently the most likely place to snap. For the purpose of illustrating the difference in the methods of fitting up the strips I send end views of upper end of butts. First is the eight-strip centre enamel; second is the six-strip outside enamel. The dark lines represent three thirty seconds of an inch of the hard elastic covering or enamel. W.

TROUTING IN MASSACHUSETTS.

NEW BEDFORD, Mass., May 15th, 1876.

EDITOR FOREST AND STREAM:—

Trout fishing commenced here with a rush, the law being off the 20th of March, and parties were out the next day and have kept it up until within a few days, at which time the fever heat seems to have somewhat died out. I have not as yet learned of any large catch, except a quid. Many amateurs round about these parts seem to be of the opinion that very early fishing is the best, but we veterans of rod and reel have learned better things, more particularly in a very late and cold season like the present. We think there is not much sport or comfort rambling for trout with an overcoat on buttoned up to the chin to keep from being chilled through. When such is the case is it not fair to suppose that trout feel about the same as humans, and don't care to rise and trouble themselves with the outside world? Trout take the hook, we think, the best from the middle of May to the last of June better than at any other time; at least this has been the experience of the writer for the last twenty-five years in this section of the country. Dr. Joh Sweet, the celebrated natural bone setter of our city, and your humble correspondent, were out a few days since with our rods and baskets at a brook we call "over there" in Plymouth County, and the two of us caught forty-nine very handsome speckled beauties. We shall try the front the coming week in the brooks and streams in Wakefield, R. I., where we know of

A sweet shady nook by the babbling brook,
That carries his father's old mill.

We were there last season; had good luck as well as sport, and both of us enjoyed the sport hugely, not only trout fishing in Wakefield, but at other brooks in the south part of Rhode Island; also salt water fishing at Narragansett Pier. We expect good sport and full baskets this season. We are bound to try them as soon as we get a few warm days.

Though the season's scarce begun,
Trout are there, we warrant,
Tickled by the April sun,
Playing hide and seek they run
Up and down the torrent.
Meanwhile for those gleesome trout
Mischief we're preparing;
From that stream they must come out,
Just to take an airing.
Pretty sport to strike a trout,
Brilliant sport to catch him,
Happiness to swing him out (twenty ounces say about),
Glory to display him.
Heavens, how beautiful he looks!
Naught that water swims in
Mates the monarch of the brooks,
Dressed in pearl and crimson,
In the spring time of the year,
When the streamlet's brawling
Dashes on as winged with fear—
There unchafed by rocks, and hera
In the white cascades falling—
Oft we wander by its side,
Listening to its wrangle,
As a clam at highest tide,
Happy while we angle.

N. WATERMAN.

FISHING FOR SALMON AND TROUT IN LAKE MERCED.

SAN FRANCISCO, May 10, 1876.

EDITOR FOREST AND STREAM:—

Two days ago I returned from a day and a half's fishing in Lake Merced. I stayed at the club house, where I found pleasant sleeping berths and other convenient accomodations, of good boats, &c. The waters here consist of two lakes separated from one another by a narrow passage. One is called the Upper, and the other the Lower Lake. I found the water in the Upper Lake rather thick, but that in the Lower was clear. I first essayed the Upper, bait fishing with a long rod from a boat, preferring a long rod on account of my idea that all game fish are more or less shy of the movements or appearance of a boat. I angled with a single gut leader, and with two hooks of a medium size, one hook about two feet from the other, the upper hook with a half foot snood. I used a float. The bait employed was boiled shrimps, with the heads broken off, and the hook inserted from the point of the tail towards the end of the body. Notwithstanding the roily condition of the water I hooked and landed a young salmon of two pounds and three quarters. He fought with his usual gameness. I struck two others but lost them. I then went to the Lower Lake and commenced fishing from my boat anchored close to a sandy point on the shore. My long rod enabled me to fish a considerable distance out. I had one or two bites, but the float failed to disappear sufficiently deep for me to strike. I had risen early, and therefore felt a little torpid. I reclined on the bottom of the skiff, and watching my cork fell into a doze. Presently after I was aroused from my state of lethargy, by a sudden and tremendous "whirr," "whirr," of my reel and the rod by my side moved and much bent. Up I was, of course, in an instant, seized the rod and found myself dealing with a very strong and active fish. I played him for about ten minutes, the Superintendent coming up in his boat and witnessing the vigorous contest between fish and angler. In a moment the hook and line came back to the defeated fisherman, and the fish went, no doubt, on his way rejoicing. We both got a good sight of the temporary captive to his leapings and closeness to the top of the water, and the foreman, as experienced fisherman, placed his weight at a good seven pounds. He was a Lake Tahoe trout, a fish nearly similar to our brook trout.

After this untoward, but rather pleasantly exciting event, I captured three young salmon of the weights, severally, of two pounds and three quarters, two pounds and one quarter, and one pound and a half. I had many good bites besides, and am almost ashamed to have to confess that I hooked and lost as many, probably, as eight fish, some of large size, and most of them excessively vigorous young salmon.

The Tahoe trout is not so hard to subdue as the salmon, yielding rather easier to the bot of one's rod. The above was the work of one day. The next, I secured a Tahoe trout of three pounds weight, and have again to make a clean breast of it, by stating that I hooked and lost a very large salmon, and several more of a larger grade. I attribute the loss of those to not striking them quite strong enough when they bit, as when the hook touches some hard part, such as the upper jaw, it does not enter deep enough for the barb to take a fast hold. But we live and learn, as much in fishing, as perhaps, in any other act. To strike a fish just about the right time, and sufficiently strong after the float disappears, seems to me one of the nice points in angling. There is for this, only for every man to use his best judgment. While on my short trip I enjoyed the finest Californian weather, and this will tell emphatically how fine it was. E. J. HOOPER.

FISHING NOTES FROM MARYLAND.

PHILADELPHIA, May 18th, 1876.

EDITOR FOREST AND STREAM:—

For two weeks I have been fly-fishing for black bass on the Potomac River at Williamsport, Md. The season was too early for good sport, and I found the water and weather unfavorable, yet I got enough fish with a trout rod to prove the superiority of the fly to minnow bait, as each day I was out I beat any one bait fisherman there. The largest base I got weighed from 3 to 3¾ pounds. I found no spawn in any of the specimens I examined. Williamsport, Md., is the terminus of the Western Maryland Railroad, and can be reached from New York by rail *via* Philadelphia, in about eleven hours, either by way of Harrisburg, Pa., or Baltimore. Hotel charges, $1.25 per day. A boat and boatman costs $1.50 per day. Allow me to grumble at such of your correspondents as give catches of trout by numbers of fish without specification of weight. You do much to protect fish, and I think you can do still more in giving such correspondents a gentle rebuke, by printing their figures thus "——." One grumble more before closing. I hate to read in a sporting paper notices of implements for spearing or aiding the spearing of fish. Such work should be discouraged by an "honest angler." B. BACKLE.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

SEAWANHAKA YACHT CLUB.—We have received the programme of the races to be held under the auspices of the popular Seawanhaka Club. The first is a Corinthian race for sloops belonging to any recognized club, to be sailed on June 10th, but as this is the date fixed for the opening regatta of the Brooklyn Yacht Club, it is to be hoped that one or the other will be changed. There will be one prize in each class in which two yachts start, and a second prize in each class in which four or more yachts start. Each yacht shall be sailed, and, as far as possible, steered by her owner, and may carry a sailing master and her cook and steward, none of whom shall in any way assist in the management or working of such yacht, in addition to one amateur for each five feet of her length on deck. If at any time during the race the owner surrenders the control or management of his yacht to his sailing master, he shall be deemed to have abandoned the race.

The course will be from the line between the club steamer and Fort Wadsworth, to and around buoy No. 10 on the Southwest Spit, keeping it on the port hand, thence to and around the Sandy Hook Lightship, keeping it on the starboard hand, and return over the same course. Yachts must keep to the eastward of buoys No. 9, 11, 13, on the west bank, and outside of buoy No. 5½ on the point of Sandy Hook going and returning, and will pass between the club steamer and Fort Wadsworth on arriving home.

The second race is for schooners of the Atlantic, Brooklyn, Boston, Eastern, New York, and Seawanhaka Yacht Clubs, and will be sailed on the 13th inst. Prizes as in the first race. The course will be from buoy No. 5, off Sandy Hook, twenty miles to windward and return, if the wind permits, or twenty miles to leeward and return. Yachts will pass between the judge's steamer and the buoy going out and coming home, and at these points the time will be taken. After starting the yachts the steamer will proceed to the turning point, where a buoy will be anchored, which all the yachts must round, leaving it on the starboard hand. Should any yacht reach the home buoy (No. 5, off Sandy Hook) in advance of the judge's steamer, she must pass within one hundred yards of it, and the owner shall take the time when the buoy bears due southwest, reporting the same immediately after the race to the Regatta Committee.

Entries are to be made in writing to Mr. M. Roosevelt Schuyler, No. 54 William street, until noon on the day preceding the race.

—The Perth Amboy's Yacht Club annual regatta will occur on Decoration Day, the 30th inst. About a dozen yachts, all open boats, are enrolled in the club, and all are expected to enter, and will be sailed by the owners only. The course will be the usual one in Raritan Bay, and the start and finish will be off the club house. The races of this club are always among the liveliest and best managed of the season, and reporters and members of the press will receive the usual attention at the hands of the committee. The 9 A. M. train *via* Staten Island Railroad from foot of Whitehall street will arrive at Perth Amboy 45 minutes before the start. Trains return to New York *via* P. R. R., L. B. R. R., and S. I. R. R. at 2:55, 4:10, 4:40, 6:30 P. M.

THE AMERICA'S CUP.—The regatta committee of the New York Yacht Club has received a reply from Major Gifford, the owner of the Canadian yacht Countess of Dufferin, to the action of the club taken at a recent meeting. In it he declares his willingnes to sail three races, as proposed by the New York Club, viz: one over the inside course and one outside, the third, if necessary, to be decided by lot. But he insists that only one yacht shall be named for all three races, and also that this yacht shall be named on or before the 1st of July. The club will hold a special meeting to-day to consider this proposition.

—The annual regatta of the Brooklyn Yacht Club will be sailed June 6th. Entries must be filed before nine P. M. Saturday, June 3d, with C. F. Lippitt, 42 Court street, chairman of the regatta committee.

QUINCY YACHT CLUB.—The regatta committee of the Quincy Yacht Club, of Quincy, Mass., have prepared the following programme of places, dates, courses, etc., for the regattas of the ensuing season:—Saturday, May 27th, Quincy Point; Saturday, June 24th, off Quincy Great Hill; Saturday, July 22, same place; Saturday, August 26th, same place. On Saturday, June 17th, the yachts of the club will rendezvous at Quincy Point by eight o'clock A. M., at which time a review will be held by the Commodore, after which the fleet will repair to Grape Island, where dinner will be prepared; the return trip will be made in the afternoon. Members of the club not owning yachts will be furnished with transportation. It is expected that there will be an extra regatta on July 4th. There will be a second prize in each class, in each regatta, except in case that only two yachts start in any class, in which case only one prize will be given.

CENTENNIAL ROWING.—A recent cable dispatch from London says that the differences between the Dublin University Boat Club and the Rowing Club have occasioned the secession of the leading members of the former, including the two Barringtons and Pentland. They will join the Rowing Club, which will organize two crews for the Henley Regatta, the first crew consisting of Messrs. Garde, Armstrong, Smith, and Hickson, and the latter including the two Barringtons and Pentland. The two crews will afterward be consolidated, and go to the United States as the Irish international crew. It is possible that the Boat Club may form an independent four for America.

—Among the illustrations which will appear in the Gloucester Centennial Book, are a fleet of fishing vessels to be on exhibition at Philadelphia, comprising the pink stern standing room boat of 1776; square stern standing room boat of 1820; pink stern, cuddy forward, 1830; square stern schooner, 1840; square stern, a little sharper, 1850; Georgesman, 1876; mackerel catcher, 1876; seiner, 1876; banker, with high quarter deck and blunt bow of 1800 and banker of 1876, seine boat, etc. These form a fine collection, and taken as they are from the original models, give the reader a correct idea of the advancement made in vessel building the last century. The clippers of to-day form a striking contrast with the vessels of the days agone.

A NEW WAY TO ROW A BOAT.—No one that has rowed much on any of our many boating courses but has been warned by a sharp call of "Look out ahead!" and glanced hastily over his shoulder to find a collision imminent—a collision to be avoided only by holding "hard all." Every sportsman has felt that, in rowing, his boat was wrong end foremost, and, to see where he was going, in many an excursion has resorted to pushing or paddling, at the expense of a great loss of power. Theo. Winthrop has said that "it took three thousand years to learn that we had been threading our needle at the wrong end;" hence the sewing machine.

Mr. Lyman, of Middlefield, Conn., realized that for centuries we had been rowing backward, and he put his wits to work to set the matter right. In company with the inventor and Mr. Harris, of the FOREST AND STREAM, I had the pleasure, on Wednesday, of making a trial of the "new fangled contrivance," and was very agreeably surprised to find that it worked smoothly and effectively. The oars, or rather, to speak properly, the sculls, are made in two pieces. The outer end of the loom, or portion of the scull inboard, is fastened by a ball and socket joint to the gunwale, and a short distance forward, by a similar joint, is fastened the shaft, or outboard portion. A light iron lever, or connecting row, joins the two pieces in such a manner that the blades of the oars move in the same direction as the handles, reversing the ordinary method.

The action is absolutely without noise, which will be appreciated by every one who has attempted to row on to game. Much to my surprise, I found no trouble arising from the inability to feather, the sculls leaving the water with ease. The sculls, although but eight feet long, gave as much reach and power, apparently, as could have been obtained in the same boat with ten feet sculls, a length that would have necessitated outriggers. By simply drawing the looms against the gunwale, the blades are folded back as a bird folds its wings. Although the gear can be detached instantly, the sculls cannot become unshipped by accident, and there will now be no occasion for the use of "swear words," that so generally follow the loss of a row lock when among the reeds or brush.

No one who has tried the gear will ever again be contented to use any arrangement that will not enable him to see where he is going. It is adapted for every boat propelled by oars, except, perhaps, outrigged racing shells.

SCULLS.

THE "GUNNING SKIFF."—By invitation of Mr. Oscar B. Smith we had the pleasure of inspecting last week a new boat, called the "Gunning Skiff," which seems to be an improvement on the Barnegat sneak box. It was built by Sam T. Gritman, of South Oyster Bay. Her dimensions are 11 feet keel, 12 feet 9 inches over all on deck, 4 feet 3 inches beam, with a swinging centre-board, which acts of its own accord when the boat is sailing in shallow water. The boat is also supplied with a lug sail of ten yards of canvas; mast, 10 feet; sprit, 14½ feet; sail nearly square. She is decked over 4 feet forward and 2 feet aft, washboard 1 foot wide. The combing is 4 inches high, and arranged for thatching with grass. Depth, 15 inches from top of combing. The sail is made so as a reef can be taken when necessary.

We had the pleasure of testing this little craft upon the rough waters of the bay, and found her serviceable and seaworthy, fully meeting the expectations of the builder and owner.

THE CENTENNIAL REGATTA.—At a recent meeting of the Centennial Regatta Committee it was stated that the cost of the proposed regatta on the Schuylkill, in which crews from all nations were expected to compete, would be about $25,000. This included the purchase of prizes for amateur contestants, the preparations for accommodations, the money prizes for professional contestants, and the expenses for the running of the regatta. The Schuylkill Navy has already succeeded in raising the bulk of this amount, and the balance, it is expected, will be contributed by the various boat clubs, etc. Mr. A. Wright Sanford was unanimously elected secretary, with instructions to confer with the boat clubs throughout the State, and Mr. J. Schuyler Crosby was elected treasurer.

THE BOSTON BOAT RACE.—The race between the Faulkner-Regan and City Point crews was rowed on Charles River on Saturday last, a mile and a half and turn, "best and best," working boats, to be rowed on the gunwale for a purse of $1,000. The Faulkner Regan crew's time was 20m. 18s.; the City Points 11s. later. Both crews made claim of foul, and on Monday the race was rowed over again, Faulkner-Regan winning without difficulty in 20m. 20s. The time of the City Point crew was 20m. 49s. Fifteen thousand persons were present.

—The professional four crew to row at the Centennial Regatta, are now exercising on Newtown Creek. The names of the six from which the four is to be selected is as follows:—

Name.	Height.	Rowing Weight.	Age.
John Biglin	5.9½	160	32
F. A. Plubsted	5.10½	160	26
J. W. Maxwell	5.11	170	32
T. C. Elliott	5.9½	155	24
James Plaule	5.9½	170	27
John Styles	6.0	172	24

Englehardt, the single sculler, is hard at work on the creek preparing for his match with O'Neil, which is to be rowed at Saratoga in July next for $1,000 a side. O'Neil has only been in training since Monday, while Englehardt has been at work for three weeks.—*Brooklyn Union.*

CENTENNIAL REGATTA.

PHILADELPHIA, May 22d, 1876.

EDITOR FOREST AND STREAM:—

The advices from the other side of the water regarding the entries for the Centennial regatta are very encouraging. The absolute entries cannot now be known, as they will not come much before the time of closing. The crew that was certain from Dublin is just as certain since the disagreement between the Rowing Club and the Boat Club, the prospects now being that the two crews will be sent. Cambridge is likely, besides the crews already promised, to send one to represent Trinity College. The amounts of the professional prizes has not yet been announced, but the announcement should be made at once. The matter, which is entirely in the hands of the Executive Committee, and out of the Schuylkill Navy's powers, is being attended to, but a trifle more promptitude would not be amiss. On Saturday the Schuylkill presented a lively scene, as in addition to the usual rowing, there were numbers of crews out practicing for the regatta of the Navy, June 17th, and of the Vesper Club, June 3d. The Commodore on Saturday took Mr. J. Russell Young, of the New York *Herald;* Mr. Austin, of the London *Times;* and Mr. Millet, of the Boston *Daily Advertiser*, with several other newspaper men, over the course. The general verdict was—splendid. SCULLS.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

T. S. S., Washington, D. C.—What is the price of the Kay concentrating cartridge? Ans. $3.50 per 100.

SENECA, Syracuse.—It is needless to send us details of base ball matches, as we have space for only the briefest mention.

C. S. BARRETT.—What is the best book for beginners on taxidermy? Ans. In general work, Maynard's "Naturalist's Guide;" for birds, Coues's "Field Ornithology."

SUBSCRIBER, Rochester, N. H.—The medicine for your pointer pup was sent to Rochester, N. Y. Give us your address and we will at once mail to you enough powdered areca nut for your pointer.

J. F., New York.—Can you inform me where the "Bay Ridge Rifle Club's" range is located. How near or in what direction from the village? Ans. From 4th to 7th ave., on the Railroad property.

G. W. H., Philadelphia.—Where can the Rob Roy canoe be obtained, and what is the price of same complete with sails, etc.? Ans. Waters & Baleh, Troy, N. Y., or — — Jarvis, Watkins, N. Y. About $100.

J. F. A., Middletown, N. Y.—I have a Winchester rifle, old model, 16-shooter and rim-fire. What is the cost of changing rim-fire Winchester rifle to a central-fire? Ans. Your rifle cannot be altered to take the central-fire cartridge.

H. C., Philadelphia.—Can you tell me where I can get a gun case made out of paper mache? Are they made at all; if not, don't you think they would find a ready sale, being light and handy? Ans. Do not know of any being made, and do not think they would equal leather.

PROCTOR, Shrewsbury.—Can you tell me if there is good trout fishing in Sullivan county, Pa.? Ans. There are many trout streams, but the fish are not large, and the accommodation is very poor, unless one can fall upon a private house. The taverns are few and far between.

W. R., New York.—Can you inform me of any person living within one hundred miles of New York to whom I could go in the month of July for a few days' woodcock shooting? Ans. Mr. A. J. Bayler, Tenafly, N. J., can furnish you with fair woodcock shooting. Write to him for particulars.

J. C. P., Syracuse.—Can you give me the address of one or more reliable dealers in eggs for collection? Ans. S. L. Willard & Co., Utica; S. F. Sherman, New Hartford, N. Y.; E. L. Hudnut, Orange, N. J.; C. J. Maynard, Ipswich, Mass.; J. H. Baily, New Utrecht, L. I.; Fred A. Ober, Fernandina, Fla.

PHIL., Gilead, Mass.—Can you tell me where I can get a few pair of young mink; also the price, and whether it is or has been a practical thing raising them? Ans. There are a good many breeders of mink in this country and Canada. Address P. Resigue, Verona, N. Y., or Phillips & Woodcock, Cancadea, N. Y.

SETTER, Indian Lake, N. Y.—I have a setter pup about four months old; the hair is coming off his head, and small scabs appear; would be obliged to you for a remedy, and also what? Ans. Anoint his head with compound sulphur ointment. Give him little or no meat, but plenty of exercise—wash his head occasionally with carbolic soap.

G. M. G., Honesdale, Pa.—What is the usual length and breadth or general dimensions for building an ordinary ten-pin alley, and where can I purchase balls for same? Ans. Ten-pin alleys are built of all lengths from 50 to 60 feet. Balls, pins, and all information can be procured from Messrs. Peck & Snyder, No. 126 Nassau street, this city.

J. T., Locust Valley.—Please inform several of your readers whether the words "open to all comers," in the National Rifle Association's programme for matches at spring meeting include persons not members of the Association? Ans. "Open to all" means that the matches are open to all riflemen, whether members of the N. R. A. or not.

J. C. H., Greenville.—I have a red Irish setter pup five weeks old. He has a bunch growing under his throat as large as a hen's egg. What is this bunch, and what is the cause of it? Can you give me a remedy? Ans. It is not an uncommon thing for young dogs to be affected as yours is. Thrust a lance or sharp knife into the bunch, and it will discharge and soon be well.

W. T., New Haven.—Please inform me to whom I shall apply for privilege to fish the Miramichi, in Canada? Can you tell me whether, for my reason, the fishing is better or worse than three years ago? Ans. For lease apply to W. F. Whitehot, Esq., Ottawa, Canada. For fishing privilege, address Chris. A. Robertson, St. John, New Brunswick. For salmon prognostics see Sea and River Column.

SUBER.—What is a Helgramite? Where do they feed? I wish to get some for bait. Ans. What are known as Helgramites in the South and Dobsom's in the North, are the fully grown larvæ and pupæ of several aquatic species in the family Sialina. Their feeding ground is chiefly in sluggish rivers. They are rare in mountain streams or head springs. They will be found in the shallow parts of the stream, under stones or submerged driftwood, or buried in the soft mud along the banks.

ONO, Lock Haven, Pa.—1. Please inform me the best way for preparing angle worms for bait. 2. What arrangements have the makers of the Ward-Barton gun made for manufacturing, and when will they be completed, why have they been so long making them, and will the gun be as superior an arm as promised? Ans. 1. Place your angle worms in sand and they will clean themselves of earth and become fresh and red. 2. We believe the company has not been formed, owing to the depression of business.

G. A. A., Montreal.—Please inform me as to the fishing acts as regards bass and pickerel for the States of New York and Vermont? Ans. The general close time for black bass in New York State is between January 1st and May 26th. No general law for pickerel, although where there are local close seasons they expire May 1st. In Vermont the close season for bass is from June 1st to August 1st. No close time for pickerel, but wall eyed pike and pike-perch are protected between April 1st and June 1st.

E. H., Cincinnati.—On my summer tour in Sandusky Bay and in the vicinity of the Bass Islands, I prefer sailing to being sailed. Having some practical knowledge in sailing a boat I would like to add theory, and will thank you for recommending to me a book treating on the art of sailing a boat, and on the nomenclature of the rigging, also on boating and yachting generally? Ans. There is no American work which will meet your want. Vanderdeckoo's "Yacht Sailor," an English book is the best that we know of.

* * *.—A correspondent who is raising canary birds says that he was informed that he must take away the cock bird, or it would kill the young ones. He did so, and a few days after the little things died. With the present brood he tried leaving the cock bird in the same cage, and carefully watched its movements. He found that the male first fed the female bird, which received the food and passed it to the young. Evidently the female alone could not prepare the food fast enough for so many young, and was assisted in the process by the male.

SMITH, Rossmore Hotel.—I contemplate going down to Barnegat this coming summer to spend a month or more, our party consisting of eight or ten gentlemen and their wives and families. Being a constant reader of your paper I should like to know of a pleasantly situated house near the water on the main-land somewhere near Barnegat? Ans. Go to the Carman House, Forked River, New Jersey, E. H. Frame proprietor. This house is three miles from Barnegat village. Take New Jersey Southern Railroad, via. pier 8, North River.

P. S. S., Pittsburgh.—I had a very fine pointer sent by express to me a few days ago, but my friends differ in their opinion regarding him. Some say that they think he is part setter, and so on. He is rather full in the head, short, and, as one of my friends says, like a bulldog, only for his ears; he has large legs, and a very slim tail; color lemon and white. I wrote the friend that I got the dog from; he says he is a cross between the spaniel sader and an English pointer. Is there such a dog as a sader? Ans. We never have heard of a variety of dog called *sader* or sader spaniel. There is a kind of dog called "soonere," and yours probably is a cross of the pointer and "soonser."

E. C., East New York.—Mr. Seth Green has recommended me to you. Please send me your December number that contains the index of contents of 1875, and please inform me through the columns of your paper how I can raise gold fish in a forty gallon barrel, and what is needed. I have some very fine large breeders. I am going to try also the experiment of raising them from impregnated spawn, &c.? Ans. For instruction how to raise gold fish, see FOREST AND STREAM; May 28th, 1874, and November 18th and 18th, 1875. Have sent you papers and index. T. B. Ferguson, Fish Commissioner of Maryland, 102 North Charles street, Baltimore, devotes much study to the breeding of gold fish.

MARVINEZ, Philadelphia.—I propose spending the four, or possibly five months, near North Conway, N. H. Please let me know what sport there is, if any, in that neighborhood: also, if it would be worth my while to take my Winchester along? If there is no sport, please tell me of a place no farther away which will combine society for the wife, coolness for the baby, and sport for the papa. Ans. There is plenty of fishing in lake and stream in the vicinity of North Conway, which is one of the attractive points in the White Mountains. There are fine hotels, and over twenty boarding houses in the vicinity, and papa, wife and baby can take their choice. There is no summer shooting, except for woodcock, and of course no use for rifle.

AMATEUR, Latrobe.—Which is the most complete, the most reliable; and the most practicable book on breaking? I have a pup to break, and want to do this business systematically. What is the price of Mr. Burges' book? 2. I want to get my gun "moderately choke-bored." Do you know anything of Bowen's or Johnston's reputation (Pittsburgh firms), and which would you advise me to patronize? Ans. The price of Mr. Burges' book is $4. It will give you instructions as to breaking. "Dinks, Mayhew & Hutchinson" is also an excellent work, as it treats of diseases as well; price $3. 2. We do not know the firms you mention, any good workman should be able to choke bore your gun. In this city they guarantee a certain pattern.

E. S. F., Wesleyan University, Conn.—1. When does the shad rise to the fly, and what fly does one need? I should like also to know whether in such a river as the Connecticut you would fish in the main stream, or in inlets? 2. Also where in Vermont, or in some neighboring section, can I find good trout fishing during the months of summer? Will the fish rise better to the fly in the early part of July or the early part of September? Ans. 1. Shad take the fly in the Connecticut River up to about the middle of June. They are caught about the rapids in the main river, notably below the Holyoke Dam. A brown or gray fly, or combinations of these colors are used. 3. Good trout fishing and splendid accommodation near Manchester, Vt. 3. Trout will take fly better in early September than in July, as they then gather to spawn. June is the trouting month par excellence.

C. T. S., Philadelphia.—I have a gun 10-gauge, 32 inch laminated steel barrels, 8 pounds 4 ounces, muzzle-loader, made by Robert Jones, No. 3 Great Howard street, Liverpool. With 2½ drachms (flask measure, English) Hazzard's No. 1 Dashing Powder at 40 yards, 1¼ ounce No. 6 shot, it put in 284 to 325 pellets in (both barrels) a 30 inch circle. I have never heard the makers name before and would like your opinion. I notice in the FOREST AND STREAM that 4 drachms is a proper charge for an 8 pound gun. Does that mean by weight, (avoirdupois) or flask measure? Ans. Robert Jones, of Liverpool, is a reliable gun maker, but we think that 3 drachms of powder (flask measure) and 1¼ ounce of shot would be the proper load for your gun. The 4 drachms of powder recommended for 8 pound breech-loader, means flask measure, 4 drachms avoirdupois, with a load of shot, would probably burst the gun.

SENEX, Conn.—Can you describe how a "Petit pad" for targetting is constructed; also which is the simplest and cheapest way of making a target of paper for the exhibition of both pattern and penetration? Again, where the weights of powder and shot for a charge are given, does it indicate actual scale weight, or weight by measure? Equal weights of large and small shot do not occupy the same space, even in powder the extremes in grain size differ in bulk. Ans. The Petit pad cannot be had in this country. The best substitute is stiff hardware paper; of this, 30 sheets would be good penetration, and have them large enough to admit of a 30 inch circle being drawn from the centre. The charges as marked on a powder measure represent a measure which is arbitrary, although corresponding with a certain number of grains (both scales) weight. The shot is marked by actual weight avoirdupois.

FOREST AND STREAM.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, MAY 25, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that beautiful in Nature. It will pander to no depraved tastes, nor pervert he legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, May 25th.—Centennial Billiard Tournament at Philadelphia. Rifle Club Shoot: Scranton, Pa., N. R. A., at Creedmoor. Trotting: at Point Breeze Park, Philadelphia, and Lancaster, Ohio. State Sportsmen's Convention, at Geneseo. Base Ball: Chicago vs. Hartford, at Hartford; St. Louis vs. Mutual, at Brooklyn; Louisville vs. Athletic, at Philadelphia; Cincinnati vs. Boston, at Boston; Alaska vs. Mutual, at Hoboken; Lowell vs. Resolute, at Portland, Me.; St. Cloud vs. Osceola, at Orange, N. J.

FRIDAY, May 26th.—Centennial Tournament, Philadelphia. Trotting: at Point Breeze Park, Philadelphia, and Lancaster, Ohio. Convention at Geneseo. Base Ball: Brooklyn vs. Chelsea, at Brooklyn, Chatham vs. Olympic, at Hoboken; Lowell vs. Androscoggin, at Lewiston, Me.; Maple Leaf of Guelph, Ont., vs. Mutual, at Jackson, Mich. Creedmoor.

SATURDAY, May 27th.—Centennial Billiard Tournament, at Philadelphia. Quincy Yacht Club Regatta, Quincy, Mass. Trotting: at Lancaster, Ohio. Convention at Geneseo. Cricket: St. George vs. Philadelphia, at Hoboken. Base Ball: Chicago vs. Hartford, at Hartford; St. Louis vs. Mutual, at Brooklyn; Louisville vs. Athletic, at Philadelphia; Cincinnati vs. Boston, at Boston; Nameless vs. Alaska, at Brooklyn; St. Cloud vs. Stevens' Institute, Hoboken; Lowell vs. Bates' College, Lewiston, Me.; Athletic vs. Philadelphia, at Philadelphia. Creedmoor.

MONDAY, May 29th.—Rifle Shooting: Schuetzen Park, Union Hill, New Jersey. Base Ball: Athletic vs. Philadelphia, at Philadelphia.

TUESDAY, May 30th.—N. Y. Athletic Club: Mott Haven. Rifle: Schutzen Park, Union Hill. Opening Cruise Atlantic Yacht Club, of Brooklyn. Trotting: at Lincoln, Nebraska; Le Roy, New York; Madison, Indiana; Freeport, Ill.; Amboy Park, Pa., and Belmont Park, Philadelphia. Perth Amboy Yacht Club Regatta. Base Ball: Chelsea vs. Olympic, at Paterson, N. J.; Harvard vs. Live Oak, at Lynn; Alaska vs. Chatham, at Hoboken; Arlington vs. Resolute, at Elizabeth, N. J.; St. Cloud vs. Staten Island.

WEDNESDAY, May 31st.—Illinois State Fish Association, at Peoria. Rifle: Schuetzen Park, Union Hill, New Jersey; Rifle Competition for place on International Team. Derby Day, England. Trotting at places as above. Toronto Rowing Club Boat Race.

—Everybody going to the Centennial Exhibition should provide themselves with a railway guide for the journey. The best one to purchase is either the Traveler's Official Guide, containing all the through time-tables and list of railway officers, sold at 50 cents per copy, or the pocket edition of the same, called Official Time-Tables, price 25 cents. With the last named they can ascertain the population of all the cities they pass through, and their principal business interests, etc. It also contains a fine lithographic map of Philadelphia, showing the Centennial buildings. Both are issued by the National Railway Publication Company, Philadelphia.

THE STATE CONVENTION.

THIS Convention is now in progress. There is a large attendance, and the Sporting Press is well represented, H. Busby of *Turf, Field and Farm*, Banks of *Rod and Gun*, Rowe of Chicago *Field*, and Tilestou of FOREST AND STREAM, being present. The number of pigeons provided is 12,000, which will give the competitors sport enough.

The business meeting was held on Monday, of which a full report will appear in our next issue. As we go to press early on Wednesday morning, although our paper is nominally published on Thursday, we can give only the following brief report, telegraphed to us by our representative:—

In the State Pigeon Shoot on Tuesday there were 98 entries, 10 single birds each. Pope's side scored 334 and Manning's side 340—a close scratch. Mr. Wagstaff, delegate from the New York City Society for the Protection of Game, was the first to kill 10 birds straight. In the Amateur match there were 116 entries.

The pistol shooting contest was deferred. In the short distance rifle shooting Dr. C. E. Rider, of the Monroe Club, won the first prize; J. M. Brown, of the Monroe Club, second, and M. Forsyth, of the Geneseo Club, third.

Our report is up to Wednesday morning.

PARADISE REGAINED.—One of the Acts passed by the late Legislature and signed by the Governor, incorporates a Mountaiu and Lake Villa Park Association, which proposes to secure not less than 20,000 acres in the heart of our great northern wilderness, embracing some of the most beautiful lakes and forest hunting grounds, wherein fish and game are to be propagated and preserved. The nominal capital is $200,000, in 1,000 shares of $200 each, and no subscription to be received of less than five shares. Not more than ten per cent. to be called in the first year, and the remainder only as wanted for improvement or the purchase of additional lands. Property already secured for the use of the Company includes a large hotel, saw mill and 1,000 acres of land, partly wild and partly improved.

Two hundred lots of four acres each, and embracing a handsome water front, to be laid out. Each member to have one, and to improve it as he may please. Choice of lots to be determined by the highest bid. Hatching-houses and ponds to be erected this year. Next winter a steam yacht to be taken in, which will have an extent of lake and river navigation of twelve miles. A good road to be constructed as soon as practicable, so that the park will not be more than twenty-seven miles distant from railroad facilities. The Act confers ample powers, is clear, concise, symmetrical and carefully framed to prevent abuse of its provisions for objects foreign to its purpose, and the scheme is to be pushed with energy. The Corporators named in the Act are:—

A. B. Lamberton, Rochester; C. C. Morse, Rochester; James W. Wadsworth, Livingston County; James Faulkner, Jr., Livingston County; Charles N. Ross, Auburn; R. M. Richardson, Syracuse; Thomas McCarthy, Syracuse; R. U. Sherman, Oneida County; Walter Ballou, Oneida County; H. H. Thompson, New York; James L. Jackson, New York. H. H. T.

CALIFORNIA.—In the target practice of the Sumner Guard under Capt. Burns, at Alameda, May 13th, the largest company score on record was made, 67¼ per cent. of the highest possible number of points being tallied. The distance was 200 yards. The company consisted of 52 members, and five rounds were fired. T. E. Carson led off with a score of 22 out of a possible 25, and was followed by Capt. Burns with a 22. There were three scores of 21; five of 20; six of 19; ten of 18; and the lowest of all was 7. The *Alta California* says:—

"The scores, which will be found below in detail, are so far beyond anything heretofore published as having been made at 200 yards' distance, that we have taken some pains to compare them with the record of the Oswego Company, which won the Nevada Badge presented by Gen. Batterman. That company presented themselves at the target with the minimum number of men (46) allowed by the New York law, and made 66⅔ per cent. at the 200 yards distances; the Sumners made 876 out of the 1,300 possibility, and gained the brilliant credit of 67 4 13 per cent. The shots are classed as: 27 bull's-eyes; 114 centres; 76 inners; 31 outers; 12 misses. The percentage of hits on the target is 95. Forty-four men hit the target five times; four hit four times; four hit three times. The credit for the best centre shot was won by M. A. Batea, the bullet striking three-quarters of an inch from the exact centre; W. F. Kellet made a similar success—a tie—but lost his advantage in shooting off. The Oswego Company made only 22 bull's eyes against the 27 made by the Sumners, and the Oswegoans are charged with 22 misses, while the Sumners get only 12 duck eggs."

BLOOMING GROVE PARK.—This delightful summer resort offers special attractions to visitors. The club house is now open, under the charge of Matt, who superintended last year. Members and their guests will find him ready to give them a hospitable reception. The elks and deer in the breeding parks are doing well. Excursion tickets may be had at the Erie R. R office, 401 Broadway.

—Our correspondent F. A. Ober (Fred Beverly), of Fernandina, Fla., has sent us several photographs of the canoe in which Mr. N. H. Bishop completed his recent remarkable voyage, and a very good likeness of Mr. Bishop himself, which we shall soon publish. Most of these views were taken on the St. Marys River, but one, a sunset view from High Point, Cumberland, is a very fine artistic work. Mr. Ober will supply the portrait and three views of the canoe for $1. His address is at Fernandina.

THE WILD HORSE OF AMERICA.

BY JAMES S. BAILEY, A. M., M. D.

ON the boundless plains of Texas, where habitations are few and scattering, wild horses roam in numbers. Their original progenitors are unknown, but are supposed to have been bred in Central Asia, and from thence distributed to other parts of the globe. In form and disposition they resemble domesticated horses, though they often differ in color, many being piebald, mouse color, or dun, besides the intermediate shades of black, bay, sorrel, and gray. These unusual colors are attributable to promiscuous breeding.

In the domestic horses of the present day the high points are the result of culture. Thoroughbred horses, if allowed to run wild on the plains, soon degenerate into the mustang. Wild horses range in herds varying in numbers from a score to many hundreds, each herd being under the guardianship of a single leader, who disciplines his troops in a wonderful manner. The leader holds his position by right of conquest, and loses his chieftainship if vanquished by one more powerful. The young males, on arriving at an age when they show a spirit of gallantry, are always excluded from the herd, unless by strategem each one can induce some mares to join him; otherwise they are forced to lead a solitary life. It is quite exciting to witness a contest for superiority among stallions. The leader, when endeavoring to drive a young horse from his herd, often finds his match, and is frequently conquered instead of being a conqueror. When such a battle takes place each contestant goes boldly to the front of the herd, striking fiercely at each other with their fore feet, and with their teeth hitting and holding on with the tenacity of a bulldog, tearing the flesh from each other. The young stallion may whirl quickly and kick his adversary, but the old horse never stoops to this effeminate mode of combat. Should either one prove victorious the remainder of the herd are willing subjects to his discipline, while the vanquished is forced to seek other company. The leader of the herd can be readily distinguished at some distance by the peculiar toss of his head. When alarmed he is the first to give the signal for a stampede, and is the last to retreat, always remaining between his charge and danger. When quietly grazing he is ever on the watch for intruders, but when the herd is in motion he is always foremost. His faculty for concentrating the herd when members are inclined to straggle is remarkable, rushing at them with open mouth, admonishing them to join their companions or suffer a cruel incision from his teeth. This jealous watchfulness keeps herds from mingling.

The mustang is strong and capable of great endurance as a saddle horse. When examined with the eye of a connoisseur many points are observed quite equal to the thoroughbred; the limbs are exquisitely turned, flat, clean, and sinewy, with ample chest, widely distended nostrils, and with brilliant and protruding eyes. The majority of them have heads and necks finely proportioned; the peculiar leanness about the flank, which may detract from their beauty, gives them speed and endurance. No animal dares to face a herd of wild horses. The carnivora fare badly when the united strength of the herd are brought to bear, as it sometimes happens when an enfeebled member is attacked. Domesticated horses are sometimes enticed among a herd. Many years ago a symmetrical stallion of powerful build by some means escaped domestication and joined a herd of wild mustangs. His exact history was never known, but it was supposed that he escaped from a vessel wrecked on the coast of Texas and swam ashore. Many a herdsman coveted the possession of this beautiful creature. The united efforts of relays of the fleetest and most enduring horses were frequently brought into requisition, but his speed and endurance as often proved a match for them. At length he was shot, and upon his neck were found seven different lassoes which had proved too brittle to hold his agile form. Within his range are found many of his foal; one, a powerful stallion, though broken to the halter, no skilled horseman could remain on his back and endure his tremendous struggles to relieve himself from restraint, having the wild disposition and spirit of his sire.

Many of the finest horses in the State owe their pedigree to "Wild Bill." The facile pencil of Van Zandt portrays the highest points of his beauty and development. His color was a deep mahogany bay, with black points, with thick flowing tail and mane; his majestic carriage gave grace and elegance to every movement. Herdsmen sometimes secrete themselves and dash upon a bunch of mustangs, and by dexterous manœuvers cut off sucking colts from the herd, and in the confusion detain them a moment, when the dams disappear with the rapidity of lightning. The colts then take kindly to their newly-made friends and follow them to the corral. In this way many valuable animals are procured. The writer once possessed two of these animals, which were not only models of symmetry and beauty, but were hardy and enduring horses. One was taken when but a few days old and reared from the bottle. He was diminutive, but symmetrical in form, and his steel roan coating always shone with glossiness. His ambling pace enabled him to go in considerable less than a three minute gait. When mounted by a lad suited in weight to his small size, it only aroused the inherited disposition to indulge in "pitching," which he was sure to practice with success, especially when his rider was a stranger. "Mike" was the admiration of all; although a household pet and constant companion of the juveniles,

any a torn and dusty jacket attested his whimsical ities.

There are several methods practiced in capturing wild ustangs, *viz:* snaring, lassoing, creasing, and walking em down. Snaring is only practiced by Mexicans alled Greasers), who are too indolent to resort to other eans. The place where mustangs drink must first be ascertained. Their watering places in dry prairies are few d far apart. A herd of mustangs will often graze in the cinity, and drink from the same waters for weeks at a ne, if unmolested. Their trail leading to water is usuy inclosed on both sides by thick chapparal, with only e passage. Several lassos are suspended over limbs of ees, with one end securely tied and the noose opened. hen the herd traverse the trail the Greasers, who have eviously remained unseen, expose themselves to view, d by shouting at the top of their voices, so frighten e herd that they gallop headlong through the narrow pasge. A few are caught by the neck, which pitch and ruggle until choked to the ground exhausted, when they e liberated, but not before being saddled and mounted by eir captors, who cling to them with the tenacity of life, d do not yield their places in the saddle until the anials are thoroughly subdued. In using the lasso it is rown with precision to a distance of thirty feet, and is a rtain snare in practiced hands. The lasso is very simple constructions, being made from rawhide, carefully plait- or a rope twisted from the mane and tail of horses, or anilla rope made thoroughly pliant. In either case the rist is furnished with a loop or iron ring at one end, and e other is fastened to the saddle. When not in use it is spended in coils upon the horn of the saddle; but when e animal is in view which is to be secured, the coil is rown over the left arm, the slip-noose or ring is grasped nly with the right hand ready for action. By swinging is four or five feet in diameter around the head the eight of the loop and ring gives an impetus to it, and the nter is enabled to hurl it to its full length with certain m. The size of the loop must be accommodated to the stance of the object, for the noose contracts as it travels rough the air, and if made too small it fails to encircle e animal's neck.

The mustang when captured is savage and furious with scomfiture, and would speedily escape were not the rider's rse trained to assist in the manœuver; for he comeheuds as well as the rider, when the aim is unerriug, d suddenly checks his speed, and throws himself upon s haunches so that when the rope is spent the weight of e captured horse throws it prostrate, which is strangled the encircling noose and reduced into subjection. hile the captured horse is gasping for breath the hunter smounts, one end of the lariat being securely tied to his ddle. He secures the rope, and glides along the lasso ith cautious advance until within a few feet of the wild ute, tightening the encircling rope when the animal tries escape, and relaxing it slightly when the creature subits. In a short time he is enabled to seize the horse by e head and mount it.

As soon as the mustang learns subjection, and that he kindly treated, he is overcome, and can scarcely be disguished from a thoroughly domesticated animal. Creasg is mostly practiced by hunters who become dismounted d are in need of a horse. After sighting a drove of rses they usually crawl towards them, and lie in wait in me secluded place near their trail, and when they come to ter one is singled out, and shot so as to graze the top of e skull just behind the ears. The sudden blow stunning e horse for a few seconds. In this bewildered condition the nter secures him with ropes before consciousness returns. he rifle is never brought into requisition, in creasing, expt by experienced marksmen, for a deviation of half an ch is quite sufficient to miss or kill. If the whole herd to be captured, the best method is to walk them down. his procedure requires four men with one or two led rses each, who are stationed at a watering place in waitg for the arrival of a herd, when two men start in pursuit fore the mustangs have had an opportunity to quench eir thirst. They must start slowly, taking care not to ge them into a run. The sight of the mounted horses sure to keep the mustangs at a safe distance; in this y they are kept moving, but no faster than a walk, so at they cannot eat. Moonlight nights should be selected, that the trail and herd can be discerned through the tall ass. By daybreak twenty or thirty miles may separate e herd from the watering place, and the drove will move ore gently, but still they must not be pressed or they ll flee from pursuit. After changing horses, one of the lers, by flanking the herds may start them on the back ck towards water; being thirsty they readily obey, and hen they arrive they are surprised to see two more men in rsuit, while the first men turn carefully away to wait their rn in pursuit on the following day. Each relief in this y takes their turn, taking care not to force them into a n but pressing them sufficiently to prevent them from ting or drinking. Three or four days and nights, with e exercise and abstinence from food, is usually quite sufient to tire them so that they can be driven to the nearest rral and penned; though a much longer time is necessary some instances for the accomplishment of their capture. The writer in first visiting Texas after traveling into the erior by rail, determined to purchase a saddle horse and ew the country on horseback. In the suburbs of Houn was a cavayard of mustangs which were exceedingly unp and fine looking. The herdsmen were dressed in eksskiu suits; their swarthy complexions and broad brimed sombreros convinced him that they were Indians, but they proved to be Mexicans, disposing of their herd. A stranger approached and informed him of the intractable spirit of these unbroken and pitching mustangs which saved him from much expense and perhaps broken limbs. One was lassoed and saddled for exhibition. After witnessing it pitch the newly formed acquaintance was kindly thanked for his manifested interest, and assured that the steam horse was much preferred to the unruly mustang.

Mexicans when riding an unbroken mustang use the *Bozal* instead of a bridle, which is simply a nose band held in position so that when the horse is inclined to pitch, by drawing on the reins the nose band is drawn tightly over the nostrils, stopping the breadth. Unless the mustang can at each jump or pitch take a full inspiration, their pitching is ineffectual.

Many of the wild horses, when thoroughly broken, show considerable speed. Several years ago a traveling circus company had among the number of horses a domesticated wild horse named Orphan Boy, perhaps on account of his dilapidated and rough appearance, but this same brute astonished many by trotting a mile in less than three minutes. On entering populous towns his owner enjoyed trotting this horse against time for oysters for the company, which he was sure to win.

The wild mustang after being broken and rendered subservient to the will of man, when his freedom is regained, soon returns to his original state. A tribe of Indians captured a wild mustang, and in their rude manner forced him into subjection, and after being exchanged from tribe to tribe he finally escaped, and for a long time baffled all efforts for his recapture. At length he was caught, but broke the cords which bound him and fled to the mountains. In time he again reappeared and plans were laid to take him. He was so fleet that he outdistanced the best horses, and a number were not sufficient to run him down. When surrounded he fought and kicked so fiercely that it was impossible to take him. One day being surprised in a canyon he was lassoed and choked into semi-obedience, but when mounted by a fool-hardy brave, flew like the wind to the mountains. The poor Indian returned a day or two afterwards to his wigwam bruised, sore, and tired, afoot, having been thrown when the animal was again free.

The countenances of men generally disclose their nativity and the complexion the climate in which they were reared; so the hoof of the wild horse is the certain index to the locality in which he is reared. The horses ranging on a flat prairie have hoofs and limbs to correspond; while the mountain mustang has a hoof smaller and more compact, which is better adapted to the wear and tear of climbing the rugged mountain sides. The size of a mountain pony is smaller and more symmetrical, denoting a higher bred animal. The hardy manner in which he is reared, cropping here and there the crisp herbage, also fits him better for hard usage. The climate of the mountain regions being colder causes a profusion of hair to protect him, which is also a distinguishing mark.

THE MUSTANG RACE.—The effort on the part of George Parker to ride 305 miles in fifteen hours, at Fleetwood Park on Thursday, although resulting in a failure, was still a great feat as far as accomplished. Indeed, had it not been for a want of condition in the rider, and most injudicious use of provender, also on his part, the distance, as far as the horses were concerned, could easily have been accomplished. Apple pie, washed down by copious draughts of cold water, would be, we should imagine, the most destructive diet which could have been adopted, and at the close of the 226th mile Parker was so exhausted as to have to be carried from the track. The following table will show the time made at various stages of the ride:—

Miles.	M.	S.	Total H.	Total M.	Total S.	Remounts.
10	27	24		27	24	8

Parker allowed himself ten seconds to change horses, but he really averaged about fifteen seconds, which would make in 181 relays 45m. 15s. That gives the following

SUMMARY.

	H.	M.	S.
Actual time in saddle	10	00	13½
Time occupied in changes		45	15
Rests and other delays		41	31½
Actual time	11	27	00

If Parker had been on time he should have completed 226 miles in 11h. 6m. 53 1-9s., which therefore made him 20m. 6 8-9s. behind when he was obliged to give up.

Parker has since published a card, saying that his diet was of his own choosing, and exonerating every body. He attributes failure to the rain and bad track.

—The Alexandria (Va.) *Gazette* mentions a haul of rock fish (striped bass), made in 1854 off the Freestone Point shore, on the Potomac, sufficient to load three vessels, beside large quantities given away on shore.

The Rifle.

CREEDMOOR.—The fine weather attracted an immense crowd to Creedmoor on Saturday, the contest being for the Geiger Bull's-eye trophy; 15 shots at 800, 900, 1,000 yards, the firing to open at the latter ranger. There were thirty-two entries, General Dakin making the highest score, but tieing with Mr. Farwell on the number of bull's-eyes. The question then arose as to the manner in which the tie should be shot off, Mr. Farwell contending that it should be decided by another shot, and he proceeded to make another bull's-eye to substantiate his claim. The Secretary, however, held the badge until such time as Mr. Geiger decides as to the conditions of his gift. The principal scores were as follows:—

Name.	1,000 Yds.	900 Yds.	800 Yds.	T'ls.	Bull's eyes.
W. B. Farwell	71	65	47	183	26
T. S. Dakin	81	58	50	189	26
L. M. Ballard	75	65	45	185	18

R. Rathbone	61	69	44	174	20
H. Fulton	69	58	47	174	21
A. Anderson	74	51	41	169	19

The Seventh Regiment Rifle Club were out shooting for several badges and trophies at 200 and 500 yards. The "shells" were won by Private Nichols, of the Eighth Company, and Captain Robbins, Rifle Practice Inspector of the regiment, won the Diamond Badge.

CREEDMOOR.—The Seventh Regiment, 155 men; Eighth, 160; and Sixty-ninth, 70, practised at Creedmoor on Monday. Of the brigade staff, Major Wylie scored 40 of the possible 50 points, at 300 and 400 yards; Col. Wentworth, 34; Gen. Varian, 30; and Col. Fleming, 28. Private Godfrey Smith, Company F, Eighth Regiment, had his right leg broken near the ankle. The winners of marksmen's badges were:—

PRIZES OF THE NATIONAL RIFLE ASSOCIATION.—At a meeting of the Executive Committee of the Board of Directors of the N. R. A. held on Friday last, the Prize Committee reported the receipt of a number of prizes which were distributed among the matches as follows: Short range match—first prize, a Martini-Henry Rifle, value $75; second prize, field glass, valued at $18; third prize, cash, $10; three cash prizes of $5. and four cash prizes of $3. each. Military match—first prize, an embroidered flag, value $100; second prize, a wall tent, value $45; third prize, a bronze clock, value $25. Mid-range match—first prize, a telescope, value $70; second prize, a bronze mantel clock, value $34; third prize, cash, $20. Individual match—first prize, a Remington special military rifle, value $75; second prize, a telescope and tripod, value $25, and three cash prizes of $5. and five of $3. each.

GLEN DRAKE.—The opening matches of the spring meeting of the American Rifle Association, after one postponement, were commenced at Glen Drake range, Pelhamville, on Friday last. The first match was open to all comers, at 200 yards distance, the prizes being two silver trophies valued at $25 and $12 respectively. The winning scores were as follows:—

Name.	Score.	Total.
Major Shonnard	4 4 5 4 4	21
A. Gorohman	3 5 4 4 5	21
D. F. Davids	5 4 5 3 4	21

The second contest was a military match, distance 200 yards, off-hand, the best scores being as follows:—

Name.	Score.	Total.
M. Cookspere	4 4 4 4 5	21
Colocel Shonoard	3 4 4 4 4	19
D. F. Davids	4 4 4 3 3	18

The third and last contest was a "subscription" match, in which the prize consisted of a division of one-half the entrance fees between the makers of the three highest scores. The distance covered was 200 yards. Following are the winning scores:—

Name.	Score.	Total.
D. F. Davids	5 4 4 4 4	21
D. F. Davids	4 3 4 5 5	21
Major Shonnard	4 5 3 5 4	21

The principal event on Saturday was the match for the DePeyster badge, valued at $300. The conditions were—seven shots each at 300 yards, off-hand, State rifles. The leading scores were as follows:—

Name.	Score.	Total.
Lieut. Gee, Eighth	3 3 3 4 3 4 3	23
F. Backofen, Forty-seventh	4 5 3 3 0 3 3	21

In the all comers' match seven shots were fired by each man, but those using 50-calibre military rifles were given seven points, placing them entirely ahead of the marksmen having fine sporting rifles. Captain Thompson was the successful shot, scoring 27 out of the possible 35, and counting 34. A few of the best scores were:—

Name.	Score.	Total.
Capt. Geo. H. Thompson	3 4 3 4 4 4 5	27* 34
Lieut. Kunz	0 4 3 4 3 4 4	22* 29
Sergt. Madrico	0 3 3 4 4 3 4	20* 27
Lieut. Gee	0 2 3 0 4 4 4	17* 34

*Seven points allowance.

In a subscription match, carried on in connection with the day's practice, the winners of the moiety of the stakes were:—

Name.	Score.	Total.
Lieut. Kunz, Twenty-seventh Regiment	3 4 4 3 4	18
F. Backofen, Forty-seventh Regiment	4 4 2 4 4	18
D. F. Davids	4 4 2 5 3	18

LONG ISLAND.—The contest for the Champion Badge by the members of the Jamaica Rod and Rifle Association, took place on their range Wednesday afternoon, Col. Wm.

S. Cogswell being the winner. The result is as follows, 200 yards, off hand:—

Name.	Total.	Name.	Total.
Wm. S. Cogswell	41	Elbert N. Remson	35
Chas. J. Steward	40	Geo. A. Hicks	33
Theo. Rogers	39	Stephen Ryder	34
Geo. H. Breed	33	Thos. B. Fish	28
Geo. W. Damon	38	John B. Fleury	24
John M. Crane	36		

This badge will be contested for on the second Wednesday of each month, and become the property of that member who shall have won it three times. There is also a Challenge Badge which is shot for every Saturday afternoon, and becomes the property of the member who shall win it the greatest number of times during the season. At the match last Saturday this badge was won by Alderman Fleming by a score of 28 out of a possible 50.

SARATOGAS AND PARTHIANS.—The return match between the Parthian Rifle Club of this city, and the Saratoga Rifle Club of Saratoga Springs, took place on the 18th inst. at Camp Geiger, near this city. The total scores stood—Parthians, 564; Saratogians, 559, out of a possible 600. The Parthian average was 94. This is said to be the largest average ever made in a 500 yard eon test. Mr. Jerome Pitney, Captain of the Saratoga team, has addressed us the following note.—

NEW YORK, May 20th, 1876.

EDITOR FOREST AND STREAM:—

I desire to call your attention to the fact that we lost the match with the Parthian, Jr. by shooting on the wrong target. Gates' ninth shot was on their target. If it had not been for that we would have won, as one of their team made an outer.

JEROME PITNEY,
Captain Saratoga Team.

ALABAMA.—The First Alabama Regiment met for rifle practice at Mobile on the 12th inst. The target used was the Creedmoor third class, and the distance 100 and 200 yards. Our space permits us to print only the leading scores, which were as follows, five shots being fired per man, with Springfield rifles:—

Name.	100 Yds.	200 Yds.	Total
Mobile Cadets—Holt	23	20	43
Mobile Rifles—Williams	22	21	43
Cleburne Guards—McCann	22	19	41
Gulf City Guards—McAndory	20	18	38
Washington L. Inf.—Williams	21	16	37
German Fusileers—Kleinejon	21	19	40
State Artillery—McAleer	20	17	37

The scores made by teams from various companies were as follows:—

Mobile Rifles	114	91	205
Mobile Cadets	106	92	198
Cleburne Guards	105	83	188
Gulf City Guards	99	80	179
Washington Light Infantry	97	78	175
German Fusileers	92	81	173
State Artillery	93	75	168

WISCONSIN.—The fourth contest at 200 yards for the Brodhead prize was shot at Milwaukee on the 12th inst. The day was a beautiful one—warm, bright, and clear, and should have drawn out more riflemen. One old friend, Sketch, who, owing to pressing business mixed with a general soreness of body and soul, caused on one hand by a backward shooting gun, and on the other by disgust at not being able to learn his "Spitz" to shoot off hand (Milwaukee style) has been absent from the range for several weeks past, put in an appearance; wins the glass once, and feels as if he had something left to live for. The following is the score:—

Name.	Score.	Total.
Sketch	5 4 4 4 4 5 4 4 4	42
Moulter	5 4 4 4 4 3 4 3 5	40
Bangs	3 4 3 4 4 5 5 4 4	40
Williams	4 4 3 4 4 5 4 4 3	38
Yale	4 3 4 3 4 4 4 4 4	38
Fielding	3 4 5 4 3 4 4 5 4 2	38

WAU WAU.

THE WILLETT AND BURGANS MATCH.—*Extraordinary Rifle Shooting.*—Mr. F. P. Le Breton, of the National Guard Shooting Club of San Francisco, has kindly sent us the scores of some remarkable matches recently shot between Messrs. Chas. Burgans and E. H. Willett, of that club, with photographs of the competitors and diagrams of the targets. We say that the shooting is remarkable, for it is really most creditable to the contestants, and at the same time shows a parity of excellence in marksmanship that repeated tests could not determine. The history of the match is this;—On March 13th, in a match between the "Three Charlies"—Burgans, Nash, and Le Breton—on the one side, and Willett, Carson and Hentz on the other, the two principals, as above, made each 164 points, out of a possible 200 points, 40 shots at 200 yards. In a subsequent match, March 26th, 40 shots, same distance. the "Three Charlies" shooting against Messrs Willett, Harris, and Wright, the same gentlemen tied again on 162. This led to the match of April 16th, in which the merits of Messrs. Burgans and Willets should be tested independently, the conditions being 50 shots at 200 yards, for $100 a side, five shots more to decide a tie. The following score shows the results, with ties in each case, and stakes drawn; the wind blowing very strong during the shooting:—

BURGANS		WILLETS.

CONLIN'S GALLERY.—This favorite resort of riflemen was re-opened on Tuesday evening. Mr. Conlin, in his address to his friends, says:—

"The impetus given to shooting in America by the late successes of our national team in the old country, coupled with the desire on my part to fully accommodate the increasing amount of business, has enabled me, through very elaborate and extensive alterations, to extend the capacity of my gallery to at least triple its former dimensions, and I can safely affirm that I now have the most capacious gallery in existence, comprising three separate galleries, with six perfect and distinct ranges."

Mr. Conlin has also one of the finest collections of firearms in the country, and he has made arrangements to have the latest advices from Creedmoor received by telegraph and posted in the gallery.

THE IRISH-AMERICAN RETURN MATCH FOR 1876.—The Amateur Rifle Club, in whose hands have been placed the arrangements for the third match with the Irish Riflemen, to be shot next summer, have issued an address to the Riflemen of America inviting them to compete for places on the American team under the following conditions:—

Competition 1.—Open to all native born citizens of the United States, to take place June 20th and 21st; fifty shots each day by each competitor; fifteen at 800 yards, fifteen at 900 yards, and twenty at 1,000 yards.

Competition 2.—Open to sixteen men making the highest aggregate at the preceding competition, this latter to be shot June 27th and 28th, the distance and number of shots same as foregoing. The twelve men scoring the highest aggregate in the contest will constitute the team and reserve.

Competition 3.—Open only to team and reserve, to take place July 11th and 12th; number of shots, &c., same as in the other two. The aggregate of scores in this and the preceding competition will determine the places of the competitors in order of merit, and the first eight shall constitute the team.

The rifles, sights, targets, position, &c., shall be in accordance with the printed regulations of the National Rifle Association.

No sighting shots will be allowed in any of the above competitions.

Entries must be made by letter to the Secretary, Major Joseph Holland, up to the evening of June 19th, or in person on the range up to ten o'clock A. M., on June 20th. An early notification is requested from those desiring to competc.

HAVERHILL, Mass., May 22d, 1876.

EDITOR FOREST AND STREAM:—

The Mount Washington Rifle Club had their regular shoot Saturday, May 20th. The usual Creedmoor target was used. The following is the score. Distance 200 yards, off-hand; 10 shots:—

Name.	Score.	Total.
M. A. Hill	3 4 3 5 4 3 3 5 4 4	38
J. Manners	4 4 3 3 5 3 4 4 4 3	37

C. A. Kimball	4 3 3 4 4 0 5 4 4 0	33
W. S. Willey	4 3 3 0 3 4 4 3 4 4	32

W. S. WILLEY, Secretary.

The Kennel.

FIELD TRIAL DERBY.

THIS event, held under the auspices of the English Kennel Club was decided on the 4th and 5th inst., at Horseheath, Cambridgeshire. Our English exchanges went to press before the second day's proceedings had been brought to a close, so that we have particulars only of the principal event, the Field Trial Derby for pointers and setter puppies of 1875, the winner to receive £50, the second £20, and the third and fourth £10 each. Of one hundred and two entries a field of fourteen appeared to try conclusions, the puppies being drawn in pairs as at coursing meetings. The first pair put down were Mr. Lort's Glen and Lord Downe's Young Sam, the latter the winner of the puppy stakes a few days before at Shrewsbury. Young Sam won all through in the trial, making three successive points and dropping well to wing. Glen is by the celebrated Ranger, but he had not had the advantage of Armstrong's splendid breaking. In the next trial Mr. Macdonna's Magnet lost by making two false points, Mr Barclay Field's Belmont winning. The next brace were both pointers and a long and uneventful trial followed without either of the dogs distinguishing themselves greatly. Mr. Price's Whim ultimately winning. One of the most interesting trials was that between Lord Downe's Dan (the ultimate winner) by Mr. Llewellin's Sam, and Mr. Bower's Blue Bell III, by Mr. Laverack's Blue Prince. Regarding this trial the *Field* says:—

"Mr. Bower's pretty little mottled Laverack Blue Bell, when down with Lord Downe's Dan, proved unsteady in backing, when her companion found, though she later on stood in perfect form to a single bird, but this was vitiated by a subsequent false point, whilst Dan had gone over the hedge. Armstrong's dog then pegged another lot, and looked like winning the blue ribbon, which might have been gathered by the flower of Chester if better broken. As it was, the judges could but give their verdict in the heat for the white dog."

"In running off the ties pointers were paired with pointers and setters with setters. The final heat between Whim, Mr. Price's pointer bitch, and the last winner (Dan) proved and interesting one, and aroused the energy of the flagging field. Some birds, which had run forward, rose from the bare ground on the top of a hill, and then Whim found splendidly, standing in relief on the brow. We then walked a considerable distance past a hedgerow, where the nightingales were singing divinely, and then Whim cut her own throat by flushing badly a brace of birds she should have found, and as Dan luckily hit off birds twice, he was pronounced the final and absolute winner."

The summary is as follows:—

Viscount Downe's bk. w. d. setter Young Sam, by Llewellin's Sam—Boss, 1 year 2 months, best. Mr. W. Lort's liv. w. d. setter Glen, by Ranger—Cunliffe Brookes's Jewel, 1 year 4 months.

Mr. S. Price's liv. w. b. pointer Whim, by Bang—Biscott's Moll, 1 year 1 month, beat Mr. J. H. Whitehouse's liv. w. d. pointer Bray, by Macgregor—Nina, 1 year 1 months.

Mr. E. Field's bk. w. t. b. setter Belmont, by J. Bishop's Brackley—Bell, 1 year 2 months, beat Mr. G. de La. Macdona's liv. w. b. setter Magnet, by Shirley's Rock—Lily white, 1 year 3 months.

Mr. G. T. Bartram's bk. w. m. d. pointer Special, by Whitehouse's Pex—owner's Romp, 1 year, beat Mr. R. J. Lloyd Price's liv. w. d. pointer Lucky Sixpence, by Drake—Nimble Nine pence, 1 year.

Mr. G. Brewis's w. bk. b. setter Balsham, by Macdona's Ranger—Bishop's Dumpsey, 1 year 3months, beat Mr. H. D. Brandreth's w. liv. b. setter Bessie II., by Shirley's Rock—Lily white, 1 year 3 months.

Mr. E. Bishop's liv. w. d. pointer Roy, by Brighton—Flora, by Drake, 1 year 3 months, beat Mr. G. de L. Macdona's liv. w. b. pointer Min, by Price's Mike—Watt's Mab, 11 months.

Viscount Downe's bk. w. d. setter Dan, by Llewellin's Sam—Flash, 1 year 1 month, beat Mr. T. B. Bowers's bk. w. t. b. setter Blue Belle III., by Laverack's Blue Prince—Dora, 1 year.

II.—Belmont beat Young Sam; Whim beat Special; Whim beat Roy; Dan beat Balsham.

III.—Dan beat Belmont and Whim.

Lord Downe's Dan, (setter), first prize; Mr. S. Price's Whim, (pointer), second prize; Mr. E. Field's Belmont, (setter), third prize; Mr. E. Bishop's Roy, (pointer), fourth prize.

In the Horseheath stakes for all ages, which followed, twenty-two ran, Lord Downe was again successful, winning with Jill, a liv. and wh. pointer b. by Mar's out of Lord Sefton's Ruby. Romp, another pointer, by Chang, was second, and the Laverack setter Blue Bell III, by Blue Prince, out of Cora, third.

A match has been made at Cambridge between Mr. G. de Lardie Macdona and Mr. H. D. Brandreth ou one side, and Mr. S. Price and J. H. Whitehouse on the other, the former gentleman matching five setters against five pointers, £5 each dog and £50 the rubber. The match to come off on the third week in September in Cheshire, the dogs to be fairly shot over on partridges, and the Rev. T. Pearce to be judge; each trial to last two and a half hours.

THE KENTUCKY BENCH SHOW.—The Bench Show of Dogs held by the Kentucky State Sportsmen's Association last week was a very successful affair, the list of entries being not only double that of last year, but the quality of the dogs exhibited was also much superior. The following is a list of the winners in the various classes:—

CLASS 1—Imported English setters or their progeny.
Best dog, Stafford, P. H. Bryson, of Memphis, Tenn; best bitch, Maud, do. Second prize, Blanche, J. M. Taylor, Lexington, Ky.

CLASS 2—Imported red Irish or their progeny.
Best dog, Ruby, R. O. Greenwood, Cincinnati, Ohio; best bitch, Kate, do. Second prize, Kittie, J. H. Bierbower, Maysville, Ky.

CLASS 3—Imported Gordons or their progeny.
Best dog, Mack, James Brennan, Lexington, Ky.; best bitch, Mab, R. A. Thornton, Lexington, Ky.

CLASS 4—Native English setters or their progeny over one year old
Best dog, Carr, Jos. Woolfalk, Lexington, Ky. Second prize, Roy, J. L. Martin, do. Third prize, Jet, A. H. Morgan, do. Best bitch, Jet, Dr. B. W. Dudley, Lexington, Ky. Second prize, Kate, do. Third prize, Minnie, W. D Lyons, do.

CLASS 5—Native Irish setters.
Best dog, Grouse, C. T. Peck, Lexington, Ky. Second prize, Jack, A. H. Morgan, do. Best bitch, Peggy, Col. Whistler, U. S. Army. Second prize, Ruby, E. O. Greenwood, Cincinnati, Ohio.

CLASS 6—Native Gordons.
Best dog, Pat, J. H. Mannen, Maysville, Ky. Second prize, Mack, do. Third prize, Ben Buckner, Hon. J. B Beck, Lexington, Ky. Best bitch, Ray, J. H. Mannen.

CLASS 7—Pointers over 50 pounds weight.
Best dog, Dash, E. O. Greenwood, Cincinnati, Ohio.

CLASS 8—Pointers under 50 pounds weight.
Best dog, Spot, J. H. Mannen, Maysville, Ky. Second prize, Viley, D. Knoble, Lexington, Ky. Third prize, Van, Ben Dinke, do. Best bitch, Fannie, Frank Wooley, do. Second prize, Kate, John Gilbert, do. Third prize, Vic Woodhull, Ben Drake, do.

CLASS 9—Native setters under one year.
Best dog, Lon, J. S. Woolfolt, Lexington, Ky. Second prize, Kansas, J. L. Martin, do. Third prize, Bella, John Gilbert, do.

CLASS 10—Best English setter from imported stock.
Best dog, Maid of Lexington, P. H. Bryson.

CLASS 10½—Irish setter pup, sex not considered.
First prize, Kallif, J. H. Bierbower, Maysville, Ky. Second prize, Katblene, P. H. Bryson, Memphis, Tenn. Third prize, Jessie, E. O. Greenwood, Cincinnati, Ohio.

CLASS 11—Best pointer pup.
Vivey, D. Knoble.

CLASS 12—Best English setter bitch and two pups.
First prize, Maud, P. H. Bryson, Memphis, Tenn.

CLASS 13—Best Irish bitch and two pups.
First prize, Kittie, F. H. Bierbower, Maysville, Ky. Second prize, Kate, E. O. Greenwood, Cincinnati, Ohio.

CLASS 14—Best pointer bitch and two pups.
First prize, Fannie, F. W. Wooley, Lexington, Ky.
Best stock dog and two pups.
First prize, Pat, F. H. Mannen, Maysville, Ky

The following gentlemen were judges on the different classes: P. H. Brysou, D. Bowles, Dr. Sanders, J. H. Mannen, E. O. Greenwood, C. A. Kenney, J. B. Beck, J. H. Bierbower. We had no complaint about the decision of the judges. The shooting tournament was quite a success. J. H. Kerr, of the Nimrod Club, of Bourbon county, Ky., winner of the champion badge, C. Leland, and C. A. Kenney won more prizes than all the other shooters. Lexingtou was again chosen as a place for the next meeting, and the following officers elected: Col. E. F. Clay, President; Col. Frank Waters, 1st Vice, and C. A. Kenney, 2d Vice Presidents; G. B. Bell, Treasurer; J. M. Taylor, Secretary; J. H. Kerr, Fred Bierbower, A. G. Morgan, J. R. Viley, Executive Committee. KY.

—At the sale of setters from Mr. Llewellin's, at Aldridges, London, April 22d, the Birmingham champion prize winner and her sister, Peerless, were purchased for Mr. L. H. Smith, of Strathroy, Canada. Petrel was knocked down at £75 12s. sterling, and we believe is the first Birmingham champion prize winner that has as yet crossed the Atlantic. She will come to Mr. Smith in whelp to Llewellin's great champion dog Dan. Petrel and Peerless are by Llewellin's champion Prince out of Lill II. They will be a grand accession to the Strathroy Kennels.

WARTS IN A DOGS MOUTH.—A correspondent, F. H. R., writes from Boston: "In your May 18th number, I notice an article in relation to 'Warts in a Dogs Mouth.' I had a pointer afflicted with that trouble, how long he had been so I did not know, but on opening his mouth one day, I found it literally covered with them. I administered Homeopathic 'Rhus Tox,' five drops, three or four times a day, and within four days they had entirely disappeared and did not return. I have no doubt your correspondent would find immediate relief for his dog if he should apply this remedy."

—A consignment of a pair of very handsome red Irish puppies, dog and bitch, reached our office last week, being the property of Mr. N. Saltus, and sent to us for delivery. Both are by Plunkett out of Diffendorper's Belle, she by Saltus' Dash, winner of first prize at Watertown, and highly commended in champion class at Springfield, 1876. Their grand dam was Dr. Strachan's Belle, imported from the Duke of Devonshire's kennels.

—Mr. Walter Humphreys, who now has charge of Hamilton Thompson's kennel, writes us that Thompson's red setter Belle has visited Mr. George J. Barmore's Jack, better known, perhaps, as Robinson's Jack.

MANGE.—A correspondent writes from Washington, D. C., that Liq. Sulph Calcium is the best remedy for mange. Three or four applications used twice a day will, he says, cure any case.

—The well-known setter, Sam, better known as Reid's Sam, one of the Laveracks by Old Blue Dash out of Moll, died in Mr. Llewellin's kennel a short time back.

KENNEL PRODUCE.—On the 19th inst. Messrs. Granville P. Hawes and W. M. Tiesdon's bitch, Bonnet Cane (bred by Mr. C. H. Raymond) whelped eight pups, six dogs and two bitches, to Mr. N. Saltus' Dash. Bonnet Canes is by Dick Connolly out of Dinah.

Mr. C. E. Corbin's (of Unci's Falls) orange and white setter bitch Fan, has been served by I. C. Fitchett's black and white setter dog Mack Mac is by Pride of the Border, out of Kitty.

Rational Pastimes.

—:oo:—

CRICKET.

YOUNG AMERICA CRICKET CLUB.—The first elevens of the Young America and Merion cricket clubs played a match at Germantown on Saturday, May 20th. The Merions showed a great improvement on any previous play, and now present a really good eleven. The fielding was good on both sides, but the Young America won with ease, having eight wickets yet to fall, the score standing, Merion 88 and Young America 89.

The Philadelphia will play the Young America on Saturday next, and the Germantown and Young America will probably play on the following Saturday.

No definite arrangements have as yet been made for an international match, but one is almost certain to be held in the fall.

SCULLS.

BASE BALL—THE PROFESSIONAL ARENA.

The advent of the western clubs in the east is the event of the month in base ball circles, and the contests which are to take place in Philadelphia, Brooklyn, Hartford, and Boston every Tuesday Thursday and Saturday from now until June 18th bid fair to be of the most interesting character. The opening games took place on Tuesday, when the Chicagos met the Hartfords, in Hartford; the St. Louis the Mutuals in Brooklyn; the Louisville the Athletics in Philadelphia, and the Cincinnati the Bostons in Boston. Next week a change in the order occurs, when Chicago goes to Boston, St. Louis to Hartford, Cincinnati to Philadelphia, and the Louisvilles come here.

The past week's play saw the Hartford step nearer to the front place than they have done yet. The record up to May 22d is as follows:—

	Athletic.	Boston.	Chicago.	Cincinnati.	Hartford.	Louisville.	Mutual.	St. Louis.	Games won.
Athletic		0	0	0	0	3	0	0	3
Boston	3		0	0	0	0	3	0	6
Chicago	0	0		1	0	4	0	2	10
Cincinnati	0	0	0		0	0	1	0	1
Hartford	0	0	0	3		0	2	3	8
Louisville	0	0	0	3	0		0	1	4
Mutual	1	1	0	0	1	0		0	3
St. Louis	0	0	2	2	0	3	0		7
Games lost	3	5	2	9	1	8	3	5	46

The Athletics' first western tour proved a very unlucky one, it being marked by a succession of defeats after the club left Brooklyn, the New Havens defeating them by a score of 13 to 6; and yet when they got home they defeated the Philadelphia nine by 13 to 1.

Dick McBride donned the "Red Stockings" for the first time in Boston, on May 22d, in a match with the Hartfords. He received quite a welcome. The Athletics made a great mistake in allowing him to leave their club, as they did in letting Clapp go.

The record of model games in the professional arena to May 22d is as follows:—

May 15.—Chicago vs. Louisville, at Chicago.....4 to 3
May 15.—Hartford vs. Athletic, at Hartford.....9 to 2
May 17.—Hartford vs. Boston, at Boston.....8 to 3
May 18.—Louisville vs. Cincinnati, at Louisville 9 to 3
May 19.—St. Louis vs. Chicago, at St. Louis.....4 to 1
May 19.—Resolute vs. Star, at Elizabeth.....5 to 3
May 19.—Brooklyn vs. Chelsea, at Brooklyn..7 to 5
May 19.—Rhode Island vs. Live Oak, at Lynn..4 to 3
May 19.—Neshannock vs. Active, at Newcastle.5 to 1
May 20.—Boston vs. Mutual, at Brooklyn.....7 to 4
May 20.—Chicago vs. St. Louis, at Chicago..6 to 3
May 20.—Louisville vs. Cincinnati, at Louisville.3 to 4
May 20.—Hartford vs. New Haven, at New Haven.6 to 5
May 22.—St. Louis vs. Mutual, at Brooklyn.....12 to 3
May 22.—Chicago vs. Hartford, at Hartford.....3 to 4

THE AMATEUR ARENA.

Some very fine games were played by amateur clubs last week, the most noteworthy being the following, played at Prospect Park, May 20th:—

NASSAU.	R.	1B.	PO.	WINONA.	R.	1B.	PO.
Bruce, 1 b....	0	1	7	Scribner, c....	0	1	4

RUNS SCORED.

Nassau.....0 0 0 2 0 0 0 0 0—2
Winona.....0 0 0 0 1 0 0 0 0—1

Umpire—Mr. Hegeman of the Winona.
Time—One hour and forty minutes.

Among the good games played were also the following:—

May 16.—Nassau vs. Park, at Brooklyn (10 inn), 8 to 7
May 16.—Orchard vs. Favorita, at Brooklyn... 8 to 5

The college games of the week were as follows:—

May 15.—Chicago vs. N. W. University, at Chicago.....9 to 0
May 17.—Taunton vs. Brown University, at Providence.....6 to 4
May 17.—Yale vs. Trinity, at New Haven.....9 to 4
May 17.—Amherst vs. Wellston, at Amherst... 7 to 3
May 18.—Princeton vs. Surr, at Princeton ... 9 to 7
May 20.—Nameless vs. Lafayette College, at Eaton.....10 to 5
May 20.—Bates' College vs. Bowdoin, at Lewiston.....9 to 0
May 20.—Harvard vs. Amherst, at Amherst....12 to 2
May 20.—Yale vs. Princeton, at Princeton.....12 to 9

PHILADELPHIA BILLIARD TOURNAMENT, MAY 23.—Daily 300, Shaw 161; Slosson 300, Foster 231; Rudolph 300, J. Dion 173; Rudolphe 300, C. Dion 98.

—The spring meeting of the Olympic Club of San Francisco took place Saturday the 13th. The weather was cold and disagreeable, and the results, except the 100-yard race and the standing jump, were not up to the mark:—

I—100 Yard Race.—A. Prinz, winner—time, 10s.; A. S. Thompson, second by 1yd.

II—Running High Jump.—M. F. LaGrange, winner—5ft. 3in.; R. C. McMillan, second—4ft 9in.

III—440 Yard Race.—A. S. Thompson, winner—57¼; G. M. Robinson, second; M. C. White, third.

IV—Running Wide Jump.—C. R. Browne, 18ft. 3¼in.; A. Prinz, 18ft. 8¾in.; M. F. LaGrange, 18ft. 9in.

V—Putting Heavy Weight—32lbs.—W. Montagne Kerr, winner—22ft. 10¼in.; W. S. Smith, second—22ft. 1in.

VI—Standing Wide Jump.—W. S. Lawton, winner—12ft. 6¼in.; M. F. LaGrange, 11ft.; A. S. Thompson, 11ft. 10in.; A. Prinz, 11ft. 8¾in.

VII—One Mile Race—G. M. Robinson, winner—5m. 53⅘s.; W. Davidson, second by 3 feet.; C. R. Browne, third.

VIII—Putting Light Weight—16lbs.—W. S. Smith, winner—32ft. 6in.

IX—Three Standing Jumps.—W. S. Lawton, winner—35ft. 9in.; M. F. LaGrange, 35ft. 2¾in.; A. S. Thompson 31ft. 7in.

X—One Mile Walk.—G. M. Robinson winner, 8m. 10⅘s.; J. R. Fulton second, by 30 ft.

XI—Throwing Base Ball.—W. S. Smith winner, 288 ft. 6 in.

XII—Running Hop Step and Jump.—A. Prinz winner, 38 ft. 1 in.; M. F. LaGrange, 38 ft.; A. S. Thompson, 35 ft.

XIII—120 Yard Hurdle Race (10 hurdles, 3 ft. 6 in.)—M. F. LaGrange, 21 seconds.

XIV—Three Mile Race.—W. Davidson winner, 17 min. 54 sec.; G. M. Robinson, second.

PRINCETON ATHLETICS.

PRINCETON, N. J., May 13th, 1876.

EDITOR FOREST AND STREAM:—

The preliminary contest of the Princeton Athletic Association took place May 13th. These games are intended to be a training contest for the regular meeting, which occurs during Commencement week in June. Below is a summary:—

I—Standing long jump, three trials.—F. Larkin, '79, and W. P. Stevenson, '76, tie on 9 feet 7¼ inches. On the Larkin made 9 feet 8¾ inches; Stevenson, 9 feet 8 inches.

II—100 Yard Race.—McCosh, '77, first, Hunt, '78, second. Time 10 seconds.

III—Throwing Base Ball.—Woods, '76, 371 feet 7½ inches; Denny, '77, 370 feet 3½ inches.

IV—One Mile Walk.—Dodge, '79, first; Brown, '76, second. Time, 9 minutes 55 seconds.

V—Putting 24-pound Cannon Ball.—Markoe, '76, 23 feet 6¼ inches; Parmley, '76, 24 feet 8 inches.

VI—Quarter Mile Run.—Chapin,' 76, first; Pharner, '78, second. Time, 1 minute 1 second.

VII—Throwing 16 pound Hammer.—Parmley, '76, 73 feet 1¼ inches; McCosh, '78, 72 feet 2¼ inches.

VIII—Hurdle Race, 100 Yards.—Woods, '76, first; Marquand, '79, second. Time, 20 seconds.

IX—Running Long Jump.—Larkin, '79, 16 feet ¾ inches; Ridgely, '79, 14 feet 5¼ inches.

X—One-half Mile Run.—Pharner,'78, first; Parmley, '76, second. Time, 2 minutes 30 seconds.

XI—Running High Jump.—McCosh, '77, 5 feet 2½ inches.

XII—One Mile Run.—Greene,'78, first; Pharner,'78, second. Time, 5 minutes 11 seconds.

XIII—Three-legged Race.—Brown, '78, (S. S.,) and Dickens, '78, first. Time, 44 seconds.

Judges—George Goldie, A. Marquand, and W. E. D. Scott. Timekeeper—M. Goldie.

It is to be regretted that a great many of our best athletes did not enter these games, preferring to hold back for the intercollegiates. In some of the races there were only two entered.

The University nine began a game with the Philadelphias on Tuesday, but were stopped by rain at the end of the third innings. The score then stood 6 to 4 in favor of the University. LOUNGER.

P. S.—I would like to correct a mistake I made in my report of the gymnastic contest. Kaufman took the prize for general excellence, and Walker that for light weights, instead of *vice versa*, as was there stated. L.

—Samuel Perrine, Jr., Solomon Soper, John Soper, Stephen C. Inman, and Joel Ridgway, attached to Life Saving Station No. 17, Barnegat Inlet, have killed the past season 146 wild geese, 508 brant, and 264 ducks. The largest number killed in one day was 101 head. Considering that only two could be absent at one time, and then not until after sunrise, the capture of 918 head of wild fowl by these parties is a remarkable event.—*Tom's River, Courier, N. J.*

—The Mayor of Philadelphia, on Tuesday, stopped all pool selling in the city. Large sums of money have been paid by New Yorkers to the proprietors of hotels for the privilege of selling pools in them. Budd Doble and Lew. Martin paid $8,000 for the privilege of selling pools in the Continental Hotel.

"PLEASURES OF ANGLING WITH ROD AND REEL FOR SALMON AND TROUT." By Geo. W. Dawson, Editor of the Albany *Journal*, Weed, Parsons & Co., Albany; Sheldon & Co., New York.

This book which we recently announced as forthcoming, is now out and for sale. It is an important addition to American angling literature, and fills in some degree a void long felt as regards salmon fishing in waters on this side of the Atlantic. It contains more information on this subject than all other books together. To those who are content with trout fishing, this is a true Vade Mecum. We shall notice the book at length anon.

..*F. W. Helmick, popular music dealer of 273 West 6th street, Cincinnati, sends us the "Centennial March," by J. Wymond, and the "Mineral Springs Polka," by Gustavus Dolfuss, both seasonable and full of vigor and vivacity.

BLUE FISHING.

KINSEY'S ASHLEY HOUSE, BARNEGAT INLET. DON'T FORGET.—Bluefish annually make their appearance at Barnegat Inlet about May 20th. Parties desirous of being notified by mail or telegraph on the arrival of bluefish, or to secure good yachts, will address J. W. KINSEY, Ashley House, Barnegat, N. J. Access via N. J. Southern Railroad. N. B.—The Ashley House is within 100 yards of the fishing grounds. may11 3t

CANADIAN ORNITHOLOGY.

"Our Birds of Prey."

BY

HENRY G. VENNOR, F. G. S.

THIS BEAUTIFUL AND NOVEL WORK CONtains 30 large Photographed Plates, and upwards of 150 pages of descriptive letter-press. It figures and describes every species of Eagle, Falcon, Hawk, Buzzard, and Owl that is known to occur or occasionally to have visited Canada.

No less than fifteen specifically distinct Falcons and Hawks, three Eagles, and ten Owls are described as inhabiting Canada, some of these, however, being given as "exceedingly rare."

The letter-press of the work is, throughout, based upon the Author's personal observations in the Canadian field between the years 1860 and 1876, and is filled with new and original facts relating to the distribution, habits, and identification of these Birds. It also contains the observations of recent American writers on several species concerning which there has been much controversy.

The whole form a series which it would be difficult to improve upon, and one that is not to be found represented in any one collection in the Dominion of Canada—many of the Birds figured having been sent from distant places on purpose for these plates. All are Canadian Specimens.

The copyright of the whole work has been secured for Canada and the United States by the Author, and only a small edition will at present be issued. This will be distributed in Canada, to Sub-scribers in the order in which their names occur on the Subscription Lists. Early orders are solicited.

Price Complete, in Cloth (30 Plates), - - $15

P. S.—The Plates of this Work will not be sold separately, but if desired the whole book may be had in paper cover, $12.

W. H. HOLABIRD

Would most respectfully announce to his patrons and friends that he is prepared to make

Shooting and Fishing Suits

at the above prices. The ten dollar suit is better made than any competitor can offer for the same money. My original design having been appropriated by other manufacturers, I have been compelled to make many changes in the arrangement of pockets, &c., for which I have to thank the fraternity at large for suggestions. I believe that I have the

BEST SHOOTING AND FISHING COATS IN THE WORLD,

and respectfully solicit your orders. I send my new Illustrated Catalogue, 14 pages, free on application.

Dealers will find it to their advantage to handle my goods. They are better known and more highly esteemed than any other make.

THE "FISHING LINE."

Brook Trout and Grayling Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

The waters of the Grand Traverse Region and the Michigan North Woods are unsurpassed, if equalled, in the great abundance and variety of fish contained.

Brook Trout abound in the streams, and the famous American Grayling is found only in these waters

Brook Trout Season opens May 1st.

Grayling Season opens June 1st.

Black Bass, Pike, Pickerel, and Muscalonge are also found in large numbers in the many lakes and lakelets of this territory. The sportsman can easily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had in many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate is cerlainly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive train facilities offered to tourist- and sportsmen; also on and after July 1st Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, Send to Forest and Stream office, or address

THE SPORTSMEN'S ROUTE,

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago, Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Naomines and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kamesha, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, *via* the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEE E, AND BRANT SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, W. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agt., Chicago.

THE ORVIS REEL.

The Most Compact, Neatest, Cheapest, and Durable Reel in the Market.

NO 1.—This Reel is extra nickel-plated and finely finished. Is perforated to make it light, and keep it free from sand, also that the line may dry without removing it from the reel after use. Has a very perfect click. It is very light, very strong, and holds from 40 to 50 yards of line. It is more compact and less cumbersome than ordinary 30 yard reels. It is quite narrow, and takes up line rapidly. Put up in neat Black Walnut Case, price $5.

NO. 2—For Prizes. Same style as No. 1. Heavy Gold Plate. Extra finish, with case, price $10.

Sent by mail, postage prepaid, on receipt of price, or by express, C. O. D. LIBERAL DISCOUNT TO THE TRADE. Send for Price List of Fishing Rods and Reels. Mention this paper.

McBride Flies,

The Standard Flies for American Waters.

These flies are imitations of American insects, or combination of colors, that an experience of forty years has proved most successful. Parties supplied with casting lines and artificial flies for Pennsylvania trout streams, Adirondacks, the Maine Woods, Lake Superior, Thousand Islands, Canadian, and other waters. Anglers not acquainted with the nomenclature of these flies, by mentioning the locality where they intend fishing, will have the varieties best suited to those waters sent to them. Flies copied from any natural insect or pattern desired. SARA J. McBRIDE, (Successor to John McBride) Mumford, Monroe county, N. Y.

THE NEW

BOSTON
SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

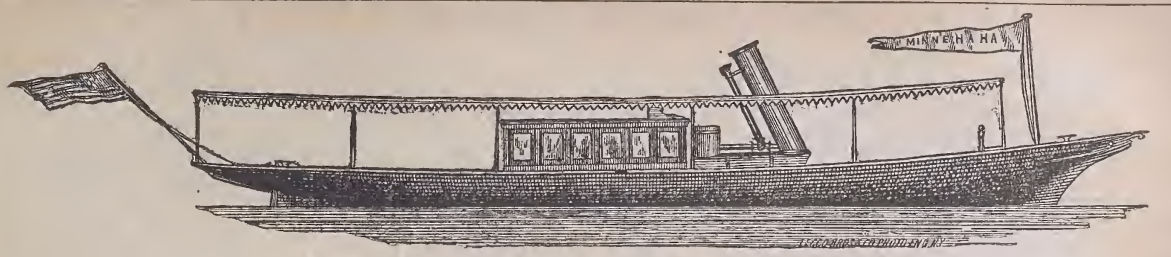
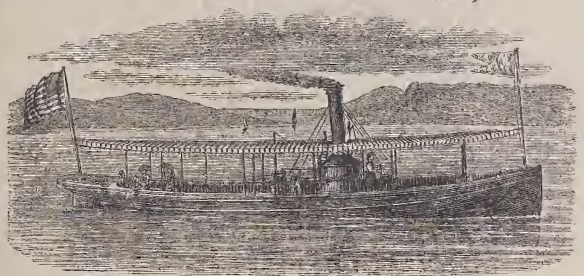
FOR SALE, OR TO LET.



The elegant country residence, WILLOW LAKE, at Locust Valley, near Glen Cove, Long Island.

Suitable for Summer Boarding-House.

The house is 2½ stories, frame, 40 feet front and 32 feet deep, with wide piazza front, rear, and on south end. On first floor are parlors, sitting-room, and dining-room; wide hall through the centre. Up stairs are 9 bed-rooms, all large and airy; kitchen well-arranged and convenient; cellar large and dry.



On the premises, and at a convenient distance from the house, are a stable and carriage house, chicken-house, shed, coal, tool, and ice houses. The grounds are well laid out and tastefully planted with ornamental trees and shrubbery. The avenue leading from the road to the house skirts a beautiful lake, on the border of which the house stands. A Paper Mill at the north end of the lake will be sold with the above, subject to a lease. The lake and land embrace about 37 acres. As a place of residence it is elegant and healthy; for manufacturers it is convenient; for the propagation of trout, for pleasure or profit, there is no better place in the State. Apply to

BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
FREELESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.

For Sportsmen.
A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.
A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.
Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either to steel or iron. These shells are finely finished, and made any length ordered, from 2¼ to 3½ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen- The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,

may15-1y A. H. BOGARDUS.

DESCRIPTIVE GUIDE TO THE

ADIRONDACKS,

AND HAND BOOK OF TRAVEL

To Saratoga Springs, Schroon Lake, Lakes Luzerne, George, and Champlain, the Ausable Chasm, the Thousand Islands, Massena Springs, and Trenton Falls.

By E. R. WALLACE,

Newly Revised Edition.

Handsome 12mo., Flexible Covers, Red and Gold, Maps, etc. Beautifully Illustrated. Over 300 pages. Price, $2.

TESTIMONIALS.

From Hon. J. T. Headley, the Historian, Author of "Adirondack, or Life in the Woods," &c.

It is admirably written and has just enough of humor, sentiment, and description of scenery mixed, to make it delightful. The illustrations are well chosen and very effective, while the instructions respecting routes, localities, distances, outfits, &c., embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—a compliment that I trust will be properly appreciated for its extraordinary disinterestedness.

From Albert B. Street, the Poet, and Author of "Woods and Waters," "The Indian Pass," &c.

I think it is the *best* work on the forest that has appeared—superior in word-painting to Murray's, and full of wood pictures and vivid scenes of camp-life. We realize that we are in the forest, are living with you in the scenes described, and that the trees are waving and the waters flowing over and by us. This, I think, the true test of a good book, impressing its reality and distinctive life on the mind. As a "Guide Book," it is most creditable and valuable. Indeed, it is the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for. It must have cost you intense application and labor. You may well be content that you have produced a good book.

From Benson J. Lossing, the Historian.

I have read those portions descriptive of the places which came under my personal observation, with the deepest interest, and most cheerfully testify to the general accuracy of your pictures as I recall impressions made of them at the dates of my visits. I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wonderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.

Sent by mail on receipt of price, $2.

CHAMPION GUNS OF ENGLAND

PAPE'S

Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun.	Exhibitor.
1st—Grocner	Grocner.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Grocner gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards, Choke Bores.

1st—Pape ..... Davidson

60 yards, Long Range, Sporting Bores.

1st—Pape ..... Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1¼ oz. shot, beat the best 8 bore Grocner gun at 60 yards; weight, 15 lbs.; 6 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1865. Address

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.
aug26-tf Established 1760.

For Close, Hard Shooting,

Convenience, Regularity, and absolute Certainty, use KAY'S IMPROVED SHOT CARTRIDGES.

The perfected cartridges for 10 and 12 gauges are now on the market. jy3 1y

Minnesota Rambles.

"You shall hear the bittern bump and the wild-drake quack."—*Scott.*

AMONG the various summer resorts noticed in your interesting paper I do not recall the numerous lakes around Minneapolis and St. Paul, Minnesota, especially Lake Minnetonka. The praises of Brainerd and its surroundings have been frequently sung, and not unworthily; but that is somewhat out of the range of summer travel. This northwestern section of our country is a famous summer retreat for the residents of the more southern States along the Mississippi; the cities of New Orleans, Vicksburg, Memphis, Cairo, St. Louis, and Keokuk contributing to the number of tourists who visit this region. In Minneapolis, on the east side of the Mississippi, and which was formerly St. Anthony, stands an old hotel, no doubt quite stately in its day, prior to the war, when it was the fashionable resort from the places above mentioned. Here people came to get rid of the oppressive heat of southern climes, and to sail and fish on the many beautiful lakes of the State, the color of whose waters rivals that of the sky above; and to view the birthplace and home of

"Minnehaha, Laughing Water,
Loviest of Dacotah women!"

But the war furnished other occupation for these visitors, and the building now stands a monument of departed greatness, and is used as a school or academy, whose circular remarks that the rooms are large and well ventilated; this latter information being no stretch of veracity.

The Falls of St. Anthony, at this place do not display their natural perfection, owing to the necessity of placing an apron over them to prevent them from committing suicide by undermining themselves and depriving the world not only of their beauty but of their powerful assistance in supplying to it its daily bread. The places of interest for excursions from St. Paul and Minneapolis, the two rival queen cities of the northwest, are Lakes Minnetonka and White Bear, and the Dalles of the St. Croix River. To the first two of these places hundreds of people go in every week of summer weather to enjoy luxurious ease in boating, fishing, or in simply existing without a care or a thought for the morrow, knowing that each day will bring its diversions; and to the latter to view the grandeur (in comparison with the usual level monotony of these Western States) of its rocky fastnesses.

A pleasant ride of an hour from Minneapolis, on the St. Paul and Pacific Railroad, brings one to Wayzata at the foot of that beautiful sheet of water, Lake Minnetonka, dotted with pretty islands and forming deep bays and arms, the delight of sportsmen in search of game, both fish and fowl. At this place are several country hotels with all the requisites for boating and fishing; but those who wish to explore the headwaters should embark on one of the two diminutive steamers which ply to the farthest end of the lake, a distance of eighteen miles. The choice lies between the Sue Gardiner and her younger and more commodious rival, the May Queen. The Sue Gardiner held undisputed sway until the summer of 1874, when the other came into the field and took away the palm. On a pleasant day the former is to be preferred, but it gives no protection in a storm or squall, as the writer found to his sorrow, one day, when his hat went sailing to the leeward and the boat sought the friendly shelter of an island. Opposite Wayzata, about five miles over, is the aspiring town of Excelsior. Here is situated the largest hotel on the lake, at which a good many people come to spend their leisure.

Stopping here a few moments we coast along until we come to an apparently impassible marsh, but nothing daunted the steamer keeps on its way, and after a short struggle with lily pads, reeds, and the danger of getting aground emerges into another arm of this extensive lake. Passing in and out among the islands it comes to Crane Island, where the herons have built their nests for years undisturbed until the advent of the steamers, which have made it one of the inducements of travel to encircle the island on their trips in order to give vandal sportsmen the opportunity of shooting uselessly the harmless birds which inhabit it. In a short time Cook's Lake View House appears in sight, and although the name is inviting, yet a stay long enough to take dinner and view the accommodations is usually sufficient to make most tourists long for the more fashionable quarters at the hotels of the lower lake.

The ardent sportsman, and those who are satisfied with the plainest of fare should stay and enjoy the beauties of nature revealed in this vicinity. The fishing here is very good indeed, and a morning's troll will yield a fine string of pickerel and black bass, the latter weighing from one to six pounds. About a mile from the house is a small pond which will well repay the angler who takes the trouble to have a boat carried over to it.

Cook furnishes very good boats for his guests, and with them one can find endless entertainment in fishing, shooting, and in exploring the numerous bays and navigable marshes; these marshes between the various islands being filled with lily pads and reeds, through which a boat can be pushed without great difficulty, are the favorite retreats of the wild-fowl which abound here both in spring and fall. A great number of wood duck and a few mallards and teal are to be found here at all times during the summer. About the 1st of September the young wood duck afford fine sport. A trip to Crane Island will charm the naturalist. Here he will find the blue heron (*Ardea herodias*), the double-crowned cormorant (*Graculus dilophus,*) and the turkey buzzard (*Cathartes aura*). Eight or more nests of the two former may often be counted in one tree. Woodcock may he met with now and then. Loons are abundant, and with their demoniacal laugh bid defiance to those who vainly strive to capture them. That most beautiful and graceful of our species of birds of prey, the swallow-tailed kite, (*Nauclerus forficatus*) can be seen here soaring over the woods or gliding along fence rows picking up stray grasshoppers and eating them on the wing. The bird most honored in this Centennial year is quite common, and its eyrics may be seen prominently placed in the wildest and most secluded spots. A party of four, with the writer, undertook to rob one of these eyries. It was the 30th of June, 1874, when we found the nest which, from the appearance of the tree and the ground, covered with the remains of many royal feasts and the bones of several defunct eagles, had evidently been there for years. From the excitement of the parent birds we judged that the young had not yet left the nest, and the study was how to get at it. The tree was long since dead, and the trunk very smooth, without limbs for some distance, but by cutting a smaller tree so that it fell against this, one one of the party was enabled to reach the rather treacherous looking limbs and make his way to the nest, when a new difficulty presented itself—he could not look in. The only remedy was to pull out the bottom, which he proceeded to do. After about ten minutes hard work the nest, the limbs which supported it, and two young birds, fully fledged, came down with a crash. The old birds made no efforts to rescue their progeny, but soared far above, uttering their harsh screams. The young were quite different in temperament. One, the larger, was very savage and resented any approach to familiarity, the other was passive, offering little resistance when taken to the boat. We carried them to camp and tied them to a tree, but during the night one managed to free itself and the next morning was not to be found though we searched every nook and corner for some distance—it having made good use of its powers of locomotion. The other, though not a model of amiability, would eat when offered any fish, and, no doubt, would have become quite tractable, but its subsequent history must be foregone, as we left it at the place of debarcation when our camping tour was over.

Strolling through the woods in any direction one finds ruffed grouse in great numbers. They are very tame, and will allow one to approach quite near before taking flight. The crow is not common here, and very few were seen on this excursion; neither was their larger cousin, the raven, observed, although there is no doubt but that he sometimes puts in an appearance. I hope my non-ornithological readers will pardon this digression in favor of a hobby; not *Falco subbuteo* of Great Britain.

A row of about two miles from Cook's, to the head of a small bay, will bring one to a marsh at the foot of a bluff; passing through this marsh one comes out upon another lake, or Goibel's Bay) as it is called. Here can be seen the American representative (*Nelumbium luteum*) of that symbol of ease and bliss—the Lotus. Its large petiate leaves and fragrant, cream yellow blossoms, supported on their upright stalks, attract the attention of all at once. Though it bears an edible fruit, yet it is to be doubted whether the catiug of it would entirely overcome the desire for adventure or travel without the aid of an enervating climate and tropical sun.

One realizes in such excursions that pleasure, even in its happiest vein, must have its drawbacks. In civilization, continued indulgence produces *ennui*, but in nature, it brings health, strength, and ambition, though its frequent associates, the mosquito, the black fly, and a leaky tent on a rainy day, take away the very essence of patience from those who would enjoy a woodland sojourn. The writer, with a party of friends, attempted camping out near the entrance from the lower lake. We had rowed from Excelsior, one afternoon, and pitched our camp here, it being nearly dark when we arrived, and *would* we could have treated the mosquitoes as we did the camp! Tar and oil were manna to them. They came by thousands. We tried a smudge fire, which forced us to retreat with our enemies. We endured it for three nights, but on the fourth we enjoyed a comfortable rest in Minneapolis. This was in June; later in the season this vast army returns to the place from whence it came—the land of shadows.

FRANKLIN BENNER.

HOW INDIANS FISH IN CALIFORNIA.

Editor Forest and Stream:—

While on the headwaters of the Sacramento River last year, I had several opportunities of seeing the Indians catch the salmon, which serves them for food during the winter, and in fact during the whole year. The Indians not being subject to the prohibition of the game laws, are allowed to take game at any season of the year, and they take the salmon when they are in the river to spawn, at which time they come in in immense numbers. The Indians take them by means of spears, one of which I measured, and found it only a few inches short of twenty-five feet in length, and the *modus operandi* is as follows:—

The Sacramento near its head is very swift, and in its passage across different ledges of various degrees of softness it excavates large pools or holes in its bed, each having a small fall at its head and a rapid beyond. The water in these holes, which are often very large, is comparatively still, and they make welcome resting places for the tired salmon, before they attempt the passage of the rapid above; they collect in them in great numbers, the water is beautifully cold and clear, and the fish can be seen crowded together on the bottom. The Indians repair to one of these holes to the number of twenty or more, and a fine picture they make as they stand in position to strike when the word is given, nearly naked, with their brown skin shining, and eyes glittering in anticipation of the sport. Some station themselves at the rapids above and below the hole; others wade out to an isolated rock, or a log projecting into the stream. All hold their spears in readiness, and at a grunt from the leader they commence business. At the first onslaught all generally manage to secure a fish, which is detached from the spear and thrown on the bank, the spears, by-the-way, having barbs of steel, which become detached from the stock when they enter the fish, and being attached to the shaft by cords, turn flat against the fish's side, and make escape impossible when the salmon is pierced through. The Indians proceed silently with their work, and secure a great many fish before they escape from the hole. Sometimes three or four hundred are thus speared out of one pool. They are very cautious about making their preparations so as not to frighten the fish till all are ready, and then to confuse them by a sudden onslaught. The fish are split open and dried in the sun on the bushes, which present a curious appearance all hung with the bright red flesh; they are then slightly smoked and reduced to small flakes, and laid away for future use. The roes also of the "mahalies," as they call the

females, are carefully saved and dried, and are considered a great delicacy by the Indians; but I never heard of white men eating them, although I should think that if cooked while fresh they would be quite palatable.

The trout fishing of this region was also said by some English lords who were fishing there to be superior to anything they had ever seen, each fly on a flight of six being taken in one lake as soon as they touched the water; and these are not lake trout, mind you, but brook trout, or rather river trout, who enter the lake through a stream connected with the river. The Dolly Varden trout, as it is called, on account of the large red spots along its sides, is also found in the McCloud River, but I believe in no other stream. This fish has been until lately unknown to all but the old hunters of the region, and is certainly the gamest fish I ever saw, salmon not excepted. It weighs from four to eight pounds, and when hooked takes the hook between its teeth, like a horse seizing the bit, and makes a rush of sometimes eighty yards in a straight course, continuing these spurts until exhausted. They seem to be all of large size, and are inclined to be cannibalistic. PACIFICUS.

For Forest and Stream.

ALLIGATOR HUNTING IN FLORIDA.

FEW persons here who possess a sufficient share of physical endurance and energy to warrant a day's activity in the open air are in the mood to decline an invitation to spend it in a hunt after alligators. The alligator, bear in mind, has no friends. People seem to take supreme delight in worrying him by all manner of expedients. It is one of the principal pastimes of young men who are traveling up and down these Florida rivers and streams to shoot alligators, and in prosecuting this amusement they will keep up a constant fusilade, to the great annoyance of sober travelers. Not that the alligator is a wicked, dangerous creature. On the contrary, he is timid and harmless, except when his life is imperilled and desperate measures are necessary for its protection. He is as wild and wary as the wild animals of the forest, and shuns the presence of a human being at all times and under all circumstances. He has never been known to attack a white person; but he has tremendous power, and it is not safe to come to close quarters with those that have attained any considerable size. I know it is asserted that these creatures have a strong appetite for the negro. It is a well-established fact that the colored people entertain great fears of them, but I put no faith in the statement that an alligator prefers as food the thick-skinned, odoriferous African to the thin-skinned, sweet-scented Caucasian. He might swallow a new born colored infant, if perchance the child were left unguarded; but I have no hesitation in believing that a white child, under like circumstances, would be equally exposed to danger. Such being the low estimation in which these creatures are held, and the fact that the hunting of them is by no means a perilous amusement, sojourners here are generally quick to accept of any opportunity that may present itself for experiencing the sensations of an alligator hunt, conducted in the usual manner of those experienced in such warfare.

Yesterday, having been urged to go on one of these expeditions, I determined to accept the offer. The party consisted of four persons—Capt. H., of Remington Park; a young gentleman from the Dominion of Canada; Judge S., of Buffalo, and myself. Black Creek was our objective point. The day was bright, and the temperature about 70°. On entering the stream, which is between two and three hundred feet broad, with a depth of from twenty to sixty feet, Capt. H. and his Canadian friend stationed themselves in the bow, one having a rifle and the other a shot gun. The Judge took the oars and I the helm. I also had brought along my fowling piece, together with a trolling spoon, having been told that the creek was frequented by the black and sea trout. In passing up the creek the sail occasionally did good service for us, as we could make long stretches without being forced to use the oars. We chose the sunny side of the stream, knowing that our game would be more likely to be found in the sunshine than in the shade. Alligators enjoy sun-bathing as keenly as the turtle, and are often seen perched upon a floating tree-top, or reclining upon the sandy margin of the shore. Our progress was purposely slow, and as noiseless as possible. The stream, like all Florida streams, is sluggish, with a scarcely perceptible current. Our vision was bounded by the sky overhead, the stream beneath, and the walls of foliage on either hand. The dense luxuriance of the forest was impenetrable to the eye. The stream is fringed on both banks by water lilies and the wild lettuce. The timber is principally composed of ash, maple, gum, bay, oak, pine, and magnolia. I discovered only one oleander bush, but presume there were doubtless many more. Of flowers, none were seen, except here and there a lily and a cluster of azaleas, here called honeysuckle. But one habitation, and that occupied by a colored man, is in view from the boat; but as far as we ascended, the banks are low and offer no inducements to settlers.

At length, after ascending the stream about two miles, the body of one of these creatures was discovered in the net work of vegetation which line the banks. The boat being under sail at that opportune moment, I was enabled without creating any noise to so direct our course as to bring the guns within easy range of the coveted prize. We had approached within twenty or thirty feet before the shots were fired. They undoubtedly took effect, and would have been fatal but for the fact that the creature was already lifeless, and lay there decaying in the sun! This discovery detracted somewhat from the glory of our hunters, but they bore the mortification with philosophical equanimity. We had proceeded only a little distance before the noise of an alligator's movements was heard close at hand. This time, however, the creature was entirely hidden from view by the thick undergrowth on shore. Cautiously and silently we approached the spot, circling into a secluded nook that offered an inviting retreat for the scaly reptile. The search was thorough, but fruitless; the alligator had somehow got an inkling of our approach and put himself out of harm's way. Thinking, however, that he might rise to the surface of the water in case no disturbance was made by us, we patiently awaited his appearance. But nothing came of our expectations, and we finally pushed on again. It was now considerably past meridian, and as the most favorable part of the day had passed, we entertained slight hopes of capturing any of the coveted game; I therefore resolved to try the trolling spoon, and was soon rewarded. While the boat was under sail and passing a small island I struck what was at first supposed to be a snag at the bottom of the stream. The water was deep, and I hauled in the line at the risk of its breaking. This movement was hardly begun, however, before the fish I had hooked rose completely out of the water, and then went down with a swirl. I did not obtain a fair view of it, and was afraid that a gar fish had been meddling with the tackling. Capt. H. assured me, however, that the luckless fellow was a trout, and this allayed my fears. For the purpose of keeping the fish out of the lilies, I swung the boat into the stream, and hauled away as rapidly as possible. The line was out less than a hundred feet, and I soon had my prize securely in the boat. It proved to be a black trout, or what is so called here in Florida, and weighing exactly six pounds. These black trout are nothing more nor less than the black bass of our northern waters, being equally lively and equally palatable. They are the best game fish in the fresh waters of Florida, and in quality are not exceeded by any other species.

To return to the alligator hunt. Although the search was not formally abandoned until we came in sight of the St. Johns, we encountered no game after the capture of the fish. The day's sport was, therefore, barren of results, so far as the main purpose of the expedition was concerned. I did not attribute the ill luck to any want of strategy on the part of the hunters. On the contrary, it must have been owing to the unexpected absence of the game; and this fact surprised me, for had I not been assured by a writer in "Camp Life in Florida" that Black Creek was "lined with alligators on a sunny day?" If it is so lined, there must have been at this time some very powerful causes operating for the failure to show themselves to our vigilant sportsmen. One reason for their non-appearance on this occasion may no doubt be found in the earliness of the season, as these creatures prefer to bask in the heat of summer, rather than revel in the balmy sunshine of these delicious days.

Alligator hunting is growing less and less successful in Florida as the game diminishes in numbers. From being simply a pastime it has become a regular business, and thousands upon thousands of these creatures are now annually slaughtered for their hides and teeth. The former are converted into leather, and make a valuable commodity, while the teeth are manufactured into various articles of use and ornament. At the rate the alligator family is now disappearing, not many years will elapse before the supply will be wholly exhausted, and the capture of an alligator become an uncommon event in sporting life.

Remington Park, Fla., Feb. 27th, 1876. P. H. A.

SPORTS IN TEXAS—A DUCK HUNT.

MR. PRESON and I had talked of making a trip to a "lake," (pond) in the *Nation*, some ten miles distant, until it seemed to myself that go we must. A day was appointed, a spring wagon procured, and on Saturday morning, very early, we were to be off. Expecting to put in part of the day after quail, we concluded to procure some No. 8 shot, but concluding was all, for the city "was just out." At five next morning we were astir, and found that it took considerable time to gear up, get guns, lunch, &c., into the wagon in the dark, and it was daybreak before all was ready. Mr. B. went along rather as a matter of choice, carrying a rifle for squirrels, if any should come in his way, but didn't propose to trouble himself after them. As we neared Red River, quite a flock of chickens lighted close to us, but no time for chickens, we were after ducks. Arriving at the bluff, Mr. B. got out to walk down, and flushed a bevy of quail, the sight of which brought Carlo tumbling out of the wagon. "Down, Carlo!" "Steady Carlo." Whirr! Bang! "Seek dead here!" "Hi, on!" "Steady, Carlo!" "Bang, bang!" By this time the flock was well scattered, and we were after ducks. Arrived at the river about 8 o'clock and saw good many ducks flying, but the wide sand beach was unfavorable for securing any, and we had started for the pond, and to the pond we must go. Upon looking back after we had crossed the river, quite a large flock of wild turkeys were seen a few hundred yards below where we had entered the river, (which is here about 600 yards wide). Some one proposed going back, but no, we had duck on the brain. (It was well enough, for we never got any on the stomach). Some half mile from the river, and within about a mile of the pond, we came to a settlement, and were informed that we would find no ducks at the pond, as there were some men at work draining the lake off. What a fall was there! After all our anxiety to be thus suddenly thwarted was too bad, but it could not be helped now. The gentlemen told us that there were a good many quail in the bottom and some turkeys. It was now half past eight and getting warm. We unhitched our team; gave them some corn, and started to the river, below the ford; arrived and saw the hundreds of ducks on the bars at the opposite side; while we were looking at them, B. fired at a squirrel in the bottom, and the roar of duck wings sounded something like the first approach of a "Norther." Here we were with our fingers in our mouths; for miles up and down the river the water was all at the opposite side, and a wide sand beach to cross in open view.

After some parley we concluded to turn our attention to quail, which was not very inviting with No. 6 shot. Carlo soon came to a point, and for each barrel a bird was counted. For some time nothing was heard but "Down, Carlo." "Steady Carlo." "Seek dead here." The birds seemed every where, and we were in wild plum bushes, grape vines, and red elms. The day was so warm that the birds would not lie, preferring to run off through the briars and bushes. It was now about 11 o'clock, and we felt considerably like breakfast; went to camp, took our coffee pot and lunch basket to a cold running spring, and found that Mr. W. had been burning off his ground, and there was a large bed of coals hard by the spring. We soon had our coffee on and three quail spitted over the coals. While the birds were cooking we entertained a piece of cold roast beef, such as Texas alone affords off the grass in February. Mr. P. suggested that his English friends would hardly believe it without seeing it.

Mr. W. informed us that several flocks of quail could be found around his field distant about a mile. Dinner (or breakfast, which you please) over, we beat the field thoroughly, found one flock, and got one bird and a hare.

We now recrossed the river, and Mr. P. went for some ducks near the ford; was gone about two hours, killed one quail which fell in the river and was carried under a drift; winged another which escaped. This was on the ground where we saw the turkeys in the morning, but no turkeys now. It was now drawing late and we started home. Observing a large hawk on a cotton wood, we drove around him in a circle until within twenty-five yards of him when Mr. P. fired and brought him down. It was a fine specimen of *Archibutes lagopus*, var. *Sancti Johannis*, and the first one I have ever succeeded in taking. On the way home we flushed another flock of quail and had nice open shooting. At night the bag "panned out" fifteen quail, one dove, one gray squirrel, one fox squirrel, two rabbits, (hares), and one hawk, (rough legged buzzard), but *nary duck*. TEXAS.

VIRGINIA STEEPLE CHASING.

THE WARRENTON RIDING CLUB.—THE GREAT RACE OF MAY 19TH.—THE BEST STEEPLE CHASE EVER RUN IN AMERICA.

IN one of the late issues of the FOREST AND STREAM there was given a brief notice of the Warrenton Riding Club, and as there is doubtless much interest in the North on this subject, I will write an account of the race of the 19th inst., and do my humble part in striving not only to awaken a love of the manly sports in other sections of the country, but also to show the *modus operandi* of the pastime to those who desire to form riding clubs. That such a noble animal as the horse, in all its perfection, should be used by professionals of the turf only as a means of winning, by betting on his powers, is a shame; and that the horse with his long pedigree should be valued only as a means of making money, by a disreputable class of a community of the race course is none the less discreditable to our gentlemen huntsmen and sportsmen of America.

The formation of riding clubs by gentlemen throughout the country will tend greatly to inculcate a love of horse-flesh among them. It will bring them more in sympathy with the horse; it will raise the value of blooded stock in the country; it will be a premium on blood, and a discount upon scrubs that infest our country; it will encourage a love for the noblest pastime on earth, and, in fact, the good and benefit to result from a general formation of riding clubs throughout America could not be estimated, and would simply be incalculable.

Some fifty miles from Washington is Fauquier County, a section of exceeding beauty. Watered by the Rappahannock River, and many other smaller streams, it has a charming diversity of mountains, hills, valleys, meadow, and rolling land, as a general thing rich and fertile; a ride through this region is a pleasure to one fond of beautiful scenery; it is changing, and ever varying of wild nature and thorough cultivation, of mountains and rocks of savage grandeur, of handsome mansion and picturesque farm-house, and lowly cabin; all strike the eye and charm the senses. This county is inhabited by as noble a set of gentlemen as ever swung themselves into saddle—hospitable, kind, and brave, with an enthusiastic love of hounds and horses that nothing could extinguish. It has always been famous for its riders. Turner, Ashby, Randolph, Payne, and many others of war fame came from old Fauquier, and it was from the same place that the famous "Black Horse Cavalry" were recruited. Many of your readers of the Federal army will recollect this county, known to them in war times as Mosby's Confederacy, and many of them in memory will recall the dreary winter's camp on the Rappahannock, the summer's bivouac at Warrenton, and the dashing charge against Stuart at the fords, or fighting "hand to hand" with Mosby's rough riders in the gorges of the Blue Ridge. Yes, the old veterans of both sides will remember them of the deeds done, the actions performed, and exploits achieved which, in history, will yet

"Point a moral and adorn a tale."

The Warrenton Riding Club has some thirty or forty members: Gen. Payne, President; Gen. Bethune, Vice-President; and C. Payne, Secretary. Rather much of one name? Well, yes; but almost every other man you meet in Fauquier County is bound to be named Payne, and the other half sure to be named Marshall. The club all own fine horses. Many of the members are well-to-do Englishmen who have located with us, and who have brought their love of the turf from the old country. The costume consists of white corduroy pants, top boots, jacket, and caps of the rider's own colors and design.

The 19th of May last was the day set for the great steeple chase for the silver punch bowl, and the local political cauldron which is generally fiercely bubbling about this time simmered down into nothing beside the intended race. Men talked and put their "pots" on the favorite, and the women espoused the fortunes of their champion with the same ardor as the coarser sex. About noon every known and conceivable vehicle was on the road to the race course, a few miles outside of Warrenton, and near the Sulphur Springs. Fine carriages drawn by stylish thoroughbreds rattled by filled with the beauty and fashion, whose gay laughter floated on the noonday air; aristocratic old centennial coaches jumbled steadily along with the mud of many counties on their wheels; horsemen were passing by scores, many of them sitting in their saddles with that easy negligent grace that bespoke the old cavalrymen who followed Stuart and Hampton; dilapidated old gigs that looked all the world like Oliver Wendell Holmes' celebrated "One Horse Shay" on the eve of dissolution, creaked dismally as an old rip of a mare stumbled her way onward; Jersey wagons, carts, the farm wagon, all mingled together, and all moving the same way, showed that nobody was staying at home who could possibly go. At last the ground is reached, and we have time to look around. The steeple race is to be two and a half miles, and the obstructions, viewed in cold blood, make one's hair stand on end. The first jump is a blind ditch some ten feet wide, not a very hard leap, but a good thing to trip up a horse, for he can't see it until he is close upon

e yawning chasm. The next is a "rasper," a thick set ne watling with an artificial ditch twelve feet wide filled ith water on the other side. Next comes a fence between ur and five feet high, made with the points of limbs immed and set outward, as soldiers build a *chevaux de frise;* yond that are two heavy obstructions, solid plank fences ar four feet high with three feet of solid earth banked against each, and packed with a spade until it is as lid and massive as granite. Seven other fences, ditches, d water leaps have to be taken before the inventory is mplete, and one can in a measure understand what a great at it is, going at the terrific pace they are compelled to do, king in succession the different kinds of dangerous jumps d cover of two miles and a half of ground. Few horses n stand it. A strain of cart horse or milk wagon blood the pedigree will probably make him drop his tail and ll behind on the home stretch; but as much depends on the rider as on the horse. Better by far a good rider an indifferent horse, than an indifferent rider on a good rse. To come out winner of the cup at a steeple chase e must have iron nerves, a ready eye, steady hand, and ick judgment, besides being in practice and having good k.

By this time several thousand people are on the ground. e judges—the two Generals Lee, are on the stand; the ne keepers are in their places, watch in hand, and the ntestants are harnessing for the race. The costume is lite corduroys, top boots, English style, and jacket and p in the choice colors of the riders. The standard ights are 155 pounds. The horses are brought around d each is surrounded by an eager speculative crowd, hich examines his points, and discusses his chances. The lers now mount their horses and move to the starting int. There are three favorites, backed to win against field. The first is Green, who sports blue and white lors; he is a splended rider, and is mounted on a hand- ne, huge, raking chesnut gray, with very fine shoulders, d an all over like going head, the winner of last year's cup. een is the old Black Horse Cavalry's "crack," and they k him against the field. There is Rowe, with his mare ffie Deans," rather small, but light and compactly built, th elegant limbs, and as tough as a pine knot—colors, ench grey and green. Daniels rode a brown gelding, a autiful creature, with that rich tint of the horse chesnut her glossy coat. He was a little active horse with great ttom and endurance. Daniels is an Englishman, as are ers of the "chasers," and there is much good natured alry between them, and the native-born colors were mson and purple. A very good horse, with a gamy ok about him, and noble shoulders with the going name "Conet," was entered by Payne, a feather weight, who l to carry twenty-three pounds dead weight. Payne's ors were purple and orange. There were other riders, th their varied colors of black and white, blue; red and ck; and scarlet and gold, and they made a gallant ap- arance as they formed for the race, the colors showing like ainbow in the rays of the sun as they moved and mingled ether. All are in line; a lull is heard in the mingling ces—a moment of intense interest—the signal is given the flag dropping, and the lines break at full speed for run, scattered, Rowe leading about two lengths, en white and blue, worn by Slidell, with his habitual t burst, caught up with him and sailed gracefully over first blind ditch. Behind trailed black and red, who de a clean jump across, Green coming next; his horse x, stumbled and went down as though he was shot, he rose again and as he recovered his feet, his rider unted him and strove gallantly to recover and take the d, but it was not to be. The "crack" of the "Black rse" came to grief, fortune smiled not on him that day, the victor of last year's cup, pounded on behind, with no nce to overtake the flyers in front, and he is passed by except Worsely, who wearing the black jacket and ite cap, let his horse swerve from the track just before reached the water jump, and was thrown violently to ground, his foot catching in the stirrup. He was drag- some ten yards. His horse mad with fear, dashed on rid himself of his rider, disappearing over the brow of hill. Worsely rose up, swayed backward and forward, then fell prone upon the ground and lay still and quiet. y God," said the judge, "he must be killed!" "No," another, "only stunned."

But look! look! See how they run! The tailing had ameneed; every horse took the hurdles, and they rose after another like the billows of the sea. The pace s fearful and was beginning to tell on the horses, but withstanding they were ridden carefully and judiciously their riders. Still onward—and then again that fearful er jump and ditch together loomed up to the tired ses, some of whom were giving symptoms of distress, most noticeable of whom was the brown mare Queen, ien by Slidell, the chesnut mare of Rowe's literally fly- ahead of her, owing to the madness of her first burst, rple and orange riding ahead a little distauce, and eeping along third, was Harold with his magnificent dle, slowly drawing up. The water jump is reached— ear leap of twenty feet, if an inch—to clear it. Payne nering his brave little bay together, put her to it, and an arrow he was carried high and clear over the crop-

A half length behind came Rowe with Effie Deans, h her greyhound stride; she went over with a rush, and hiels with his crimson cap was seen to rise in the air land as easy as a bird on the opposite side. The favor- were having it their own way. Black, red, and white, thrown out, his chesnut grey—Murad—flying the k, the rest making desperate but unavailing efforts to ieve their lost distance; but it was a vain hope. Keep- the lead, Charley Payne held his horse in; not once had ouched spur, or plied whip, and Comet was going at a dy swinging pull, when Rowe, riding behind shouted— yue, You have dropped your weighing pad?" Glanc- behind his saddle he found it but too true, and with a vy heart pulled up.

he struggle was now between Lowe and Daniel, with Gray and Green in the advance. The chestnut mare's l was stretched out like a racer's, and with hoofs scem- never to touch the dark earth she skimmed over. Effie ns flew on to the sixth hurdle, gathered herself up in force and impetus, and then, like the rise and the op of the heron, she cleared the hurdle, launched for- d with the lunge of a spear darted through air, while ind, restless as fate, certain as death, followed Herne Hunter; Purple and crimson keeping close distance. vard and the seventh hurdle bars the way. Green and y took the leap in magnificent style and thundered riding like Grimshaw himself; the crimson cap, a mere k in the landscape, was seen to fly through the air, and descending keep on, working up slowly towards the chestnut mare that was scouring towards the winning post, where the breathless crowd watched their coming. Another solid earth and plank fence was reached, and leting their animals out, the mare and the horse, now nearly neck to neck, true to their blood and lineage, with heaving flanks and convulsive breathing, both with a masterly effort jumped it at the same moment and sped onward to the goal. The last grand rush was to take place. Not knowing, or looking, or heeding what happened behind, the two tore over the course, the Gray and Green, and the Purple and Crimson sitting even cheek by jowl, while the gallant horse and brave little mare thundered forward to the last leap. The turning flags were passed, the jump taken, and the two struggled desperately for the victory. From the crowds on the course a great hoarse roar came louder and louder, and the shouts rang, changing every second—"The horse wins!" "Purple and Crimson ahead!" "No, Green and Gray!" "The horse is up with her!" "The mare beats!" "A cracker ou the mare!" "Hurrah! Green wins; Crimson is beat!"

Was he?

As the shout rose he surged ahead; the land seemed to fly like a yellow sheet before them, and at the killing pace they rode to the winning post, every fibre strained, every nerve was at the utmost tension. One moment and the mare nearly closed the gap. A roar like the roar of the sea broke from the thronged concourse, as the crowd hung breathless on the even race. Thousands of cheers arose, and thousands of eyes watched the closing contest, as superb a sight as the country ever saw, while the two run together with every sinew strained to tension—the horse and mare, Crimson and Gray. Louder and wilder the shrieking uproar rose—"The chestnut beats!" "The brown beats!" "Green and Gray's ahead; Daniel's caught him!" "The mare is winning! the mare is winning!" "Not yet; not yet!" "The mare wins!" "No, no; no no!"

Sent along at a pace that Epsom Flat never eclipsed, sweeping a hundred yards or so towards the judges' stand, like a flash of flame they ran side by side, their foam flung on each other's withers, their breath hot in each other's nostrils, while the earth flew beneath their stride. The final effort came. A blind ditch was in front—the last! With one superhuman crowning effort the horse swept by the mare a full length, jumped the ditch, and galloped up the straight "run in"—Purple and Crimson had won the silver punch bowl, and the brown horse swept to the judges' stand. The air was rent with deafening cheers that seemed to reel like drunken shouts from the multitude, and when the rider pulls up with the full sun shining on the Crimson and Purple, winner of the plate, there was not one who did not know that he had won it by the hardest, most dashing ride ever performed in the country.

ENGLAND HAD WON!

Time of 2½ miles, 4½ minutes.

Worsely and Green were stunned, but no bones broken.

[I have given this extended account of a steeple chase because it is a new pastime, and as the manliest sport in the world, combining all the dash and excitement of a fox hunt with the rush and "elan" of the cavalry charge, it deserves to be encouraged. Mr. C. E. F. Payne, Secretary, Warrenton, Va., will cheerfully furnish any information of the "Club" to those who desire it. Welter weights and the Maryland Jockey Club rules govern.] CHASSEUR.

FISHING AND GUNNING IN EASTERN MAINE.

SULLIVAN, Me., May 1st, 1876.

EDITOR FOREST AND STREAM:—

I am now living in a section of country in Maine, east of the Penobscot River, where, although known to some sportsmen, no writer, to my knowledge, has ever visited. If I am wrong, the lucky wearer of my wished-for honors will be kind enough to appear and correct me. This place is called Sullivan, and is very prettily situated, with a charming view opposite the far-famed Mt. Desert Island. The presence of trout is made plainly evident as you ride into and through this section. Everywhere you see brooks running swiftly down hill, and emptying themselves either into ponds or in the bay below. These streams are also filled with deep holes, where, under a shade of trees, the trout gather and hold convention, and debate as to whether it is the more profitable to keep their mouths up stream and go to sleep, or dart for the flies as they dance across the water. In such places it is needless to attempt to prove by a long argumentative disquisition to a fisherman that trout are there; the only question that remains is "Can they be caught?" But if one thinks a moment does it not seem improbable that fish will not bite what is offered them when they have lain almost wholly undisturbed for years? It is granted that in some years the extreme cold, or dearth of food will cause great havoc among them; but where many have existed a few will remain, and those few will again propagate, and the brooks will be as full as before. The ponds also are but little fished, the few anglers who do go to them only fishing for their own consumption, and consequently but few are killed. Large stories are told of the immense fish caught in Tonk Pond during the winter. These are called Togue trout, and some of them are said to weigh 20 pounds. Three were caught last winter weighing 50 pounds. They say nothing about the fishing there in the summer, or after ice has cleared; indeed, upon inquiry, nobody will say they ever fished there in summer, or ever heard of its being done. My argument is self evident. If some one should fish there in the summer a large return for their trouble would no doubt be given them. Salmon have never been caught here, I believe, and I hardly think that one can be found nearer than the Penobscot.

Any one coming during the spring or fall, if not successful in fishing, might have very good shooting. Lately the bay has been full of birds, the geese predominating, and although they have been very wild, many have been shot by the rural sportsmen. Ducks and coots will probably stay through May and June. They are killed but little in the spring, for few have confidence enough to launch their boats; and they are not tame enough to shoot when flying over. In the fall, however, they meet with a warm reception, and all who are possessed of any kind of gun take this occasion to loosen the rust which hangs to it. The coots then are the birds who receive the largest share of shot, and they are much weaker in numbers as they again depart. The ducks are very wild, and decoys are much used in shooting them; and the loons are so thick here that by mistake you shoot at them instead of ducks, upon which they disappear, and "all is blank." BOCEPH.

—A cod has been lately caught in England in whose stomach was found a tangled mat of horse hair and string, entwined with ten fish hooks, two of which are large ones. It is supposed that the cod had swallowed haddocks or whiting caught on the hooks. Seals often do this, and the hook passing into the intestines produces death. Cod are "voracious." So are ling. One was found with a pewter flask in its stomach, containing considerable whisky. Pike frequently swallow stones.

—Several sturgeon have been caught in the river at Oswego this spring, one of them weighing sixty pounds,

Fish Culture.

IMPREGNATING SALMON OVA.

DEE SIDE, Mctapedia, N. B., May 23d, 1876.

EDITOR FOREST AND STREAM:—

The instructive series of papers on fish culture, by "Philo Ichthyos," must have been read with very great interest, and he certainly deserves the thanks of all interested in pisciculture. Having been but a short time engaged in fish breeding, I am able to add but little to the general stock, but have adopted a method of impregnating salmon ova which I have not yet seen in any work on the subject.

From having had uncommon facilities for observing the fish spawning in their natural state, and seeing that the contact of the milt with the egg must be of very short duration, in fact instantaneous, if at all, and having had from sixty to one hundred fish to spawn at once, and finding it very troublesome to have to wait for a half hour or more in order to obtain the dishes for a fresh lot, also believing it could not benefit the eggs allowing them to remain in the strong milky water, absorbing it and coagulating, as they always did, I took last year a tin pail of three gallons, perforated within three inches of the bottom; stripping one, two, or three females into it (dry, no water), or until I had one half or two gallons of eggs. I then stripped the males—commonly two—or until I obtained two tablespoonfuls of milt, into a four gallon pail without perforations, immediately adding a half gallon or three quarts of water to the milt. Shaking or mixing, and dropping the pail with the eggs into it quickly, the rush of water through the perforations causes the eggs to whirl round beautifully, mixing them up in good shape. When the water ceases to flow, I lift the pail and give it one more dip, setting it then into flowing water deep enough to cover the eggs, and the performance is over. In half an hour they will feel like shot under your hand—quite different when they left the fish. I found the saving of time a good deal, but what was much better, no dead eggs; and out of the ova treated this way I did not lose three per cent. I believe salmou—unless enclosed, when they will retain their ova—take about a week to deposit their eggs; therefore, care must be exercised and judgment used, which can only be obtained by practical experience, not to injure a fish in stripping, particularly if heavy or strong, and not to attempt taking more ova at one time than is really ripe, or the fish is willing to give. Ripeness is, of all things, necessary in the male as well as the female, and unless the eggs will flow when the fish is nearly perpendicular, put her back for another day.

"Ichthyos" is correct when he warns us to beware of moving or shaking the eggs in their early stage. I now attribute my first year's loss partly to fussing, washing, and cleaning sediment from the eggs. I have since taken a portion of a lot by experiment, and by lifting the tray every day to the top of the water and shaking the eggs, have had every one dead in thirty days, while the untouched balance hatched out all right. I never touch or wash an egg, no odds how dirty or how much sediment, until after the first mouth. Gravel only catches the sediment, and is of no use. I believe the old fish only use it to protect the fish from their natural enemies.

Will some of your savans give us their ideas of the use of the hook, or protuberance, which grows so rapidly on the upper jaw of the male. I have seen it fairly forced through the skin of the upper, and on large males three inches long. When they first come from salt water you can only judge the sex by the length of head—"no bill or hook" to be seen. That they don't use it for nest-making is certain; the male don't work at that; he lays off watching the performance, and will chase trout, or a smaller male. I never saw a fight between males. One always seemed to run when the other charged. The bill also prevents the teeth from touching, and a male at spawning time cannot shut his mouth by an inch or two. If it grew downwards, from the upper jaw, he might use it as a pick, and root gravel like fun. The nest is made by the female by the action of the tail, fins, and body, always in rapid water, commonly from two to three feet deep. If the bottom, or gravel, is of the right sort, it is surprising how quickly the nest is made. Every pair of fish, if not disturbed, finishes on the one nest, and when done they will cover it by rolling large stones on the top from eight to fifteen pounds weight. In this river, whenever they finish spawning, they drop down stream, and the fish which enter in spring are all in salt water by 10th November. There is a run of fall fish here, coming in just as ice forms, and remaining in the upper waters all winter, coming down in June. These are known as kelts, and are a nuisance, of no use either for sport or commerce, and I believe feed in the winter on young fry, going to salt water in July, coming back in fine condition early in November. I took four of them last fall, and obtained 2,000 eggs from one, but would not breed from those fish even were it possible to procure them.

I have now in breeding house 350,000 eggs since 15th October, or 200 days; only ten per cent. are out; temperature of water when laid down, 45°; 12th November, 38½°; midwinter, 33°; at present, 37. It will be no warmer until snow runs out, which may be 8th June, as there is still four feet in green woods. Some of the little fellows have been throwing their covering since 15th April, but few of them survive; the water is too cold. Some of them get their heads out and give it up. Perhaps 3,000 have gone by these premature births. As for hyasus, I never had it here, nor ever yet saw it, nor do I want to. It was probably the cause of the great mortality in Miramichi last year, when 1,000,000 of eggs died in a few days, just as they were coming out. I have a theory that every fish knowing its own river, which, I believe, is admitted, knows also its own breeding ground; or, to use a simile, "where it was born and brought up," and when it returns from sea does not go above that place unless frightened or forced. I have seen the same fish for three years in succession spawning at the same place, or within a yard of it. This is going a good way to prove it, which I hope to do next winter. JOHN MOWATT.

FISH IN NEBRASKA—PRODUCTS OF THE "ELKHORN WRECK."

JACKSON STATION, Nebraska, May 19th, 1876.

EDITOR FOREST AND STREAM:—

April 20th I visited Elkhorn, but owing to wind blowing a gale was unable to "wet a hook" with any success. On my return I dropped a note to Hon. George N. Crawford, of Elkhorn, an enthusiastic angler as well as sportsman, to which I received the following reply:—

ELKHORN, Neb., April 23d, 1876.

R. G. C:—

Replying to yours of 21st I have no positive knowledge as to whether or not "any fish known to be from the Elkhorn wreck" have been caught, but I believe there have been, and that I have caught them. I took with spoon cast fall from the "Horse Shoe" (a lake you are familiar with) several (five or six) black bass, differing from the "willow" bass, the only variety I have ever before taken in any of our lakes here. Where the black bass came from, unless from the "wreck," I cannot even surmise. I also took in the same lake, and on the same day, a "green pike" weighing about 2¾ pounds, similar to several of the same species or class which I obtained at the wreck, and the only ones of the kind I ever saw in this country. From this I base the belief I have caught them. As to those that Collins transplanted, I have heard nothing. No care was ever taken of them; but I contemplate a trip to the lake this spring for the purpose of ascertaining whether or not they are there. After my trial I will give you results, if you so wish.

GEO. M. CRAWFORD.

Mr. Crawford knows what he is writing of; still I think he is in error in regard to the black bass, as I have taken from the "Horse Shoe" fish identical with those I have caught in Lake Erie, and streams tributary thereto in northwest Ohio, and always called them black bass.

I saw large numbers of fish in both the Elkhorn River and Horse Shoe Lake—varieties unknown to me, some light yellow in color and others spotted. I supposed them to be varieties of bass. The "Collins" fish were taken to a lake (or rather pond) ten miles east of Elkhorn. I don't think it possible that they will be found, as the pond is shallow and in the open prairie. I have requested Mr Crawford to give me a report of his investigation, as I find it impossible for me to go there again, and if of interest will give it to you.

Hon. A. J. Arnold, of Columbus, this State and county, also took a large number of fish from "the wreck" and put them into ponds near Columbus on his farm. Last July he called to take me for a ride, and we went to one of the ponds; saw a great many fish "in nests" that I called black bass, but Arnold claimed they were "straw bass;" would not allow any caught that year; said he had taken some from another pond, and was certain what they were. Arnold is now on the Upper Elkhorn, or in the Black Hills. On his return we shall sample his ponds. R. G. C.

—Nearly 30,000 salmon fry (*Salmo salar*) were deposited in the Pemigewassett River on May 22d by Messrs. Holmes and Stark, under the direction of the Massachusetts Fish Commissioners. They were the first installment of 300,000 that are to be placed in the Pemigewassett and Baker rivers. They were hatched at the Massachusetts hatching works at Wiuchester, Mass. Close attention must have been paid to them during the transportation, for on their arrival there were only ten dead fish in the six cans, containing 5,000 each. Last year the loss out of the same number was 25,000.

—The Minnesota Fish Commissioners are now stocking the lakes of the State with young salmon.

THE FIRST AQUARIUM IN NEW YORK.—Mr. Henry C. Coup, for a long time business manager of P. T. Barnum's enterprises, has begun the erection of an aquarium at Thirty-fifth street and Broadway. The ground is 100x200 feet in extent, and the building is to be one story above a low brick wall surrounding the whole plot. Mr. Coup says he will have a greater average tankage than the London Crystal Palace Aquarium. He has received promises of fish enough to fill several aquaria. Agents are among the West India isles, and along the Florida coast, and in Baffins Bay, seeking strange fish of every species. A white whale is to be one of the capital attractions. Mr. David Thomas, another of Barnum's old corps of managers, is in Europe studying the management of aquaria.

THE SHAD FISHERY OF THE POTOMAC.—The shad fisheries have not been profitable this season in any of the southern rivers. This is true of the Potomac especially. A correspondent of the Rutland *Herald*, writing from Knight's Ferry, Va., says:—

"Unless the measures now being adopted for restocking the streams and protecting the fish are continued, edible fish will become, like the *great hauls* of which the fishermen often speak, things of the past. I came here with the hope of aiding the United States Fish Commissioner and other friends of fish culture in the work of saving from the remnant of edible fish enough ova and young fry to not only restock this river, but also to plant out shad in other streams where none are now found. The 'spawners' and 'milters' are culled out from the fish obtained at the several fisheries on this stream and 'stripped.' The impregnated ova are then taken and placed in hatching boxes, anchored out in the stream, where they remain from three to five days before the embryo shad breaks the shell and comes out a tiny, transparent, active fry about half an inch in length.

"In a few days' time the 'umbilical sac,' from which the young fish get their nourishment, is absorbed, and it is at this stage of their existence that they are turned loose into the stream to take care of themselves. Up to this time no one has been able to discover a kind of food suitable for shad fry, and consequently no shad are ever raised artificially, and but little is known with certainty of the rapidity of their growth or the transitions through which they pass, from the time they are hatched till they are large enough for the table.

"Up to this time all the young fry at this place have been turned loose into the Potomac, but with the last run we hope to get ova enough to be able to send off several hundred thousand young fish to other streams, and the United States Commission have already taken active measures to do so at an early day."

Natural History.

[This Department is under the charge of a competent Naturalist, indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

BIRDS OF LOWER MICHIGAN.

BY A. B. COVERT, OF ANN ARBOR.

(*Continued from Page* 214.)

FAMILY ICTERIDÆ.

Dolichonyx oryzivoros. Boboliuk or reed-bird. This well-known songster is a very common summer visitor, arriving by May 20th. The males come about ten days before the females. About June 10th the eggs are laid, and by the 1st of July the young are turned away to shift for themselves. The nuptial dress is now changed for one of more sombre color, and by September 10th they depart for the south.

Molothrus pecoris. Cow-bird; very abundant after the middle of March. It builds no nest of its own, but deposits its eggs in the nests of other birds from April 1st to July 1st, and leaves us about the middle of September.

Agelæus phœniceus. Red-winged blackbird. Very common, arriving about March 15th. The nest is built May 20th. It remains until the last of September.

Sturnella magna. Field lark or meadow lark. Common after March 15th, and sometimes is resident. The nest is built about May 10th. This lark departs the last of October.

Icterus spurius. Orchard oriole. Common; arrives about May 1st and lays its eggs by the 5th of June.

Icterus Baltimore. Baltimore oriole. Very common from the 25th of April. The nest is built about June 1st, and both orioles depart by the middle of September.

Scolecophagus ferrugineus. Rusty grackle. Common in the migrations, arriving about March 25th, and passing in the fall in October.

Quiscalus purpureus. Purple grackle. Very abundant; arrives about the middle of March, and the eggs are laid by April 20th, two broods being reared in a season. It goes south by the middle of October.

Corvus cryptoleucus. Raven. Very rare; one specimen taken March 27th, 1873.

Corvus americanus. Common crow. Common and resident, breeding about the 1st of May. Eight years ago this bird was very rare in this locality.

Cyanurus cristatus. Blue jay. This handsome bird is a very abundant resident, breeding about May 10th.

Perisoreus canadensis. Canada jay. Resident but rare. One nest was taken May 27th, 1872.

—It has been found that the small river lamprey eels attach themselves by means of their powerful sucker mouths to the muskalonge (*Esox nobilior*) and suck its blood. But on the other haud, the muskalonge devours the lampreys whenever it can.

—It would be a very important accommodation to us if correspondents would write on one side of the sheet only, would use no abbreviations, and would allow us to use their full name in publication, instead of a pseudonym.

—Fish culturists should not hasten to go to the Centennial Exhibition, as the aquaria are not yet in proper shape in spite of Fred Mather's earnest efforts.

—The New York Academy of Sciences will orgauize field parties in geology, botany, and natural history, and make excursions to the suburbs as soon as the weather becomes favorable.

—Augite and graphic granite—new minerals on the list for Manhattan Island—were recently exhibited to the New York Academy by B. B. Chamberlain.

—For some weeks past three beautiful pigeons have made their home in the framework above the roadway in the New York tower of the Bridge. They have been pets with the laborers on the tower, and have become quite tame.

MAXIMUM LENGTH OF THE BLACK SNAKE.—How long does the black snake (*Bascanion constrictor*) continue to grow? What length have they been known positively to attain? Can some of the many readers of the FOREST AND STREAM furnish accurate figures from careful measurements, personally made? Every summer I find my longest specimens exceeded by one inch or more—*i. e.*, if the statements of my neighbors are correct; but I never have had the "monsters" they have killed in time to see and measure them. One that I killed in 1860 measured exactly 6 feet 11 inches, and I have met with no other that equalled it in length. That still larger ones have been seen I have, however, no doubt. A snake when in rapid motion appears nearly twice his actual length, and no estimate of his dimensions can possibly approach correctness. Statements have been made to the writer very frequently of the occurrence in various localities in this State, of snakes that *appeared* to be ten and twelve feet long. No such specimens have been secured for our museums, and the maximum length is apparently undetermined.—CHAS. C. ABBOTT, M. D., Trenton, N. J.

A WHALEMAN'S OPINION OF SQUID.

SYRACUSE, N. Y., May 25th, 1876.

EDITOR FOREST AND STREAM:—

Your article on the cuttle-fish, in your issue of May 4th, recalls some incidents within my own experience. When cruising on sperm whale ground I have frequently seen fragments of "squid" float by—remnants of a whale's repast—an infallible sign that "Old Blowhard" was somewhere in the vicinity. A small species I have seen among the South Sea Islands, near the rocks, but the larger kind are seldom or never found away from blue water. Old salts have a tradition something similar to that of the Bishop of Bergen, concerning the existence of the "great white squid," and solemnly say that "no ship that has seen it will ever return to port." I think them peculiar to no sea or zone, as I have sighted their floating fragments in various parts of the three great oceans. In 1857 my boat was fast to a large "bull" on the "off-shore ground," in the Pacific. While in his flurry the whale disgorged a huge section of squid, which passed within an oar's length of us, so there was a good view of the thing as it drifted by. I judged it to be fully fourteen feet long. It was bitten or torn at both ends, and the taper was gradual, so that when a living member it was doubtless longer. Its width was about eighteen inches at the base. The suckers appeared to be all on one side, without much uniformity in position or size, and almost as numerous in proportion as the spots on a peacock's tail. Its color was creamy white, and there seemed to be no particular color. On the under or sucker side it was somewhat flattened. We killed the whale, which furnished 110 barrels of oil. E. R. WILSON.

LETTERS FROM ORNITHOLOGISTS.

WEST MEDWAY, Mass., May 22d, 1876.

EDITOR FOREST AND STREAM:—

Early on the morning of May 19th, in a little more than an hour, I obtained in a small piece of heavy woodland, in this town, one black-throated green warbler, two black throated blue, two black-and-yellow, two bay-breasted, one Blackburnian, and one Cape May warbler. I also saw several chestnut-sided and yellow-rumped warblers, and heard the summer warbler. This makes nine out of the thirteen species of *Dendroica* that are observed in eastern Massachusetts, found in one place at one time. Have any of your correspondents outdone me? I also obtained on May 17th, a prairie warbler, which is very rare in this vicinity; and on May 16th I saw a Wilson's black-cap (*Myiodioctes pusillus*) for the first time at this place. CHAS. A. HOUGHTON.

NEWPORT, R. I., May 20th, 1876.

EDITOR FOREST AND STREAM:—

I have read your natural history notes with great interest, and I enclose you herewith memoranda of the dates of arrival of some of the birds common to this locality:—

April 12th.—Song-sparrow; robbin about same date.

April 16th.—Red-winged black-bird.

May 6th-8th.—White-bellied, swallow, purple Martin, Baltimore oriole, chimney swallow, and cat-bird.

May 14th-19th.—Brown thrasher, orchard oriole, bobolink, and warbling vireo.

The Savannah sparrow was nesting on May 15th. Robins, white-bellied swallows, song-sparrows, blue birds, and crows are nesting at this date. All the birds were very late this year in their arrival and in their nesting. J. S. CONLAND.

GAINESVILLE, Cooke Co., TEXAS, May 16th, 1876.

EDITOR FOREST AND STREAM:—

If the following notes are of any service to you please use them:—

February 15th.—collected a male arctic blue bird (*Sialia arctica*) and a female of Harris's finch (*Zonotrichia querula*). The arctic blue-birds have been here in great abundance since December 1st.

March 17th—First flock of curlews (*Numenius borealis*). Killed a male red-shouldered buzzard (*Buteo lineatus*) on the nest; it was on at 9 A. M., and also at 4 P. M., and perhaps was incubating. Robins and arctic blue-birds still here.

March 21st.—Black-bellied long-spurs (*Plectrophanes ornatus*) abundant; Maccown's bunting (*P. Maccownii*) appears to have been gone for a month.

March 27th.—Fox-sparrows still here. Scissor-tailed flycatchers (*Milvulus forficatus*), white-eyed vireos (*Vireo noveboracensis*) and blue gray flycatchers (*Poliuptila*) observed. Wild geese and cranes are migrating northward.

April 1st.—More scissor-tailed flycatchers; arctic blue-birds not seen. Canvas-backed duck killed; rare here.

April 3d.—Prairies appear to be covered with black bellied longspurs.

April 10th.—First swallow-tailed kite (*Nauclerus furcatus*) of the season. Robins yet plentiful.

April 11th.—One swallow-tailed kite and one Mississippi kite (*Ictinia mississippiensis*) seen; also young crows.

April 12th.—The quails (*Ortyx virginianus*) are pairing for the breeding season. G. H. RAGSDALE.

LAKE CITY, Minn., May 10th, 1876.

EDITOR FOREST AND STREAM:—

Please accept the following as notes from this locality for April:—

March 25th.—Crows; not winter residents here.

March 26th.—Raining, with some snow; ice in Lake Pepin solid. A very few ducks reported.

April 1st.—Robins and meadow-larks; very early for robins, but not for the lark.

April 3d.—Ducks more plenty.

April 5.—Sharp-skinned hawk (*Accipiter fuscus*) earlier and more abundant than for many years; purple martins, blue-birds, and a nest of the chipping sparrow with two eggs, within four feet of railroad tracks; never knew before of their nesting much before May 1st. Butcher-birds plenty.

April 7th.—Red-poll warbler, early and uncommon; Maryland yellow-throat, which is very pleasant in summer; the evening grosbeaks and cedar birds are all gone.

April 8th.—Weather a little warmer. Blackbirds in limited numbers, golden-winged woodpeckers, and a few Canada geese: canvas-backs and many other ducks abundant; flocks of wild pigeons; a powee, and blue-jays, which are resident.

April 9th.—Screech owl (*Scops asio*) brought in; it is resident. Wilson's snipe are present in limited numbers. One pairs of doves were seen; do not usually appear before the last of the month.

April 10th.—Weather threatening snow, and colder. Snow-birds seen again, after having been absent a week.

April 11th.—Weather colder. Yellow birds seen.

April 12.—Storm ahead, ice still firm, and too cold for more birds. No wild geese seen since the 8th.

April 13th.—Cold; rain and snow as foretold by the appearance of the snow-birds on the 10th.

April 14th.—Warm to-day. Wild geese flying north; red-tailed hawk killdeer, tildark, and wood thrush noted.

April 15th.—Hawks, gulls and geese more numerous.

April 18.—Strong north west wind for three days, froze hard last night. Not a peep from any bird this morning.

April 21st.—Blew hard yesterday, and the ice went out of the river warmer to-day. Downy woodpecker unusually plenty has been scarce this spring; red-bellied nuthatch as usual.

April 22d.—Phœbe-bird and red-headed woodpecker.

April 23d.—Blackbirds in plenty, and more ducks.

April 24th.—Weather fine. Saw two immense flocks of brant flying low over Lake Sepin, where it never has been abundant.

April 27th.—Warm and beautiful weather. Birds all noisy and musical; no wild pigeons since the 9th, when they stayed two days; ducks and geese about all gone north.

April 28th.—Fine female of fish hawk (*Pandion haliætus*) shot; the eggs were about the size of a marrow-fat pea; blue-birds building their nests. There are more birds yet to come. D. C. ESTES, M. D.

Sea and River Fishing.

FISH IN SEASON IN JUNE.

Trout, *Salmo fontinalis.*
Salmon, *Salmo salar.*
Salmon Trout, *Salmo confinis.*
Black Bass, *Micropterus nigricans.*
Shad, *Alosa.*
Land-locked Salmon, *Salmo Gloveri.*
Grayling, *Thymallus tricolor.*

FLIES IN SEASON FOR JUNE.—Green drake, gray drake, orange, dun, dark mackerel, scarlet ibis, coachman and professor.

FISH IN MARKET.—The market is abundantly supplied with fish, and prices are unusually low. We quote:—Striped bass, 15c. to 20c. per pound; bluefish from Long Island, 12½c.; Salmon, Kennebec, 60c., California, 30c.; mackerel, 12½c.; shad, Connecticut River, 35c each; weakfish, 10c. per pound; white perch, 15c.; Spanish mackerel, 25c.; green turtle, 18c.; terrapin, $12 per dozen; halibut, 20c. per pound; haddock, 8c.; kingfish, 20c.; codfish, 8c.; blackfish 10c.; flounders, 8c.; porgies, 10c.; sea bass, 10c.; eels, 18c.; lobsters, 8c.; sheepshead, 15c.; scollops, $1 per gallon; soft clams, 40c. to 60c. per 100; brook trout, 50c. or Canada, and $1 per pound for Long Island, hard shell crabs, $3 per 100; soft do., 50c. to $1.25 per dozen.

—June is the Angler's month.

—Some fine striped bass have been taken from the boat house floats on the Harlem River; also in the Little Gate, and off 120th street, North River. Bluefish have struck in on the Long Island coast, and large numbers have been taken near Orient. The fishermen at Canarsie have also sent a number to market. Although the pound nets in the Great South Bay are taking large quantities of weakfish, the fish seem disinclined to take the hook, owing perhaps to the fact that the channels are full of schools of young bunkers, upon which they feed. A few weakfish have been taken in Prince's Bay. Sea bass and blackfish are biting freely in the South Bay off Babylon and Islip, and the squid will soon be in order in the inlet.

FLY CASTING AT THE STATE CONVENTION.—One of the contests always provided at the annual convention of the State Sportsman's Convention is that of fly casting. It is to be regretted that on the last occasion there were but three contestants. Last year, at Watertown, there were nine, the winner on each occasion, and also in '73 and '74 being Reuben Wood, of Syracuse. The place selected for the casting was not of the best description, which perhaps accounts for the result, which was as follows:—R. Wood, Syracuse, first prize, 69 feet; J. Annin, Jr., Caledonia, second prize, 63 feet; H. H. Morse, Rochester, third prize, 58 feet. The judges reported for delicacy and accuracy of cast the same gentlemen in the same order. The judges were Eugene Wakeman, of Batavia, James Harrison, of Binghamton, and Dr. A. H. Fowler, of Ithaca. The first prize was a very handsome split bamboo fly-rod, made and presented by Dr. Fowler, and it is worthy of note that the prize has been won for three consecutive years by one of Dr. Fowler's rods. Mr. Wood's cast last year was 75 feet. In '69, at Syracuse, Seth Green cast 84 feet. The casting this year was from a platform built on the bank of the Genesee River, with a bluff behind and scarcely room for retrieving an ordinary cast.

—A day or two since Warren Leland purchased in open market for the Palace Hotel, at San Francisco, twenty salmon, weighing sixteen pounds each, for twenty cents apiece—one and a quarter cents per pound. There is no need of physical starvation while palatable food is so cheap, for softening of the brain while edible phosphorus is so plentiful.

—It will be seen by the letter of our regular Barnegat correspondent that there is good blue fishing in the bay now. The probability is that these fish will appear in unprecedented numbers this season.

—The close season for bass commenced in Napan and Black Rivers, tributaries of the lower Miramichi, Province of New Brunswick, on 25th May. In all other parts of New Brunswick, including the Northwest and Southwest Miramichi, where they are are taken in greatest abundance, the close season commences 31st March.

—The Gaspereaux fishing season has been extended on the Miramichi River, Province of New Brunswick, to 1st July. It closes by Regulation on 15th June.

NOVA SCOTIA—*Halifax, May 25th.*—Messrs. Wm. Sarve and Henry Fidler came back yesterday with about four dozen fine trout, taken at Five Islands, Margaret's Bay. The heaviest weighed within a trifle of three pounds, and the lightest two pounds. They were speckled trout. C.

Yarmouth, May 23d.—Our fishing is just opening. The season is a little late; the trees are just budding, and the water rather cold. Our rivers are still a little high. The water will probably be good about June 1st. Heavy baskets of trout have already been taken. LAWSON.

HERRINGS.—Nine schooners belonging to Hahone Bay and elsewhere, arrived yesterday with full fares from Magdalen Islands. They brought 6,100 hbls. of herring, and report they were very plentiful, all the vessels that were there getting full fares. *—Halifax (N. S.) Reporter, May 25th.*

MAINE—*Bangor, May 20th.*—A trout was caught last week in one of our neighboring brooks which, when opened, was found to contain a ground sparrow, which had been swallowed entire. The trout was about ten inches in length. Trouting has been successful this spring, and many large baskets have been brought home. DON.

NEW HAMPSHIRE—*Plymouth, May 22d.*—Two gentlemen from Boston came up on Friday and returned to day (Monday) with 527 brook trout—"a great many of them would weigh a pound."

NEW YORK—*Meacham Lake.*—On May 10th I caught my first trout at the head of the lake, in open water, but the lake was not clear of ice until the 16th, the latest I ever knew it to hold. On the 20th Mrs. F. caught the first salmon trout—trolling. It weighed just two pounds. May 22d, caught a salmon trout which weighed just three pounds before dressing. As it looked very full, told my brother to open carefully and we would examine the stomache. As he cut her open, he found it was eggs that gave her the fullness; the eggs were about the size of No. 12 shot, and the two sacks of eggs weighed one pound, making just one third the whole weight of the fish. The salmon trout are very fat this spring, and bite freely. We have caught none above six pounds yet. A. R. FULLER.

NEW JERSEY.—*Kinsley's Ashley House, Barnegat Inlet, May 25th.*—First blue fish taken to-day. Jessie Birdsall took 36; several other yachts from 15 to 30 each. They run about 3 pounds. The large ones have not come in yet on account of the bunkers coming in the inlet. We look for them on the next flood tide. Black fish plenty, and good size. Mr. Harry Atwater caught 45 black fish and 16 sea bass, one pulling the scales at 5 pounds. G. M. Atwater 22 black fish, 11 sea bass, 6 pounders.

May 25th.—On board yacht Adda, 5 P. M., blue fish plenty. In crossing the Bay I passed some of the fishing fleet, and they report from 50 to 100 per boat. Capt. Christopher Grim reports 60. B.

PENNSYLVANIA—*Tobyhanna, May 25th,* 1876.—I have just returned from Tobyhanna, Pa., and considering how near it is to New York and Philadelphia I was surprised to find trout so plenty. The Tobyhanna is a stream of good size, the upper part difficult to wade, but full of trout, while farther down, it runs more even and affords better fly fishing. I found good accommodations at Case's hotel, which is near the depot, and they are very obliging in the way of furnishing teams, etc. Tobyhanna is on the Delaware, Lackawana & Western Railroad, a few stations beyond the Delaware Water Gap. There is also good fishing at Henryville and Oakland, on the same road between the Gap and Tobyhanna. Any of your readers desirous of visiting that section can obtain full particulars of

W. HOLBERTON, 102 Nassau St.

Philadelphia, May 29th.—The heavy rain of last week made a small freshet in the Delaware, and the muddy water encouraged the gillers. The sequel was not so encouraging. I do not think any skiff on the river caught more than 200 shad in the whole week. The close of the season (June 10th) is close at hand, and then the fishermen will turn their attention to the sturgeon, which are running holes through the gill nets now. The anglers are getting their tackle ready for a raid on the bass after Wednesday. SCULLS.

MINNESOTA—*Shakopee, May 26th.*—Black bass are being caught daily in Minnetonka. C. A. STEVENS.

GEORGIA.—After many years, says the Macon *Telegraph*, shad have made their reappearance in the Ocmulgee River. "A day or two ago Mr. W. B. Johnston, Jr., and another gentleman were on the river in a boat and saw a considerable number of what they supposed were large trout, which seemed to be chasing the smaller fry. Mr. Johnston fixed him up a gig and went to where he had seen the fish previously, and in a short while succeeded in gigging a shad twenty inches long."

CANADIAN FISHING PRIVILEGES.

CHATHAM, N. B., May 24th, 1876.

EDITOR FOREST AND STREAM:—

Can you inform me when Mr. Fred Curtis, of Boston, acquired the right to call the Dartmouth his own river, and also when the Restigouche was closed to the public in the interest of private parties? I have always been under the impression that the Dartmouth and Restigouche, like the Nepisiguit and Southwest Miramichi, were not handed over entirely to lessees, but that certain portions of them were reserved for the benefit of such anglers as might desire to fish them—in some cases free, and in others at a small charge per rod. I know that although the Nepisiguit is popularly supposed to be Mr. John W. Nicholson's "own river," that gentlemen and his associates have only about one-third of it under lease, while a very small portion of the Southwest Miramichi only, is embraced by the "Burnt Hill" lease of Messrs. Robertson, Dyer, Lanergan, Wood, *et al.* The rest of it is absolutely free to all. The Northwest Miramichi also—a splendid salmon stream—is, and will remain, free to the public for fly-fishing. Mr. Curtis may not intend it, but the tone of his letter to you would lead one to suppose that opportunity for fly-fishing in North Shore waters was among the things of the past. One swallow does not make a summer, nor does Mr. Curtis' little leasehold form any material portion of the good angling pools in this section of the country. D. G. SMITH.

WEIGHT OF FISH BY MEASUREMENT.

CUMBERLAND, England, April 30th, 1876.

EDITOR FOREST AND STREAM:—

In your number of April 13th, just to hand, you refer to a table of approximate weights of fish, obtained from their dimensions, published by Eaton & Co., of Crooked Lane, near London Bridge. I had not seen it before, but have been long in the habit of guessing the weight of fish of the *Salmonidæ* tribe by no doubt the same geometrical and arithmetrical process. The table you refer to is simply a ready reckoner, but any good hand at figures can do it for himself. I have no doubt that the idea was taken from Sir Humphrey Davy, our great chemist and salmon fisher. In his charming book "Salmonia; or, Days of Fly Fishing," we read that his companion, having caught a fish nearly 24 inches long, Sir Humphrey said it ought to weigh nearly 6 lbs, but not quite, and he founded his opinion on the fact that he had just weighed a fish of the same sort and similar proportions, it being 17 inches by 9, and it was exactly 2 lbs., which he took for his standard. The scales being brought the larger fish proved 5 lbs. 10½ oz. This ingenious philosopher, who let nothing escape him, hereby tested a famous proposition of Euclid, viz., Euclid, Book XI, Theorem 34—"Similar solid parallelopipeds are to each other in the triplicate ratio of their homologous sides." Put into more simple form we may state the rule thus: "Similar solids vary as the cubes of one of their dimensions." To understand the matter fully we must bear in mind that any number multiplied into itself produces the *square* of that number. Thus 4 is the square of 2. The number 2 multiplied into itself three times over gives the *cube* thereof, viz., 8. By algebraic form, then, Sir H. would state his equation thus: Let X be unknown quantity, or answer sought. $17^3 : 24^3 :: 2$ lbs. : X. Multiply the two middle terms together 17^3 and 24^3 divide by the first and last multiplied together, which your readers will find results in: X = 5 lbs. 10 oz. and some decimals. Or by common rule of three, thus: As 17 (cubed) : 24 (cubed) :: 2 lbs. to the answer.

I have tested this rule very often, and have surprised my friends, who were not aware of the process, at the marvelous nearness I have come to the absolute weight by the scales. I have no doubt you could apply it to many of your American fish, but you must take some well-grown specimen of each sort, and ascertain what a fish of such a length weighs, as a standard or data. You need not carry a pocket rule, if you will have a foot and a few inches notched or marked somehow on the but of your rod. It is well worthy of remark (*vide* your "Mitchell's Orbs of the Heavens") that the prices of telescopes are calculated by a similar method—that is, their cost varies as the cube of the diameter or breadth of the object glass. Thus, if a telescope with object glass of two inches cost £24, one of eight inches does not cost four times that sum, as some would imagine, but £1,536!! Calculated thus—as 2 (cubed) : 8 (cubed) :: £24. JACKSON GILBANKS.

[As to the growth of American salmon in eastern waters, a salmon three years old will measure seventeen inches and weigh six and a half to seven pounds, and after four years they increase in size and weight much faster.—ED.]

BASS VS. PICKEREL.

CHICAGO, May 20th, 1876.

EDITOR FOREST AND STREAM:—

One of your correspondents, "Von G.," of West Meriden, Conn., complains in your paper of the destruction of pickerel by the black bass with which their ponds have been stocked, and he more than intimates that the loss of fine strings of pickerel is not compensated by the presence of a few bass. It will probably be news to the most of your readers to learn that bass destroy pickerel, the reverse of which is certainly understood to be true. If, however, it were a fact, and your correspondent were correct, it would be the greatest blessing of the age to sportsmen. In our country, where both are abundant, we avoid the pickerel as we do dog-fish and lizzards, take him only to destroy his life, and to make room for the bass. If "Von G." will make a trip to Oconomowoc this summer and give the lakes thereabouts a trial, it is my opinion he will never want to touch a pickerel again.

And by the way, I would like to say to your Eastern readers that Oconomowoc is the loviest spot on this continent east of the Rocky Mountains. More than forty lakes lie within a radius of fifteen miles; their banks are hilly and wooded, the beeches of gravel and sand, the waters as clear as light and filled with bass and pickerel.

A friend of mine, one day last summer, took thirty-nine bass weighing one hundred and thirty pounds, and it was not an extraordinary day, either. He did not count the pickerel. The roads about Oconomowoc are the finest in the world, gravel beds on a clay subsoil. They are equal to the drives in the Central Park in New York, and you can drive fifty miles in any direction without soiling the wheels of your carriage. The sky is clear, the air is pure, and when the sun goes down behind the far off western hills it lights up the firmament with a picturesque beauty which is seen nowhere in the world save in the famous Bay of Naples. It is certainly true that Southern Wisconsin presents more attractions in the summer time than any other place in this country with which we are familiar. It should be better known to our Eastern tourists, and I am sure that a visit once made would be often repeated.

If "Von G.," or any body else, will call upon the writer, at his house on the banks of Le Bello Lake, he will prove the truth of every fact here stated. And, besides, he will give him or them a sample of black bass fishing which will forever banish the pickerel from the list of fish which a sportsman delights to take. GEO. A. SHUFELDT, JR.

AD HOMINEM.—The spirit has moved our neighbor of the *Evening Mail* to utter the following goodly apostrophe to this journal. Compliments from *females* are pretty things, and gratifying to the soul, but there is something in their bestowal by the "Mail" which is like body to Old Port; it is stimulating, bracing, and effective.

"There is no journal which in its particular department is making more rapid strides than the FOREST AND STREAM. Its correspondence from all parts of the country is peculiarly entertaining. "A paper on the "Wild Horse of America," in the issue of this week, is specially interesting, in view of the great riding feat performed yesterday ou mustangs at Fleetwood Park."

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

N. Y. YACHT CLUB REGATTA.—This event occurs on Thursday, June 8th. Five prizes of the value of $250; each will be sailed for as follows:—One for first-class schooners—those measuring 7,000 cubic feet and over. One for second class schooners—those measuring less than 7,000 cubic feet. One for keel schooners—irrespective of classification. One for first-class sloops—those measuring 2,000 cubic feet and over. One for second-class sloops—those measuring less than 2,000 cubic feet. The regatta will be sailed according to the sailing regulations of the club, and with time allowances. On the same day will be offered for competition, without classification, the Bennett Challenge Cups. One for schooners—recently surrendered to the club by the owner of the yacht Magic. One for sloops—recently surrendered to the club by the owner of the yacht Vision These challenge cups will be sailed for according to the sailing regulations of the club (with time allowance), the winners to hold the same for thirty days after the race without liability to challenge, after which date they are to be held subject to challenge in accordance with the deed of gift. Entries to be made as usual and time allowance to be calculated as formerly.

The following are the officers of the Toronto (Canada) Rowing Club for the current year:—

Ph. De Gruchy, President; Geo. Gwatkin, Secretary-Treasurer; Geo. Duchie, Vice-President; J. Dibb, C. Annis, Auditors.

THE AMERICA CUP.—The New York Yacht Club have finally agreed to sail, as proposed by Commodore Gifford, of the Canadian Yacht Club, a match for the so-called Queen's Cup, one yacht to be named against the Countess of Dufferin, with the proviso that in case either the challenging vessel or the yacht to sail against her be disabled before the start on the day fixed for any of the races, then such race shall be postponed until repairs have been made. The race will take place on July 10th, 12th, and 14th, viz.:—The first, over the New York Yacht Club course; the second, twenty miles to windward and return, starting

from Sandy Hook, and the third, over one of the above courses as shall be determined by lot if a third contest should be necessary.

NEW YORK ROWING CLUB.—The spring regatta of this club was rowed on the Harlem on Saturday last. The first race was for four-oared shells, one mile straightaway, manned as follows:—

Blue—Bow, C. G. Peters; No. 2, J. P. Kingsford; No. 3, E. Kelly; stroke, E. G. Cruger.

White—Bow, C. D. Ingersoll; No. 2, P. De Folrez; No. 3, C. H. Leland; stroke, G. L. Rives. The white won by two lengths in 7m. 6s.

The next was the race for six-oared gigs, for which the following crews entered; course same as before:—

Red—W. R. Stewart, bow; G. Sherman, No. 2; T. R. Greeu, No. 3; R. B. Hartshorne, No. 4; J. A. McKim, No. 5; J. P. Kingsford, stroke, and C. Frothingham, coxswain.

White—G. Vail, how; J. C. Ogden, No. 2; H. Oelrichs, No. 3; J. T. Van Rensselaer, No. 4; C. M. Oelrichs, No. 5; E. C. Cruger, stroke, and August Belmont, Jr., coxswain.

Blue—C. D. Ingersoll, bow; P. De Florez, No. 2; C. G. Peters, No. 3; E. Kelly, No. 4; C. H. Leland, No. 5; G. L. Lewis, stroke, and F. L. Leland, coxswain. After a well-contested race Mr. Kingsford's crew won in 6m. 25s, Mr. Cruger's crew second. A handicap sculling race closed the sports.

—Mr. R. H. Huntley's new sloop yacht, the Niantic, built by Alonzo Smith, of Islip, has been launched. She will be the largest sloop in the Brooklyn Yacht Club.

—The Inman Steamship Line brought over the new eight-oared shell for the Yale University crew free of freight charges.

—Harvard has already raised by theatricals and otherwise more than $2,000 for its university crew.

SCHUYLKILL NOTES.

PHILADELPHIA, May 29th, 1876.

EDITOR FOREST AND STREAM:—

Last summer there was an effort made, principally by the Commodore, to induce the several clubs of the Schuylkill Navy to hold club regattas every week. I am glad to see that the idea seems to be taken hold of this year in spite of the foreboding that the interest in the Centennial Regatta would be detrimental to club rowing. The Undine, Crescent, and Quaker City, have each devoted a day to club contests. The Pennsylvania had a "scrub" on the 20th, and the Vesper, (a non-navy club) will hold a regatta on the 3d prox. that promises to be of no little interest. These meetings are of more importance than is generally appreciated. They promote a rowing spirit that cannot be gotten out in open regattas; they popularize the sport among the best of our citizens, as is proved by the crowds that attend them. There should be one every week.

On Saturday the Quaker City Club held their Eighteenth Annual Regatta, and it proved a very decided success. It is a a fair indication of what may be expected in August and September when crews from all the world will contend. Their first race was for single sculls from Girard Bridge to the boat house. There were entered Messrs. Gormley, Pleasonton, and McBeath. Gormley won by a good lead. Pleasonton, second, McBeath third.

The four-oared shell race, same course, was won after a sharp struggle by the following crew:—McBeath, (stroke), Ferguson, Wood, Stinson, (bow). The defeated crew—who came in not more than six feet to the rear, had the lead until within a hundred yards of the finish, when a spurt of their adversaries reverted the honors from them—was Adams, (stroke), Pleasonton, Wise, and Gormley, (bow). Third came the double scull race, from the house to the Zoological Garden and return. Adams and Wise won by a length, by a spurt just at the finish. Carlisle and Stinson not being able to maintain the slight lead they had held until then.

The gig race over the same course as the last, was between McBeath, Pleasonton, Ferguson, and Wood, and Adams, Gormley, Wise, and Stinson. Gormley's crew won by a length. The six-oared barge race between three boats was very exciting. The Falcon went away well, and seemed in a fair way to win, but the line on the return was Cygnet 1; Falcon, 2; Mischief, 3. There was not half a length between the first and third boat. The winning crew was Gormley, Ferguson, Wise, Iddenge, Roberts, Sower, and Reyburn Cox.

All the races were manully close, and the applause of the guests was meant as much for the losers as the winners. The officers of the regatta were: A. Crow, Jr., starter; Wm. Arrott, judge; Jas. Moorehead, time keeper; commodore James M. Ferguson, umpire.

The action of many of the foreign clubs in reference to the Centennial regatta, is yet indefinite, but each advice assures the navy that the entries will be more numerous than at first supposed. If the College Associations had been willing to accommodate their regatta to this one, in time, place, or style of races, I think Mr. Rees' mission to England would have been more successful. Although it is felt by the Regatta Committee that every one in the interest of Saratoga and of the College Association, is working hard against Schuylkill's interest, there is no doubt that the committee will do all they can to further any international rowing contest in America this year, even though it should be a race on some other waters. The temperate and national feeling that has characterized the management of the Exposition seems to pervade every thing that is in any way connected therewith. The foreign clubs are disposed to recognize the official character of the circulars sent out under authority of the commission. SCULLS.

METAL SAIL BOATS.

JACKSONVILLE, Fla., May 15th, 1876.

EDITOR FOREST AND STREAM:—

At page 322 of issue just received, I find some courteous strictures regarding the "Boat for Florida," and as this subject interests many of your readers, I solicit space for a reply. Your correspondent "Rip Rap" inquires why a boat should be built of cedar." In answer I will say because it is light, tough, durable, and adapted to withstand the assaults of sharp-pointed limestone rocks, razor-edged coon oysters, and "nigger heads," so plentiful along the southwest coast of Florida. We have a distinct recollection of a certain occasion when our friend, the Editor, attempted to walk for some distance on the sharp-pointed and jagged corralline rock on the south side of the Homosassa River, and we would like his opinion regarding the effect that would be produced on the bottom or sides of a boat constructed of zinc or galvanized iron, by coming in contact with such rocks when under head way. If "Rip Rap" ever attempts the navigation of the southwest coast in one of his metallic boats, I would advise him to provide and carry a full supply of metal patches, soldering irons, solder, rivets, etc., etc. We have been there and are posted with regard to the difficulties to be encountered, and must conclude that R. R. has not visited the locality. I speak from experience and observation, and not theory.

I admit that the torredo attacks wooden boats, but can assure R. R. that the industrious little borer is not found in fresh water, and as the majority of sportsmen mainly confine their wanderings to fresh water lakes and rivers, the objection possesses no weight. If cruising along the coast, it is an easy thing to run up one of the many fresh water streams, and destroy existing worms by a few hours' immersion in fresh water. I used the good boat Spray for one season on the southwest coast, and she suffered but little, if any, from insects. An occasional coat of copper paint, or boiled down gas house tar with arsenic, applied hot, will prevent the trouble referred to.

The writer recommends zinc as a substance adapted to the construction of bonts, and he is in error, for it is brittle and liable to oxidize, soon becoming more holey than righteous. A properly constructed iron boat is an expensive luxury, and one that cannot be easily repaired by the tourist or the first jack-log carpenter that is available. The owner of a wooden boat can supply himself with a few sheets of copper or yellow metal, some stout duck, and tinned tacks, and if an accident should happen he can apply a poultice of duck, tacking over it a piece of the metal, and the boat becomes sea-worthy.

Your correspondent recommends a boat to be "built on the same plans and models of the sailing skiffs of the shallow waters of the Delaware, and in constant use at Burlington, Bristol, Beverly, and Bordentown, which would be fully equal to all the wants of the tourist and sportsman while voyaging through Florida waters, etc." Now, Mr. Editor, I must dissent from the statement of "Rip Rap," and thereby prevent tourists and sportsmen from being disappointed. Until recently I was for years a resident of one of the above named towns, and am perfectly familiar with the boats used on the Delaware River. Skiffs adapted to rowing, fishing, and shooting are used on that river, but we unhesitatingly assert that they are not adapted to Florida cruising. The boats he refers to are unfit for coasting, not safe or comfortable on our large lakes or rivers where a heavy sea soon gets up, and they are certainly not adapted to carry sportsmen's outfit and plunder for a six weeks' cruise, and nightly to lodge the owners. When "Rip Rap" has navigated the southwest coast as I have done, carried forty days' provisions, and made stretches along the coast of forty miles without a harbor or shelter, I have reason to believe that he would not make the attempt in a Delaware River sailing skiff, even though its skin was composed of zinc or galvanized iron. I fancy, Mr. Editor, that you have a moist recollection of the day when you, the "Infant," and "Al Fresco", started from Cedar Keys, bound for Homosassa in a boat of a Delaware River model, and how glad we were to return to the dock and dry our clothes and impedimenta in a hotel.

A boat for Florida cruising should be portable, and combine the merits of a sneak-box and a Whitehall boat. She must be strong, able, deep between deck and ceiling, and specially modeled for the work. I have designed or modified such a boat, and shall briefly describe her: Length, 15 feet; beam, 4 feet 8 inches; depth between deck and ceiling, 17 inches; almost wall-sided, and flat in floor at point of greatest beam; good entrance and exit, or in other words, fine lines forward and aft; deck same as sneak-box, dipping 5 inches from centre of cock-pit to each side, and to stem and stern; cock-pit 4 feet long by 2 feet 2 inches wide; hatches 10 by 14 inches abaft the mast and cock pit to stow provisions and general plunder; centre-board, 3 feet long; cat-rigged, with gaff or sprets and sliding gunter; canvas apron as in sneak box, to be used when beating to windward; bulkhead at after part of cock-pit. Owing to stowage arrangements forward and aft, sleeping accommodations can be secured in cock-pit and on each side of the trunk for two persons. When cruising, I prefer sleeping in a boat, and if a canvas awning is provided to lash over the boom, a tent and a dry and non-rheumatic bed is ever ready. With such a boat, a supply of provender, a Dunckloe stove, and a jolly companion, "Camp Life in Florida" would prove enjoyable. In such a boat provisions and plunder would be protected from the weather, two persons could be comfortably accommodated and lodged; she would be easily transported; provided with hatch for cock-pit she could be converted into a Saratoga trunk; she would work well under sail, row easily, and prove comfortable and sea-worthy in a sea way. Owing to the shape of her deck and protected cock-pit, she would weather a storm that would sink and destroy a whole fleet of Delaware River skiffs.

I write from practical experience and some observation, and can assure your readers that skiffs and open boats will not do for Florida cruising. In winter boats are in demand in Florida, and it is impossible for sportsmen to obtain what they require, and we feel assured that if some enterprising boat-builder would supply the want, that he would find it a remunerative business. Your correspondent refers to Holmes, Shaw & Brown of Bordentown, N. J., as suitable parties to build boats for Florida, and from our knowledge of these gentlemens' productions we say amen. Every sportsman who visits Florida will agree with me that good boats are wanted, and the question arises who will supply the demand? AL FRESCO.

The Kennel.

BREEDING FOR KIND.

IN Switzerland, according to the reports of an agricultural society, a breeder got a succession of heifers by following a rule laid down by Prof. Thury, a French veterinary surgeon, the formula of which is the following: When the female receives the male at the first signs of heat, the result is a female; but if at the last stage, a male. This theory of course can be put to the proof elsewhere as in Switzerland and France, and is in part corroborated by the experience of farmers, who will testify that when a bull runs with the cows in the field, there are more heifer calves produced than when the cows are driven some distance to a bull. The presumption would seem to be that in the first case the cows are served when early in heat, and in the latter, that before the cows reach the male, they are at the end of the heat.

The theory of Prof. Thury above referred to, was first published in this country, through the columns of the *Country Gentleman*, in a translation from the author's pamphlet in French, twelve or fifteen years ago. It maintains a perennial circulation in the papers—now on one side of the Atlantic and now on the other—always with an air of novelty and freshness, as if it had never appeared before. In referring thereto the *Country Gentleman* remarks:—

"Nothing has ever been heard from M. Thury or his theory, so far as we are aware, since the time of its first promulgation—except by way of repetition of what was then advanced in its favor. There is undoubtedly a basis of truth about it, worthy of application in practice, but that it uniformly or unfailingly secures the desired result, is by no means the case."

This matter is well worthy the attention of breeders, in its application to dogs. We have frequently heard it alleged that by preventing the meeting of the dog and bitch until the latter period of the heat, the produce will generally be a large percentage of dog pups in the litter. Others assert that there is no reliance to be placed in it. But as every breeder prefers to have as many dog pups as possible, we suggest the propriety of following the rule laid down by Prof. Thury, the French veterinary surgeon, and we will be thankful for the result of their experience.

THE KENNEL REGISTER.—Owing to the absence of a portion of our staff at Geneseo during the State Convention, a large number of pedigrees are awaiting entry in the Kennel Register. The certificates will be forwarded at an early day. We propose publishing in a few weeks an abstract of the Register, commencing with the first one hundred dogs and giving the names of owners and breeders, sire and dam, etc.

—Mr. F. H. Bierhower, of Maysville, Ky., writes us that his imported Irish bitch Kitty, gave birth on last Thursday to nine very handsome puppies by her sire, Plunket. Five are dogs and four are bitches, and all very nearly resemble their sire. The markings are so nearly identical that he has not yet been able to find any differences.

—In our issue of the 18th ulto., the date on which Mr. J. Arctas Clark's dog Frank was whelped, should have read July 12th, 1875, instead of '76 as printed.

THE GENESEO BENCH SHOW.

An effort was made to hold a bench show of dogs in connection with the annual convention of the State Sportsmens' Association at Geneseo, last week, but whether it was owing to a lack of notice, or whether the distance was so great as to deter sportsmen, the show was a failure. It might have been made nearer a pecuniary success, however, had a suitable building been provided; as it was, the dogs were placed on the fair grounds away from the centre of the building, and not even on the road to the shooting grounds where they might have attracted the attention of visitors. The list of entries was small although the dogs exhibited were not without merit. The list of awards were as follows:—

CLASS 1.—Imported English setters.
1st, Don, C. D. Wagstaff, Babylon, Long Island, N. Y.

CLASS 2.—Native English setters, over 1 year.
France, Asa L. Sherwood, Skaneateles, N. Y., 1st prize, and also the handsome silver cup valued at $75, given by the Chicago *Field* for the best setter in the show. Best dog pup Mac, same owner; 2d best, Mart, same owner. Best bitch pup, Moll, same owner.

CLASS 3.—Native and imported Irish setters.
1st, Bob, H. R. Jones, Buffalo.

CLASS 4.—Gordon setters, over one year old.
1st, Lou, Wm. M. Tileston, New York. For best dog pup under one year, Doctor, John B. Sage, Buffalo.

CLASS 5.—Pointer dogs above 50 pounds.
1st, Ike, F. D. Brown, Mt. Morris; 2d, Dash, Thomas Goulding, Rochester. Best bitch, 1st, Spotless, Eugene Wakeman, Batavia; 2d, True, C. C. Fitzhugh, Mt. Morris.

CLASS 6.—Pointer dog pups.
1st, and 2d, Dash and Faulkner, C. C. Fitzhugh, Mt. Morris. Pointer bitch pups. 1st and 2d, Silk and Flea, C. C. Fitzhugh.

CLASS 7.—Cocker spaniels.
1st, Shot, Henry Todd, Batavia.

CLASS 10.—Fox hounds (dogs).
1st, Drive, and 2d, Sport, D. Hurlbut, Mt. Morris. Bitches.—1st, Belle, D. Hurlbut.

CLASS 11½.—Greyhounds.
Diploma for Bitch, Lufra, C. C. Fitzhugh.

Judges—Dr. R. V. Pierce, Buffalo, and Chas. Lincoln, Detroit, Mich. The dogs received the best of care at the hands of Mr. Lincoln, Superintendent, who will, we understand, have charge of the dogs at Philadelphia.

THE "THREE CELEBRATED DOGS'" PICTURE.

EDITOR FOREST AND STREAM:—

NEW YORK, May 18th, 1876.

It is not often that I take time to correct errors, such as appeared in an editorial notice of your paper of the 18th inst., but as my sense of justice had been previously annoyed, not a little, by the matter in question, I must ask space in your valuable journal to put your readers right, who, you said, "Will remember a picture of three celebrated dogs, Don, Peg, and George, after a painting by Bispham, which ornamented our columns some time ago, this picture has appeared again in the shape of a handsome chromo-lithograph, issued by Messrs. Strobridge & Co., of Cincinnati." Now this handsome chromo-lithograph is neither a copy of my painting of the dogs Don, Peg, and George, done by Bispham, nor of the engraving which appeared in your journal, which latter was taken from a photograph of said painting. Neither does the lithograph issued by Strobridge & Co. give a likeness of my dogs, Don, Peg, and George. It is taken from an entirely different painting, a pseudo copy of my painting which in no wise represents portraits of my dogs. I consider that Strobridge & Co. have done a very improper thing in issuing a circular stating that their lithograph is a portrait of the dogs imported to this country by the late Sir Fred. Bruce, which is entirely untrue. Beyond the principle of the thing, I have no motive in writing this correction, as you are aware I freely gave my consent that you should produce a cut of my painting in your paper, and was very glad that it was in my power to do anything which might lend to the interest of FOREST AND STREAM or its readers. Strobridge & Co. never communicated with me on the subject; but chose to "go it blind," and in consequence have foisted on the public a weak attempt at an imitation, and what the celebrated painter of my picture characterizes as an "abortion." Trusting that in the interest of truth, you will give this an insertion in your next issue.

A. RUSSELL STRACHAN.

We give space to Dr. Strachan's letter with pleasure, but feel that it is necessary that we should ourselves say a few words on the subject. The chromo under discussion was first introduced to us at the Springfied Bench Show by Mr. Bispham, the celebrated artist, who painted Dr. Strachan's picture, and who expressed himself to the officers and members of the Rod and Gun Club and to the numerous exhibitors of dogs then present, in terms quite different from those contained in Dr. Strachan's letter. As Mr. Bispham visited Springfield in the interest and for the purpose of pushing the sale of this picture, it is a little remarkable that he should not have first consulted Dr. Strachan; but this is a matter with which we have nothing to do. As for the picture itself we hold to our original opinion, that it is a most excellent chromo, one of the best we have ever seen, and at the price ($3) we can cheerfully recommend it.

KENNEL PRODUCE.—Mr. M. P. McKoon, of Franklin, N. Y., reports a fine litter of cocker spaniel pups, whelped on the 23d inst, comprising five dogs and two gyps. They are from his noted blue blood stock.

MR. BURGES' BOOK AGAIN.

BOSTON, May 15th, 1876.

EDITOR FOREST AND STREAM:—

In your last issue "Guido" takes up the cudgels for Mr. Arnold Burges' book, in answer to a criticism on said work over the signature of "Vindex." I have no desire to enter into the lists in a discussion with "Guido," as, unless my memory fails me, I have seen in past years a canine controversy carried on in one of the sporting papers, in which the compliments interchanged, and the liberal use of the *argumentum ad hominem* was such as to convince a tyro that he might as well cross rapiers with the crack *Maitre d'armes* of a regiment of the Guards, as to attack "Guido" with the pen. Not nevertheless, although he has cut and slashed at "Vindex" in the most brilliant manner, I must say that I do not think he has controverted the gist of the latter's article, viz., that the "American Kennel and Sporting Field" was not what the public were given to understand it would be, and not worth the price asked for it.

That it adorns the centre table in "Guido's" parlor is no doubt flattering to Mr. Burges; but that in that account "Vindex," Tom, Dick, and Harry and I should feel that it was worth the $4.50 we paid for it, does not follow in the logic that they endeavored to teach me at Harvard.

The book is very well as far as it goes, being very clearly and pleasantly written, and if only claiming to be a reprint of various articles on the subject of the sporting dog, and put on the market at a reasonable price, could not but have been considered a valuable addition to sporting literature. But from its title, the manner in which it was heralded, and its price, the public was led to expect an exhaustive treatise on the dog; and moreover, more especially on the American sporting dog, and in no sense is it such.

Of the 201 pages of which the book is composed, 55, or over one-quarter are taken up with pedigrees, and these, of which there are 332, 10 or over ten per cent. consist simply of the name of the dog and owner, with the remark "No pedigree reported." Two of these, I see, were prize winners, but what the value of the other 38 is I cannot conceive. The chapter on breaking is excellent, not too much spun out, but giving clear and easily understood, practical instruction, by following which any person of moderate intelligence and patience could do much to break his own dog. It is evident that the author is herein a congenial field, and he writes as one having put his maxims to the test of practice. The chapter on breeding is good as far as it goes; but there are some important topics not touched upon, as the best time of year to have a bitch served, during what part of her heat period, and whether it is best to have her served more than once. Also nothing is said of what points should be looked for in selecting those pups of a litter to keep, when you do not wish to raise all. The account of the most common diseases and their treatment is taken almost *verbatim* from Mayhew, and nothing is said of the parasitic origin of mange, and its contagiousness is merely mentioned incidentally.

Although the Laverack and Gordon strains are mentioned, no account is given of the means that were taken to get at the present stock, nor are we told what the points are which have been endeavored to be brought out in these strains, nor is any stress laid on the fact of English breeders striving to get a class of dogs in whom almost everything is sacrificed for pace, while for our shooting, except perhaps on the prairies, pace is only of a secondary importance.

I do not want to appear hypercritical, but much as I have found to admire in the book, I must confess that I was disappointed, and can only say that if "Guido" paid $4.50 for his copy, as I did for mine, and was satisfied with his bargain, money must be much easier earned in Memphis, Tenn., in the profession or occupation which he adorns, than it is in following in the steps of Esculapins in the modern Athens.

DOCTOR.

WARTS IN A DOG'S MOUTH.

ITHACA, N. Y., May 15th, 1876.

EDITOR FOREST AND STREAM:—

Some years ago I had a young setter whose lips and tongue were a complete mass of warts. He could not lap water except by plunging into it so as to get the whole mouth under water. He couldn't pick up any food. I fed him by dropping into his open mouth, and mostly down his throat, strips of "hasty pudding." I knew that warts upon the human subject had been cured by taking a homeopathic preparation of arbor vitæ, or white cedar. I made a strong decoction of the leaves of this cedar and dissolved in it a little borax and a little brown sugar. I made a swab, and three times a day swabbed the dog's mouth and lips. Of course he swallowed a good deal of it. In order to make the application effectually and conveniently, I required the dog to leap upon a platform about a yard high and charge so that his four paws would hang over the edge of it. I then made him hold up his head and open his mouth. He didn't like the performance at first, but soon came to be pleased with it, and when he saw me coming with the tools he would run and put himself in position for the operation with every sign of joy, and as if he was satisfied it would do him good. In about two weeks the warts began to slough off, and in a month were substantially gone. They left some scars, and the tongue was always a little cramped on one edge. Whether the cure was the result of the treatment I cannot say. At all events the cure followed the treatment; and that's about as much as any of the doctors can say.

H.

ANNOUNCEMENT.

OUR BIRDS OF PREY.—Henry J. Vermer, field geologist of the Canada Survey, has in press a work on the eagles, hawks, and owls of Canada. It is founded upon his own observations, and is said to be filled with new and original facts relating to the distribution, habits, and nidification of these birds of prey. It also contains the observations of recent American writers on several species concerning which there has been much controversy. Fifteen specifically distinct falcons and hawks, three eagles, and ten owls are described. The marked feature of the work is the thirty large photographed plates of the birds mentioned. These plates are described as "minutely accurate portraits," and are said to be well done that, with the aid of a magnifying glass, even the texture of the different parts of the plumage and all minute specific details may be made out. The work is published by Dawson Bros., Montreal (price $12) and when it appears we will notice it more extensively. Meanwhile orders for it are solicited.

HOW TO COOK A TERRAPIN.—Put him in boiling water for five minutes, to loosen the skin; then take him out, skin him, and replace him in the hot water. When the claws become soft it is sufficiently boiled. Take him out and remove the bottom shell first, cut off the head and claws, and take out the gall and sand-bag, then cut up the remainder. Cut the entrails into pieces about half an inch long. Be careful to preserve all the juice. Put in a stew-pan, make a dressing of flour, yolk of two hard-boiled eggs, a third of a pound of the very best butter, a proper proportion of salt, red pepper, a large wine-glass of Madeira or sherry (to each terrapin), and a small quantity of rich cream. All of the ingredients to be of the best quality. Dish promptly, and serve smoking hot. The cow terrapin is the best, besides furnishing eggs, which are a great addition. Some persons have been known to season with spices, but this is not to the taste of epicures.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

I. S., Boston.—Is there any woodcock shooting in neighborhood of Calias, Me., in its season? Ans. We know of no reason why there should not be.

E. D. H., Allentown.—I am anxious to try one of Seth Green's needle points, and do not know where to get one? Ans. Address Seth Green, Rochester, N. Y.

W. R., New York.—Will you kindly inform me where I can buy a Gordon setter dog, (black and tan), well trained, and price? Ans. Address H. Smith at this office.

G., Harrisburgh.—Who makes "shoe-packs," such as Frank Good made for a couple of years back? He has discontinued the business. Ans. Thompson & Sons, 338 Broadway.

WALTER, Binghampton.—Where can I get a pocket map of the Magog District in Canada? Ans. Smith & Co., St. Johns, Province of Quebec, and Roberts & Co., publishers, Montreal.

F. S. R., Minneapolis.—What kind of cement would you advise me to use in constructing a small aquarium? Ans. Use regular aquarium cement, to be purchased of dealers in aquaria goods.

G. W., West Meriden, Conn.—Can you inform me through FOREST AND STREAM what it costs to take dogs in Florida by steamer, providing the owner goes with them? Ans. About five dollars.

W. B. S., Cincinnati.—I take the liberty of writing for some areca nut for a fine skye terrier pup which is troubled with worms? Ans. Have mailed to you the proper quantity of areca nut with directions for giving it.

CANADIAN CORRESPONDENTS.—Thanks to many residents of the Dominion for notes of current events and general matters of interest. The FOREST AND STREAM devotes more attention to Canada sports than all United States papers combined.

PIGEONS, N. Y.—Is there any book that treats on the breeding and raising of pigeons; if so, where can it be had, and what is the price of it? Ans. Moore's book on pigeons, price 30 cents; to be had by addressing "Fancier's Journal," Hartford, Conn.

BISMARCK, Hackettstown, N. J.—Give, if convenient, in your next issue, the pedigree of Nannie, a slut that has served several times, owned by George Suttle, of Philadelphia? Ans. We have not the pedigree of Mr. Suttle's bitch. You can no doubt get it by writing to him.

M. G., New Haven, Conn.—Please tell me the best and shortest route to Lake Pleasant, Hamilton county, N. Y. Ans. Take stage from Amsterdam on N. Y. Central Railroad, every Wednesday and Saturday, distance 53 miles. Bay Wallace's Adirondack Guide, for sale at this office, price $2.

C. P., New York.—Will you be kind enough to inform me about the snipe shooting at Moriches, on Moriches Bay, L. I., and also Bellport, and as to the accommodation at both places. Ans. Snipe shooting (bay birds) uncertain, but sometimes excellent after July 1st. Good accommodations at both places.

A. P. S., Troy, N. Y.—Will you be kind enough to inform me of the dose, time and manner of administering areca nut to a six pup from 8 to 9 months old, for worms? Ans. Give him 30 grains of powdered areca nut in two doses three hours apart, and about four hours after giving the last dose give him ½ oz. castor oil.

SCULLS.—I see Fenner's boat advertised in your paper. Can you recommend it? What is it like? Is it better than Hegeman's? Ans. It is a canvas and frame boat, something on the principle of Hegeman's, and can be gotten ready for use in five minutes. We have sent you a circular. The largest is 16 feet long and will carry five persons.

G. R. B., Buffalo.—Will you oblige me by stating where I would be likely to procure a Clumber spaniel. Must be a young dog, well broken to the gun, and a good retriever? Ans. Mr. B. Smith, of Kentville, N. S., has the purest strain of Clumber spaniels in this country. By addressing him you may obtain a puppy and, possibly, a broken dog.

C. A. R., Addison.—Will you be kind enough to answer through your paper what table of denomination is used in weighing charges of shot and powder for rifles and shot guns? Ans. Shot is weighed by avoirdupois, 16 drachms one ounce, 16 ounces one pound. Charges of powder are *measured* by an arbitrary scale, which might be termed powder measure.

C. A. S., Salem.—Will you please inform me where, within 50 to 75 miles of Boston, good shooting can be had at all kinds of small game, and what it will cost to get there? Can good shooting be had at Plymouth, and what kinds of game? Ans. No game shooting until fall; you may find some hay bird shooting near Plymouth during the summer and quails in the fall.

F. G., Milwaukee.—Will you please tell me the address of some persons of whom I can obtain the eggs of the silkworm, also how much they would be, and where I can get a book on their culture? Ans. Joseph Newman, now at the Centennial Exhibition, can probably give you more information than any man in America. Prevost's book, published in 1869 in San Francisco, will suit you.

J. S., Catskill, N. Y.—Will you please inform me the highest average ever made by any rifle club (of 6 men) in this country; distance, 500 yards. Please give me the name of the club and location? Ans. We have no time to search the record, but presume that the score of 564 points out of a possible 600, made by the Partisan Club of Hodson, last week, is the highest *team* score ever made in a match.

B. A. M., Brooklyn.—Will you please inform me how I can keep or straighten a gut leader, it being a new one, from curling up? Ans. Use a piece of India-rubber. The best bait for bass, catfish and flounders? Ans. Crabs and clams and shrimps. Can good flounder fishing be had in the Harlem, and at what part? Ans. Off the boat-house floats or between the railroad bridge and Mocomb's Dam.

E. J., Wethersfield.—Can you give me the pedigree of Saltus' Dash, and do you know anything about the slut of Wm. Hudson, of Manchester, Conn.? Ans. Dash was by Gubser's, afterwards Bob Robinson's Jack, he by Putnam's Dan by Paul Meade's old Dash. Dash's dam was Frisk by Louis Schwartz's Irish dog, also of the Paul Meade stock. Frisk's dam was Duck. We do not know Mr. Hudson's slut.

EVERLY, Philadelphia.—1. Will you please inform me how to preserve shad roe? 2. If there is anything which I can mix with it, so as to keep it on the hook, and yet be as good a bait and taken as readily. I believe I can take twice as many perch with this bait as with any other perch bait? Ans. 1. Salt it. 2. Pass the hook through the roe, and tie it on with pack thread; or you can envelope it in a piece of mosquito netting.

F. FRANKLIN.—1. What is the best way to catch lake trout, and in what book will I find the most information? 2. Is the fishing good just south of the Adirondacks? Ans. Lake trout, *Salmo confinis*, are common to nearly all our interior lakes, and are now caught by trolling with spoon or gang on the surface. In six weeks they will be on the bottom and can only be caught by deep trolling or still fishing and "chumming." Norris, Roosevelt, and Scott all give instruction.

A. C. J., Indianapolis.—Several gentlemen of this city, contemplating the construction of a fish pond, have requested me to write you for the purpose of ascertaining the address of a person of experience (whom you could recommend) to supervise the work and take charge of the pond after its completion. Ans. Write to N. W. Clark, Charlestown, Mich.; Thompson & Tagg, New Hope, Bucks county, Pa; or to Milton B. Pierce, Wenonah, N. J., all skilled fish culturists.

CHAS, Cleveland, Ohio.—Before purchasing a boat for general sporting and marsh use, I would like your opinion (through you columns) of Bond's patent section boats. What do you think of their durability under hard usage, and how do they compare with wooden boats for general usefulness, strength, &c.? Ans. For ordinary work they answer very well, but are more difficult to repair when perforated than wooden boats. See Dr. Kenworthy's article on Metal Boats, in Yachting column this week.

SUBSCRIBER, New York.—Will you please let me know where I can get during my vacation (from the 1st to the 15th of July) some fair snipe shooting? I do not wish to pay over six or eight dollars a week for board. How would Montauk Point do? How do you get there? Ans. At Good Ground, Sayville, Patchogue, Bayport, or any of the towns reached by the Central or South Side Railroad. You may obtain board at $8 per week. Montauk Point is reached by Long Island Railroad to Sag Harbor, thence by carriage.

C. H. L., Boston.—Do you consider the fishing in the brooks in the vicinity of Sandwich, southern part of this State, sufficiently good to warrant a stay of two weeks or thereabouts? I have heard, indirectly, that good fishing can be had there. Ans. Barnstable county is filled with natural trout streams, where strings of fish can often be taken, but they are much fished. The streams in the vicinity of Sandwich, as well as those of Wequoit, across the neck, are of this character. You might go to worse places than Sandwich.

GEORGE, Rochester.—Will you please inform me where I can obtain the best map of the Adirondack Wilderness, and by whom it is published? Ans. Ely's improved map is combined with Wallace's Adirondack Guide, of which we now hold the copyright. The map separately can be bought at Colton's, map publishers, 172 William street, city. The map with book can be bought at FOREST AND STREAM office for $2, and contains all possible information relating to the Adirondacks. It is, in fact, the only thorough guide to be had.

T. D.—Can you guarantee me one elk next September in Minnesota? Which is the best county for shooting? If no shooting in Minnesota, where do you advise me to go? Ans. Elk are still abundant in the northwestern part of Minnesota, but the best hunting grounds are in Kansas and Nebraska. For Kansas see letters in FOREST AND STREAM May 4th and 11th, this month. The Loup Fork, of the Republican River is a grand elk ground in Nebraska. Leave the Central Pacific Railroad, at a point 126 miles west of Omaha, and strike out.

W. T. R., New York.—1. Will you please tell me whether gun barrels built with the ordinary bore, and afterwards choked, either by boring or swedging the muzzles, as is done by some gunsmiths, are likely to retain the new shape after any considerable amount of use? 2. Also, do you think that the wearers of the various styles of duck hunting suits now in use are subjected, in perspiring or wet weather, to any danger arising from the nature of the solutions with which the suits are impregnated for the purpose of rendering them waterproof? Ans. 1. Yes. 2. No.

A. J. W., Boston.—A large number of my friends are interested with me in knowing all we can learn of Alachua, Marion, and Sumter Counties, Florida. Many settlers have gone from this State to those counties. ex-Governor Fenton, of your State, spent last winter at Gainesville, in Alachua County. Is that a good orange region? Are fish and game abundant? Is the county healthy? What is the price of land? Ans. By referring to an advertisement on another page, headed "Florida—40 acres for $50," and addressing a letter to the General Agent, all your inquiries will be correctly and intelligently answered. Col. J. B. Oliver is the General Agent, and his address is No. 361 Fulton street, Brooklyn, N. Y.

COLLEGIAN, Orange, N. J.—1. I want to build a boat for making short excursions, say up the Hudson from New York to West Point. I would also like to use the boat for gunning, sailing and moving. Where can I see one of the Barnegat sneak boats? What hook or paper gives dimensions, etc.? Also what book on canoeing gives the most information as to dimensions, etc.? 2. I have a 10-bore breech-loader which I do not like, and would like to change it for another. Do you know of any dealer who would make the exchange, and which do you consider the best for general use a 16 or 12-bore gun? Ans 1. The Barnegat sneak boat would answer your purpose. See our paper of March 2d, 1876, and March 19th, 26th, and April 23d, 1874. 2. We do not know of any dealer who exchanges guns, and prefer the 12 gauge for general shooting.

G. A. A., Hillsboro, N. B.—I have a ball terrier pup four months old, and on his head, under his chin, and all over his chest are numbers of little pimples, and the skin looks red and the hair is coming out; dog seems quite smart, and eats well. I concluded he has the mange, but cannot get any compound sulphur ointment, (which I see you recommend) as the druggist here says he didn't know what it is. Could you give prescription for it or something else easily procured? Ans. Take rosin ointment two ounces; add to it flour of sulphur enough to make the rosin ointment very thick, then add spirits of turpentine to make a proper consistency; to be well rubbed into the skin. Wash the parts affected occasionally with Castile soap and water, and when perfectly dry rub the ointment well into the skin. Give the dog exercise, and feed no meat for a while.

W. H. S., Philadelphia.—1. What is the standing of Edwinson C. Green's guns? Do they use both paper and metal shells? 2. Is an $85. Remington shot gun as good a gun as an English gun? Do they shoot as well, and is the material and fitting as good as a Green? 3 Would you advise buying a Remington gun? Are they choked-bored, and if not, could you have it done, and would the gun be as good as one that was choked when it was made? 4. Does the Remington gun use both paper and brass shells? and does the gun wear well? Ans. 1, The E. C Green guns are considered good, and both paper and metal shells are used with them? 2, The Remington gun is quite as well finished as any English gun at the same price, and no gun shoots better. 3. Many of the Remington guns are choke-bored, and consequently they shoot very close. You can purchase them choke-bored or not, as you wish. 4. They shoot both paper and metalic shells.

R. S. R., Philadelphia, Pa.—1. In fly-casting contests is the measurement made on the ground (or water) from the position of the caster to the point where the fly falls, or is the line measured? If the latter is the case, is the measurement made from the reel or from the tip of the rod? Are the rods of the contestants allowed to vary in length, or the lines in weight? 2. What is an "express" rifle? Ans. 1. Measurement of distance is from hat of rod to end of leader or casting line. In contests a buoyed line is laid on the water, with five feet intervals between the corks, and the measurement is taken from where the caster stands to the point along the buoyed line where the fly falls. Rods and leaders are both limited in length, to not over 12 feet, and not over 8 feet respectively. 2. An express rifle is a small-bore rifle, generally a 32-calibre, with a flat trajectory and a point-blank range extending to 130 or 140 yards; one sight only being taken, and a full fore sight for distances of 200 yards or within sporting range.

WILFRID, New York city.—I desire information regarding the "Winnimish" fishing at outlet Lake St. John, of which, mention was made lately in your journal—4th inst. What are the average flies? Can those waters be rivalled of, free, by Americans? Is it necessary to camp out, and can reliable canoemen be found there? Ans. About middle of June take steamer on a Saturday for Quebec to Chicoutimi on Saguenay River, where there are comfortable taverns. You will find steam conveyance on a tug to the Upper Saguenay. Go to Savard, the Frenchman, and engage a canoe and two men to take you to the camping ground at the "Grand Discharge," five miles above. You can troll for big pike while going up. Sleep at the foot of the Rapid de Gervais. Next day cross the rapid and fish for winnimish (or land-locked salmon,) about a mile up the river at the top of the rapid. The men will show you an island, near which lies a rock. Fish off that rock. Next day go up the main branch of the river to another place and return so as to be at Chicoutimi by Wednesday or Saturday afternoon. Take medium sized flies—yellow; black wings and yellow body; gray; red body and grey backle; brown wings and black body; these are the best colors, the yellow and black prevailing. You can find all this, and more too, in "Hallock's Fishing Tourist," for sale at this office; price $2.00. "No angler should be without one." By the way, is not this a tolerably complete answer to an anonymous querist? See standing rule at top of this column.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, JUNE 1, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us be lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Editor and Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, June 1st.—Trotting: Mystic Park, Boston; Belmont Park, Philadelphia; Le Roy, N. S.; Madison, Ind. Rifle: First competition for places on International Team, Creedmoor. Base-Ball: St. Louis vs. Athletic, at Philadelphia; Chicago vs. Boston, at Boston; Cincinnati vs. Hartford, at Hartford; Louisville vs. Mutual, at Brooklyn.

FRIDAY, June 2d.—Trotting at Mystic Park, Bostoo, and as above.

SATURDAY, June 3d.—Racing: Jerome Park. Trotting: Mystic Park, Boston. Mystic Boat Club Regatta, Passaic, N. J.; Athletic vs. Triton, four-oared race, Passaic. Base-Ball: St. Louis vs. Athletic, at Philadelphia; Chicago vs. Boston, at Boston; Cincinnati vs. Hartford, at Hartford, Louisville vs. Mutual, at Brooklyn.

MONDAY, June 5th.—Trotting: Belmont Park, Boston. Rifle: Schnalzen Park, Jersey City. Pigeon Match for Championship: Bogardus and Dr. Talbot, Philadelphia.

TUESDAY, June 6th.—Racing: deroma Park. Trotting: Belmont Park, Philadelphia; Dubuque, Iowa; Nudina, N. Y.; Washington, D. C.; Beacon Park, Boston. Rifle Shooting: Schoetzen Park, Jersey City. Atlantic Yacht Club Regatta: Jersey City Regatta. Pigeon Tournament St. Paul, Minn. Base Ball: Louisville vs. Boston, at Boston.

WEDNESDAY, June 7th.—Trotting as above. Second competition for places on International Team. Yale athletic sports. Pigeon Shooting Tournament: St. Paul, Minn.

ANNOUNCEMENT.—Mr. Wm. C. Harris having resigned the office of business manager of this paper, to devote his attention to the publication of his Philadelphia papers, the *Manufacturer's Trade Journal* and *Grocer's Price Current*, the editorial and business management of the FOREST AND STREAM will from this date be under the sole charge of Mr. Charles Hallock, its original proprietor. Mr. Harris still retains his interest as stockholder in this paper, and will be pleased to welcome our readers at "The Hunter's Camp," in the Centennial grounds.

The Philadelphia branch office is discontinued, and there will be no other office than the present general publication office at 17 Chatham street, New York.

—A bill to prohibit the sale of intoxicating liquors within four miles of the California University is called by a San Francisco paper, "An act to promote pedestrianism among students."

—The next convention of the New York State Sportsman's Association, and the annual State shoot will be held at Syracuse.

STATE SPORTSMAN'S CONVENTION.

THE BUSINESS PROCEEDINGS.

THE Eighteenth Annual Convention of the New York State Sportsman's Association was held at Geneseo in Livingston county last week, under the auspices and direction of the Livingston County Sportsman's Association. To call the meeting a success merely, would but feebly describe what in reality was a very delightful and harmonious re-union of sportsmen from every section of the State. The first meeting had been called for Monday evening, and at an early hour of that day the lovely, but quiet little village of Geneseo, began to bustle with the rapid arrivals of delegates and associate sportsmen, and the hotels became thronged with the constantly increasing crowd. The New York delegation arrived about noon, and were quartered at the Robinson House for meals, with rooms in adjoining private houses, an arrangement which we found subsequently conduced largely to repose. At half past eight o'clock in the evening, about two hundred delegates and associates had assembled in the Court House, the convention being called to order by Mr. Jas. W. Wadsworth, President of the State Association, who in a short speech, on behalf of the citizens of Geneseo, welcomed them present, and called for the order of business. Upon the roll being called, the following clubs were found to be represented:—

Le Roy Sportsmen's Club—James Annin, Jr., C. F. Bissell, D. Menzie, Eugene Wakeman, Rondolph Ballard.

Mohawk Game Club, West Troy—N. Rowe, E. A. Meeeely, J. E. Glass, Pater Ray.

Dansville Sportsmen's Club—H. J. Faolkner, John Hyland, L. Kuhn, W. G. Thompson, D. Hulburt.

Niagara Falls Sportsmen's Club—J. W. Whitmar, S. P. Young, H. E. Griffith, Dr. A. C. Crysler, W. H. Brewer.

Monroe County Club, Rochester—W. J. Babcock, A. B. Lamberton, C. E. Rider, H. L. Brown, Eugene Pond.

Jordan Sportsmen's Club, Jordan—Alfred D. Lawis, Charles E. Bert, J. W. Stewart, D. A. Sperry, Wm. C. Graves.

Geneseo Sportsmeo's Club, Irondequoit—E. S. Phelps, John Evers head, G. W. Crouch, Jr., George Hartman, W. A. Lyon.

Central N. Y. Sportsmen's Club, Utica—Hamilton Busboy, Charles R. Weed, Charles W. Shapley, John J. Flanagan J. H. Acklen.

New York City Association for Protection of Game—C. DuBois Wagstaff, Col. Alfred Wagstaff, Jr., Matthias Nicoll.

Riverside Sporting Club, Buffalo—John Gibson, W. Dolley, William Mugridge, William Renowden, J. F. Clarke.

Forester Club, Penn Yan—W. B. Sheldon, H. D. Pratt, W. W. Quackenbush.

Rochester Sportsmen's Club, L. H. Grevar, F. W. Little, H. J. Bobcock.

Skaneateles Club—George Rawlins, Asa L. Sherwood.

Album Rifle and Sportsmen's Club—P. R. Taylor, George S. Hutchinson, George Waterman, N. S. Lathu, Wm. Ramedale.

Wayne County Sportsmen's Club, Clydo—James M. Carry, James M. Streeter, Henry Wood, Benj. Catchpole, John Hill.

Phenix Sporting Club, Seneca Falls—Moose Romsey, Horace Silsby, W. S. Murray, Z P. Case, Wm. Lawrence.

Dean Riebmond's Sportsmen's Club, Batavia—A. R. Warner, O. C. Parker, A. N. Condia, Henry Todd, D. W. Tomlinson.

Buffalo Audubon Club—Charles A. Taber, W. N. Lawson, James Franklin, Jr., James Rafferty, Gen. J. R. Wines.

Central City Club, Syracuse—James Manning, G. W. Edwords, Howard Soule, G. W. Baxter, Jr., Frank Denison, M. A. Mahew.

Queen City Club, Buffalo—J. Oehmig, Chas. Stein, Philip Voltz, Geo. Stalver, Geo. Stanber, William Stewart.

Onondaga Club, Syracuse—J. Bedford, W. S. Barnom, T. E. Townsend, Thos. Kimber, Jr., Thos. Brazille.

Jefferson Sportsman's Club, Watertown—Dr. W. R. Trowbridge, G. W. Fowler, H. W. Sandforth, W. L. Porter, L. Phelps.

Livingston Sportsmen's Association—W. W. Bishop, R. A. Kneeland, G. W. Barney, Jr., W. A. Stevens, Wm. Willard.

Audubon Club, Rochester—A Brownell, H. C. Daniels, E. B. Pope, N. Tomlinson, Wm. S. Markell.

Forester Club, Buffalo—Dr. R. V. Pierce, Geo. Smith, H. R. Jones, Geo. H. Van. Vleck, Jonathan Sidway.

The minutes of the last meeting having been read and approved, the following clubs were admitted to the State Association: Lima Sportsman's Club, of Lima; Geneseo Sportsman's Club, of Geneseo; Mount Morris Sportsmau's Association, and the Otsiningo Club of Binghamton. A motion was made to admit two gentlemen from Steuben County as County Delegates, in accordance with simular action on previous occasions, but in the discussion which followed it appeared that although mention was made in the by-laws of County Delegates no provision had been made in the constitutiou for their admission. A motion to admit the gentlemen from Steuben county, as well as another present from Chatauqua county, (these counties having no regularly organized clubs) was lost, and in order that this question might be friendly decided and placed in proper shape, it was moved by Mr. Flanigau, of Utica, that the constitution be amended so as to admit county delegates, which was referred.

After an invitation from Mr. Kidder M. Scott, President of the Livingston County Sportsmau's Club, to partake of the hospitalities of the club at their rooms, the meeting adjourned.

The pigeon shooting commenced at an early hour on the following morniug, the trains from Rochester and Buffalo bringing in au additional number of sportsmeu. A full record of the shooting will be fouud in its appropriate column with the scores and awards. The morning opened cold and disagreeable but by noon the sun appeared and from that time until the close of the meeting the weather could not have been improved. As the shooting was continued as long as the daylight lasted, it was after nine o'clock before the delegates again assembled in the City Hall. The minutes of the previous evening's proceedings having been read, the question of County Delegates was again taken up. Mr. Flanigan, of Utica, after explaining that his motion of Monday night was made merely to bring the subject before the convention, moved that all reference to county delegates be stricken from the by-laws. The resolution was referred to a committee whose report will be acted upon at the next meeting of the Association. Mr. Henry Bergh, the irrepressible, through Mr. Flower, of Watertown, presented a letter to the Association asking for co-operation at the next session of the Legislature in procuring more stringent laws relating to the peculiar province of the society of which he is President. Mr. Bergh's animus appears to be particularly directed towards those who kill tame pigeons for the purpose of deciding illegal wagers. The letter was referred to a committee of two, consisting of Messrs. Flower and Lamberton.

Col. Alfred Wagstaff, chairman of the delegation from the New York City Sportsman's Club, asked for a committee of five to be appointed for the purpose of going to Albany during the next session of the Legislature to endeavor to have suitable game laws passed. In support of his motion Col. Wagstaff read a letter from Mr. Royal Phelps, President of the N. Y. City Club, alluding to the work of his society and asking for the co-operation of the State Association in preventing the illegal sale of game. Col. Wagstaff detailed the efforts of the club to effect a revision of the game laws, and alluded to the strenuous efforts made by market-men to have the section referring to the sale of game and fish out of season so altered as to permit them to sell it at any time upon their producing proof of its having been killed within the open time. He also alluded to the fact that the Game Committee of the Assembly had reduced the penalties for violations of the law. Mr. Taber, of the Buffalo Audubon Club, stated that he was a member of the Game Committee of the last Assembly, and that the committee had earnestly desired to present the best laws relating to the protection of game. But they found that there were conflicting intervals; that the market-men had rights as well as the sportsmen. In support of the reduction of the penalties he stated that it had been found difficult to collect large fines and that they had been reduced accordingly. Col. Wagstaff in replying, alluded to the work which had been done by his club in prosecuting illegal sales of fish and game. New York was the great market for the State. Abolish watchfulness there and the whole State would suffer, and under false invoices game would be sold openly and defiantly at all seasons. Mr. Taber's remarks, although eloquently delivered and received with applause, were wanting in argument. As we shall refer to this matter at length on another occasion we leave it here for the present. Mr. Phelps' letter was as follows:—

NEW YORK, May 20th, 1876.

To the President of the New York State Association for the Protection of Fish and Game, Geneseo, New York.

SIR:—I am requested by the New York City Association for the Protection of Game, over which I have the honor of presiding, to state to the parent State Association, about to assemble at Geneseo, how great has been its mortification and disappointment that the Committee on Game Laws of the Assembly should have amended Senate Bill No. 86, introduced by Mr. Kennaday at the request of this association, by adding to it the following section:—

"SECTION 6. In any prosecution or trial under the provisions of this act of any person for having in his possession any quadrupeds, birds, fish, or shell fish in the months or parts of months when by law he is forbidden to have the same, it shall be lawful to be shown in evidence that the quadrupeds, birds, fish, or shell fish in question were taken or killed within the time prohibited by law, or were not taken or killed within this State; and such evidence, when deemed sufficient by the court having jurisdiction of the offence alleged, shall be a sufficient defence to such action."

This section, and the amendment introduced in Section 36 in relation to search warrants, are undoubtedly the work of the lawyer sent up to Albany by the great game and fish dealers of the New York markets, and had they become a law this association might as well have dissolved its and game throughout this and the other States in the Union; and it complains that it has not been supported in the Legislature at Albany as it deserves.

The market-men of this city are wealthy and determined, and unless the members of the different game preserving associations throughout the State are united and active they will get such amendments to the game law as will enable them to sell game and fish in this city the whole year round. They are fighting this association on the constitutionality of the game law in prohibiting the sale of game and fish during the close season when brought from another State, or from Canada. Up to this time we have beaten them in every State court, but they say they will take the case to the Supreme Court at Washington.

So far as our law suits and prosecutions under the existing game laws are concerned we propose to take care of ourselves; but we invite the co-operation and assistance of our fellow associations throughout the State to aid us in defeating if the next Legislature all such disastrous amendments as those above referred to, and in securing such proper amendments as are generally conceded to be necessary, and as united action is always the most effective we beg leave to suggest the propriety of having a committee appointed by the State Association in charge of which this matter of amending the game laws may be placed, and with which we may place ourselves in communication. ROYAL PHELPS,
President New York City Association for the Protection of Game.

The last action of the convention on Tuesday evening was the appointing of the place at which the next convention should be held. The claims of Utica, Buffalo, Niagara Falls, and Syracuse were respectively argued, and an informal ballot showed for Syracuse 53 votes, Buffalo, 28, Niagara Falls, 27, Clyde, 2, and Skeneatelas 2. The Buffalo delegation then waived their claims in favor of Niagara Falls, and a formal ballot being taken, Syracuse received 61 votes and Niagara Falls 56. The selection of Syracuse was then made unanimous.

The business meeting on Wednesday evening was called to order by President Wadsworth at 9 o'clock. Treasurer S. M. Spencer, of Rochester, reported the amount in the treasury $875. Col. A. Wagstaff, of New York, of the committee on the letter from Hon. Royal Phelps regarding the game and fish laws, reported in favor of the suggestions therein. The Committee on Delegates to the National Convention at Chicago reported the following: C. C. Morse, of Rochester, John J. Flanagan, of Utica, James Manning, of Syracuse, J. M. Wilmer, of Niagara Falls, Col. Wagstaff, of New York. Col. G. W. Flower, of Watertown, reported on Mr. Bergh's letter, signifying the wish of the associations to aid all proper measures for the prevention of cruelty to animals. The chairman appointed Col. A. Wagstaff, of New York, Royal Phelps of New York, J. B. Sage, of Buffalo, A. B. Lamberton, of Rochester, and George W. Edwards, of Syracuse, as a committee to visit the Legislature on Game Laws.

The following officers were elected for the ensuing year: President, Greene Smith, of Syracuse; First Vice-President, W. J. Babcock, of Rochester; Second Vice-President, Col. A. Wagstaff, of New York; Recording Secretary, John B. Sage, of Buffalo; Corresponding Secretary, George A. Edwards, of Syracuse; Treasurer, S. M. Spencer, of Rochester. Col. Fowler moved a vote of thanks to President Wadsworth and his associates for courtesy and liberality to the association, which was carried enthusiastically. Adjourned *sine die*.

The reports of the pigeon shooting, fly casting, rifle and pistol shooting, and Bench Show of dogs will be found in their respective columns.

FULTON LAKE PARK ASSOCIATION.—This association, to which we alluded to in our last issue, was formally organized last week, at a meeting of the corporators at Geneseo last Saturday succeeding the State Sportsman's Convention. The officers chosen are as follows:—

President, Gen. R. U. Sherman, of Utica; First Vice-President, Major Thomas McCarthy, of Syracuse; Second Vice-President, Hon. James Faulkner, of Dansville; Treasurer, A. B. Lamberton, of Rochester; Secretary, Gen. R. M. Richardson, of Syracuse; Executive Committee, the President, First Vice-President, Treasurer and Secretary, *ex officio*, H. H. Thompson, of New York, C. N. Ross, of Auburn, C. C. Morse, of Rochester. Constitution and By-Laws were adopted and subscription lists for a limited amount of stock only will soon be circulated.

GAME PROTECTION.

HOUSE OF REPRESENTATIVES,
WASHINGTON, D. C., May 24, 1876.

EDITOR FOREST AND STREAM:—

I think we should make an effort to stop the exportation of grouse, &c. So many of them are sent abroad during the winter. I have thought that perhaps Congress might be induced to put an export duty on game birds. Could you not get up a petition to this effect. Also can you in any way ascertain how many grouse are sent abroad each winter. If some of you in New York will do this at once I will do anything I can here. Please submit it to some of our friends and see what may be accomplished, and it should be done at once. I. V. LE MOYNE.

We are very glad to hear from our worthy correspondent, who is President of the National Sportsmen's Association, and to know that he is so earnest in the good work of protecting game. His ardor should stir the members of the Association to active efforts, and at the coming Convention at Chicago in August, nothing can occupy the attention of delegates with more profit than the discussion of the abuses referred to in the foregoing letter and the adoption of measures of protection and cure. The Convention sits at the great metropolis of the grouse country, where intelligent information can be made available in its application to the care in hand, and it should be its especial duty to prevent the trapping of birds in the West and their transportation out of season, and even their exportation, if necessary, as is even now done in Florida. We at the East, especially in the great markets of New York, Boston, and Philadelphia, will police this end of the line, and see that no game is sold out of season here; but the law does not permit the seizure of birds *in transitu*, even though hundreds of barrels are on our wharves awaiting shipment to Europe.

The editor of this journal personally brought this grievance or abuse to the attention of the New York Society for the Protection of Game, a year ago last winter, and while little could be done here, it was ascertained that one of the principal Western shippers was a P. B. Weare, of Chicago. Speculators provide farmers all along the railway line with ammunition and snares, paying a trifling sum per pair for birds delivered to agents at certain stations on the railroads. These agents are usually railroad employees, and attend to the shipment and forwarding of the game. It is impossible to obtain, even from invoices, an approximate estimate of the number of unseasonable birds shipped to Europe from any given point. We know that we found 178 barrels of grouse, or prairie chickens, at a single pier on the North River, on a given day, and a Mr. F. J. Bosworth, of Brighton, England, then informed us that consignments were arriving there by tons. The winter just past was so mild that very few birds were shipped, and possibly the intervention of the game societies at either end of the underground line had something to do with it.

We come now, in the following paragraph, to the very pith and marrow of the case in point, as taken by Mr. Le Moyne. Kansas has taken the initiative among Western States in prohibiting the exportation of game from the State. The provisions of its new law, if at all enforced, will save a great deal of game; but if it is not, fine shooting will soon be of the past in that State. Grouse last season netted the shooter $4.00 a dozen; consequently everybody that could shoot or trap engaged in it as the most profitable pursuits. We find in the Easton, (Pa.) *Free Press*, the following reference to the new law:—

"The Western people realize the importance of their game interests, and have legislated, through the instrumentality of the Game Associations, in various ways for its protection. But legislation, so far, has no more than protected it in the close season by cutting off its market. But as the market offers the chief inducement for the destruction of game, and the open season is a long one—from four to six months—it follows that the market is the greatest enemy that game has. The natural increase would more than restore that destroyed for pleasure or home purposes, but cannot repair the inroads made upon it for the market supply, hence there has been and will continue to be a steady decrease in the quantity of game until this main cause of decrease is materially abated or done away with altogether. I stated previously that during the shipping season, from 2,000 to 3,000 grouse were shipped per week from the little town of Chetopah, Kansas, alone, and from this may be realized the immense drain made upon game throughout the State. Laws against trapping have been in force, but they have been practically null, either from an indifference to, or difficulty of, enforcing them, and the real benefit from all the game laws has come, as I have said, from closing markets to the sale of game out of the prescribed season. Kansas enacted a new game law, which was approved and went into force on the 23d of last February. It has some good and some weak features, but its main provision, if even partially carried out, will undoubtedly preserve a great quantity of game from destruction. The law makes it a penal offence to kill game out of season (grouse between January 1st and August 15th, and quail between January 1st and November 1st); also for a person to hunt upon other than his own premises without the owner's permission. It allows persons to trap, net or snare game on their own premises. This section is probably a result of the numerical power of the Grangers in the Legislature. It certainly could not reflect the views of any game association. Its important provision makes it unlawful for any express or railroad company or any common carrier *knowingly* to ship or transport (or to receive for that purpose) any game to points in or out of the State. The penalty to companies is $100, and to agents of companies from $10 to $50, for each and every offence. The penalty does not apply to game in transit through Kansas from other States and Territories. The law will be evaded by those living near the borders shipping game from points out of the State, and may be evaded by companies not curiously inquiring into, and therefore not *knowing*, the character of shipments. But a reasonable enforcement of this section of the law will undoubtedly cut off what has been and can be the only cause of a decrease of game in this State, where the winters are not severe enough to destroy it. The new law does not provide for any portion of the fines to go to the informer, and so an informer will have to act disinterestedly or in the interests of game, unless he have some malice to gratify."

—The Central New York Sportsman's Club, of Utica, has been stocking the Mohawk River, Sanquoit and West Canada creeks with brook trout, and will also stock streams about Boonville, Trenton, and Black River. At its election, a few days ago, the following officers were elected:—President, Chas. W. Hutchinson; Vice Presidents, I. C. McIntosh, Horatio Seymour, Jr.; Secretary, Chas. R. Weed; Treasurer, T. R. Proctor; Prosecuting Attorney, Thos. E. Kinney; Delegates to the State Convention at Geneseo—E. B. Graham, Chas. W. Northrup, Chas. R. Weed, Chas. W. Shapley, J. J. Flanagan.

NEW HAMPSHIRE.—A sportsman's club has been organized at Laconia, N. H., to be known as the Laconia Sportsman's Club. The club now numbers fifty members, with the following officers:—President, Frank R. Gammon; Vice Presidents, John Crane and Samuel A. Clark; Secretary, James Ellis; Treasurer, Lloyd Lindsay. The club, financially speaking, is in good condition, and is going to have a club room fitted up with a shooting gallery.

CONNECTICUT.—A sportsman's club has been formed at Natick, with the following officers:—President, W. P. Bigelow; Secretary and Treasurer, E. H. Wilson; also, a board of five directors. In addition to the preservation of game, and the enforcement of the laws thereunto pertaining, the club has for its object the stocking of the waters in the vicinity of Natick with fish, and one of their first moves will be to place a supply of inland salmon in Dry Pond this season.

—The Massachusetts Angler's Association, under the leadership of its President, Dr. John P. Ordway, is doing a great work. They have just succeeded in getting a law passed by their Legislature that will prove of incalculable benefit to Maine, New Hampshire, Vermont, Connecticut, and New York. It makes the having trout, land locked salmon, etc., in possession between October 1st and April 1st *prima facie* evidence of having killed the same, and subjects the possessor to a fine for each fish.

GREENVILLE FISH AND GAME CLUB.—We acknowledge receipt of a copy of the amended Game Laws of Pennsylvania from M. Hargen Brooks, Secretary of the Greenville Club, as above, accompanied by the following letter:

May 20th, 1876.

EDITOR FOREST AND STREAM:—

By the inclosed you will see what progress our club is making. We have a hooded cards (paste board) same as the inclosed, printed and framed, and will have them distributed through this and adjoining counties, so that the inhabitants shall not be ignorant of the law. We have thirty members already, and many join at every meeting.

MEETING OF THE MICHIGAN STATE SPORTSMEN'S ASSOCIATION FOR THE PROTECTION OF GAME AND FISH.—The first annual meeting of the State Sportsmen's Association was held at the Council room in Jackson, Tuesday afternoon, 9th May, 1876. Dr. Holmes, of Grand Rapids, 1st Vice President, called the meeting to order. He called the attention of the association to the fact that the main idea of this association was the protection of food-producing animals and insect-destroying birds; not for mere selfish ends, but as a public benefit. He hinted that the most important thing to be legislated for was the proper way of taking game. If birds were allowed to be netted even in an open time they would soon be exterminated. Next, the time of taking and the time of exporting should be looked after. He favored the appointment of a State Commissioner for the protection of game, who should have charge of the matter of preservation of game and punishment of offenders.

W. C. Colburn of Detroit, was elected Secretary *pro tem*, D. H. Fitzhugh of Bay City, was elected Treasurer *pro tem*, and J. E. Long of Detroit, and H. E. Southworth of Jackson, were appointed Committee on Credentials. Delegates were present from the Detroit and Lake St. Clair Fishing and Sporting Club, Kent County Sportsmen's Club, Forest and Stream Club of Jackson, Detroit Gun Club, Battle Creek Sportsmen's Club, and Allegan County Sportsmen's Club.

A. J. Kellogg offered a resolution fixing an honorary membership, to be open to gentlemen eminent for scientific attainments, or who take an interest in the protection of game of the various kinds.

A letter was read from E. T. Slayton of Lapeer, which called attention to the insufficient protection to deer. The season now runs from September 15th to December 15th. He regarded the best time to close the season as November 15th, which would put a stop to the slaughtering of deer for market, the weather being more apt to be too mild for shipment. He also stated that residents of Oscoda county are in the habit of spearing and netting grayling.

James Headley of Dowagiac, called attention to the cruel practice of netting pigeons in Oceana county, and requested the association to take some steps to lay the matter before the Legislature for the purpose of procuring the passage of a law to prohibit this wholesale slaughter. The three communications were referred to the Committe on Game Laws.

Mr. Hubbard of Battle Creek, asked for reports by members of clubs as to the steps taken by their organizations to enforce the laws. These reports were in the main encouraging.

Mr. Kellogg said the Fish Commission had the past year planted nine millions of whitefish. The fish that in future will receive most attention are the lake trout and black bass, and some parts of the State asked grayling and even eels. The Oswego bass and Skaneateles lake trout will be introduced, if possible, to obtain the spawn.

The election of officers was then proceeded with. The following were elected:—

President—E. S. Holmes, Grand Rapids; 1st Vice President. Grove H. Wolcott, Jackson; 2d Vice President, E. O. Nichols, Battle Creek; Secretary, Arthur J. Holt, Grand Rapids; Treasurer, John E. Long, Detroit. The nominating committee reported the following delegates to the Chicago Convention; D. H. Fitzhugh, Bay City; W. C. Colburn, Detroit; E. S. Holmes, Grand Rapids; E. O. Nichols, Battle Creek; G. H. Wolcott, Jackson. Mr. Fitzhugh declining, R. P. Toms of Detroit, was substituted. Grand Rapids and the second Tuesday in May, 1877, were selected as the place and time for holding the next annual meeting.

—The Chinamen in California, who have been most destructive poachers, are now receiving the attention of the law. A San Francisco paper of late date says:—

"Twelve policemen hauled in a net yesterday afternoon at Hunter's Point. It netted twenty-one Chinese fishermen, who were sucked in under recent protective piscatorial legislation. They will be placed on the scales in the Police Judge's Court to-day."

—There are no less than six excellent and influential Game Protective Clubs, located in as many different States, that were named in compliment to this journal, and there may be others that we are ignorant of. These are the FOREST AND STREAM Clubs of Maine, Pennsylvania, (Philadelphia,) Tennessee, Michigan, Minnesota, and Florida—rather a wide-spread representation, and indicative of the range and influence of this paper.

—A correspondent now in Paris sends the following letter:—

5 RUE DE TILSETT, PARIS, April, 1876.

EDITOR FOREST AND STREAM:—

It is very gratifying to see the happy results of your most praiseworthy efforts for the preservation of our game birds, which I need hardly say has my warmest sympathy, as indeed, must naturally be the case with every right-minded sportsman. As long ago as 1874, in an article upon "Our Game Birds," published in the Agricultural Report, by the U. S. Government, I called attention to the great slaughter of our birds, more especially to the prairie chicken, and predicted that their speedy extinction, unless something was done to protect them. That the prophecy was not altogether vain, is proved by the disappearance of this valuable species, even within the last twelve years, in localities where they were then abundant. I trust the laws passed for protecting our game may be rigidly enforced, so that above all others, the snarer may find his trade too perilous to make it worth his while to continue it. A few lines of snare over a district do many times more harm than all the guns that could be shot in the same limits. D. G. ELLIOT.

POLO ON THE PLAINS—SHINNY ON A HORSE.

THE game of Polo has this year been introduced into America. Whether anything our journal ever said has influenced this consummation, we know not. Quite probably, no. The honor belongs in great part to James Gordon Bennett, a gentleman who has done more than any other to encourage, introduce, and promote new and improved athletic and field sports in the United States. Had we the same wealth, possibly we should ourselves wear the laurels. *Quien sabe?* Nevertheless, we believe that we made the first effort to introduce it here, whether rewarded or not; and by so much we claim some measure of consideration. In the very first issue of our paper, in 1873, we described the game of Polo, as it was played at Lillie Bridge, in England, remarking that it seemed to have become at last fully inaugurated in that country, after much effort—the game being, as we stated in a subsequent issue, (Vol. 1, page 39,) of East Indian origin, the irregular cavalry having played it at Hindostan for the twenty-five years previous.

Polo, as most of our readers know by this time, is simply hockey or shinny on horse-back. *St. James Magazine* says:

"The ball is much larger and heavier than at hockey, whilst the players carry cross-headed mallets with long handles instead of blackthorns. For the rest of it the two games are exactly alike, with well-defined goals at either end of the selected ground, through which Polo-players endeavor to force the ball by the united power of men and ponies.

"At the beginning of each game the sides remain at their respective goals until the umpire, proceeding to the middle of the ground throws up the ball as a signal to commence. Then, with mallets upraised and bodies bent forward, the rival squadrons make at each other as if on deadliest thoughts intent, until the player mounted on the smartest pony reaches the ball, and with a quick swing of his mallet sends it humming toward the opposite goal. From that moment the two sides are intermingled as they scurry hither and thither after the missile, which at one moment is nearly driven through this goal, at another through that, and so on, with alternate advantage to the sides, until a lucky stroke gains the victory, and the mimic warriors dismount to give their ponies and themselves a few minutes' rest.

Such is Polo to the casual observer; a fine manly sport, needing good horsemanship and good wind. To the adept it presents far higher characteristics, such as require the player to possess coolness, nerve, presence of mind, good humor, and proved stamina. For instance, the ball having been driven from one end of the ground to the other, between it and the goal but a certain debonnaire giant of the Hussars, who, being too heavy for much forward play, lies back. Merrily bounds the ball towards the doomed goal, whilst a few yards behind it rides, as for his life, a Spanish-looking player who hopes to have one more chance at it before great John drives it back. Vain the hope! Setting his pony into a canter, and judging the distance to a nicety, the big hussar brings down his mallet with unerring aim, just as the Don's is descending, and away flies the ball towards the farther end of the field, whilst Goliath again takes up his sentry-like position. How the great mallets whirl overhead, how the players' supple bodies sway low, first to this side, then to that, how nimbly the ponies twist and turn, striking the ball with their forefeet as if understanding all about the game, and what nasty whacks fall on arm and leg, hand and foot, as the "bully" goes on. Then more charges; then the chances of victory swing first to one side, next to the other; then, as the ponies begin to grow weary, you see their riders skirmishing about on chance of the ball coming their way, instead of following it like sleuth hounds; and then up charges the mighty hussar with his pony still fresh, and the game seems to be over as he gets the ball and strikes it fair for the goal. Not so, however; there's many a slip twixt the cup and the lip. One of the other side on a black pony rides up just in time, and the goal is saved. But see, like an arrow from a bow, shoots out the piebald from the crowd, and just as the ball is within a couple of feet of the posts, the Saxon rider cuts

across the Don's way, and his mallet swiftly descending, drives the missile to one side. Then a collision; then down go piebald and plucky lord in the dust, whilst the rest of players, riding up, prepare to renew the game. In an instant half a dozen are off their horses, whilst great John supports the lad in his ponderous arms, and saying it is only a bit of a stun, tells some one to bring the big watering pot. Which being done, and the young fellow's curly head duly watered, he comes to himself, looks around somewhat vacantly, rubs his pate which was struck by the piebald's forefeet when they rolled over together, and then calmly asks, "Did I save the goal, old fellow?"

Such is Polo; no more no less. In some such way it is played by our club at Jerome Park, which contains some English players, who, we presume, are adepts at the game. There is in it an element of danger, as, indeed, there is in all the hardier athletic sports, and both horses and riders frequently appear bandaged and swathed after a rencontre; but as a school for the cultivation and development of manhood in all its attributes, nothing can equal it because it requires good temper, presence of mind, perfect horsemanship, coolness of judgment, quickness of sight, suppleness of muscle, and unflinching nerve. A man must have these qualities to be a good player, and, since the game fosters, if it cannot create them, we may safely award it a word of praise without being open to the charge of admiring only what is novel.

When we wrote the caption of this article, we intended to confine our remarks to the single object of encouraging the adoption of Polo by our Cavalry, especially at frontier posts, where the services of cavalry are so constantly called into requisition against well mounted Indians, who are born riders. The thought is not new to us, for, by turning to our files, we find on page 106, vol. ii, (March, 1874), an article on Polo, which contains the following paragraph:—

"Will Polo ever be transplanted? Can it be found only in Thibet, India, or England? Have we no riders in the United States? Will no one pick up the gauntlet? Are there no broad expanses out West—grounds near military posts—where our own cavalry officers, fair rough riders, might try it?"

Even now Custer's command is roughing it among the Black Hills, where whacks harder than those of mallets will be given and received, and where Polo practice would prove its value in the effort to cope with crafty red men and their doughty Indian ponies. Why will not our cavalry regiments organize Polo clubs at once, even though the memberships number no more than a baker's dozen? We have readers and contributors at nearly every frontier army post in the country—scores of them in all—who will read our injunction. Let them act upon it, and a year hence, when they shall have gained profit by Polo practice, thank us for the suggestion uttered two years ago, and now reiterated. What says Capt. Chas. Bendire, of the 1st?

THE PRESS AT THE CONVENTION.—Not the least pleasant portion of our entertainment at Geneseo was the meeting of so many genial brethren of the press, many of whom represented their clubs as delegates, as well as their papers. From New York city there were Mr. Hamilton Busbey, of *Turf, Field and Farm*, and Mr. T. C. Banks, of *Rod and Gun*. Among the others present were, Mr. C. S. Benjamin, of the Rochester *Express*; Dr. N. Rowe, Chicago *Field;* E. L. Adams, Rochester *Democrat;* H. C. Daniels, Rochester *Sunday Times;* G. A. Edwards, Syracuse *Standard;* J. Flanagan, Utica *Herald;* Jas. Manning, Syracuse *Courier;* W. Hacker, Buffalo *Courier;* N. Todd, Batavia *Times;* A. T. Norton, Lima *Recorder*, and others. Mr. J. W. Clement, of Geneseo, issued a daily paper, known as the *Sportsman*, during the week, containing a full report each morning of the previous day's proceedings, a bit of enterprise which must have proved remunerative as it was in every body's hands.

THE INTERNATIONAL RIFLE MATCHES.—That our riflemen have not lost their skill was well evidenced by the wonderful shooting made in the match for the Leech cup at Creedmoor on Saturday last. Being shot at the long ranges and under the same conditions as the International matches and also the matches for the Elcho Shield, the great event at Wimbledon, it affords an opportunity of comparing with those events. Taking the first eight in Saturday's match, their united scores show a total of 1555 points; the winning score of the Irish team at Wimbledon was 1506 points, a difference in our favor of 49 points. In 1874 the Scotch team won with 1437 points, these being the best match scores ever made in England. It is probably no exaggeration to say that the first eight men who shot in the Leech cup match on Saturday, with Col. Bodine substituted for one of the younger men, would be invincible as a rifle team.

TO PATRONS IN ARREARS.—In view of the change in the business management of this paper, we beg those who are in arrears for subscriptions and advertisements to pay up at once, so that we may square accounts to June 1st, and wipe off the old slate. We are disposed to be lenient on account of hard times, but some thousands of dollars are due us, and our friends ought to know that no *stream* can run without feeders, or *forest* thrive in time of drought.

☞ Hereafter we shall stop our paper two weeks after the term of subscription expires, without farther notification.

—College journalism is becoming quite a feature in literature. Not content with a weekly paper, Princeton now issues a bi-weekly. Harvard prints an *illustrated* fortnightly journal.

—When Adam and Eve partook of the tree of knowledge, did they study the higher branches?

OUR CENTENNIAL LETTERS—LETTER NO. 1.

INDIAN IMPLEMENTS AND RELICS OF THE STONE AGE IN AMERICA.

THE importance of having a good exhibition of the antiquities of North America at this International Exposition was fully recognized by those in charge of the scientific portions of the display, and the attention of archæologists was early called to this feature, which invitation has been generously responded to. The Smithsonian Institution had the matter in charge, and solicited from their correspondents whatever specimens they could furnish in the way of objects of stone, bone, earthenware, etc., to include everything possible, tending to illustrate the past and present history of the aboriginal races now or previously inhabiting this continent, thus including what was strictly prehistoric in its character or relating to a long-past age, and what belongs to the present day.

We shall devote our space in this letter to the prehistoric relics, or those that pertain to an age of which we have no written or even traditional account in this country, reserving for a future letter the very full and interesting exhibition of the Indian tribes of the country as they have appeared during the last century. Of these antiquities there are two displays—that made by the Smithsonian, and those made by States, particularly Ohio.

The Smithsonian collections are in Agricultural Hall, and are exposed in a score of glass cases, all under the care and arrangement of Dr. Charles Rau. There are shown various forms of stone axes and celts—a "celt" being an axe which is not grooved about the middle; stone knives, and instruments for removing the flesh from hides preparatory to tanning; stone hammers of careful workmanship and shapely form, and others which are simply convenient pebbles, but which show by their battered ends the use to which they have been put; scrapers, smoothers, and polishers used in preparation of skins, and the bone awls and needles with which the aborigines sewed; the mortars and differently shaped pestles with which they ground their corn; spindles, pipes, tubes, vessels of earthenware and soapstone; masks that were laid over the faces of the dead; sinkers for their fishing nets; large flints for spear heads; an abundance of slender, leaf-shaped, and barbed arrowheads of flint, jasper, quartz, and chalcedony, and some interesting casts of noted Mexican carvings, especially the supposed "Calendar Stone."

This makes a fine collection, but, considering its size and the amount of the resources whence it was drawn, it lacks anything that is remarkable, or that the American antiquary is not already familiar with. For the purposes of general illustration to one who was not somewhat familiar with the subject, it is perhaps the best; but its rivals from the Western States in the Mineral Annexed to the Main Building, are objects of more interest to the archæologist, which will be of greater value to scientific visitors from abroad who wish to study the characteristics of our antiquities.

A very serious charge is brought against the Government collection, and against Dr. Rau, who had the whole control of its selection, to the effect that undue partiality had been given to the property of gentlemen at Washington, and to those relics which would illustrate the peculiar views of Dr. Rau, to the exclusion of what might militate against them. The circular above alluded to, inviting the contribution from all parts of the country of objects to illustrate ancient America, promised that these objects would all be exhibited, with due credit to the contributors, and afterwards go to form a part of the permanent collection at the Smithsonian. Relying upon this many persons have come to the Centennial expecting to see their gifts properly labeled in the cases, and are surprised at not being able to find them. The managers of this part of the exhibition are placed in an extremely unpleasant light by these alleged facts, and it is to be hoped that they can satisfy scientific men that they had good reasons for suppressing any private exhibits.

The Ohio collections are contained in fourteen table cases in the Mineral Annex. The contributors to it are H. H. Hill, Thomas Cleneay, and F. Gianque, of Cincinnati; the Rev. S. D. Peet, of Ashtabula; Prof. M. C. Read, of Hudson; Peter Neff, of Gambier; T. W. Kinney, of Portsmouth; J. P. Henderson, of Newville, and J. S. B. Matson, of Shelby. The exhibits are characterized by artistic appearance, and the presence of unique objects, only casts of some of which are to be found in the Smithsonian's cases. The faults of the collection are a lack of rude implements, and of those in process of construction; and too little discrimination between the remains of the Mound-builders and those of the red men.

The first object which attracts attention here is an immense axe of greenstone, 16¼ inches long. Near it are many other smaller axes of fine workmanship. The arrowheads and spear-points shown, which are chiefly of chalcedony, are the finest lot I ever saw. They are of all the recognized shapes, and some are so twisted or "rifled" as to spin when projected through the air. A few are made from obsidian, which must have been brought from Mexico into the Ohio Valley. Articles of mica are there also, which must have been imported from the tops of the Alleghanies, or North Carolina, at least; and others of copper from Lake Superior. It is well-known that the aborigines carried on an extensive system of barter, reaching from Mexico to Lake Superior, the evidences of which are everywhere abundant. The ornaments of the Mound-builders are well represented and include a variety of forms all cut out of a blue Silurian slate-rock which was easily worked and grew harder by exposure to the air. Many of these ornaments are in the form of sitting birds. The way in which they were worn was long a puzzle to students, but they are now thought to have been worn upon the head by married women as emblems of maternity. Dr. Henry Gilman obtained the first hint of this in conversation with an old Indian of a northwestern tribe, who said they were intended to typify the brooding mother-bird. A beautiful idea! Since then Dr. C. C. Abbott has found them at the head in very ancient graves in New Jersey, which, from the circumstance that they contained no warlike implements, were supposed to be graves of women. All of these implements, as well as the pipes, are highly polished. Pipes of both the modern Indians and the mound-building inhabitants are shown, the latter always carved in the semblance of some animal, as of a buffalo, elk, or turtle. One case is devoted to an interesting lot of awls, needles, and arrow-points of bone, and bears' teeth, upon which rude carvings had been executed. No doubt these teeth were trophies of the chase. There are also tally stones about the size of a folded two-foot rule, with a system of notches by which their owners kept account of games, and business transactions; curiously crescent shaped and highly polished stones, which may have been fastened upon wooden handles and carried by the chiefs as sceptres; and ornamental carvings upon flat stones which probably served as amulets, charms, or breast-plates. Some of these last contained a medallion-like carving of the human face, which, like the few masks shown, are well done, but do not compare in artistic merit with a small carving of a face found at Marysville, Ohio, now in the possession of Dr. Abbott. A very interesting relic is the original "Cincinnati tablet," of supposed magical significance, but the genuineness of which has been doubted. The skulls alone remain to be noticed. There are several of these in good condition and disposed in advantageous positions. They are good types of the Mound-builder's cranium, and all exhibit the fore-and-aft shortness, and great parietal width characteristic of the skulls of that race. The jaws are protruding and the top of the head is flat. In general, they are slightly smaller than the skulls of the red-skins.

Such are the general features of this fine display, and foreign students need not lack for material with which to compare the antiquities of the New, with those of the Old World. Ohio is supplemented by similar, although smaller, collections from Wisconsin, Indiana, Iowa, that of Wisconsin being especially fine in copper implements. All are illustrated by numerous photographs and maps of those enormous structures which that strange and ancient race erected all through the Ohio Valley and northward. The mind is lost in astonishment and admiration at the vastness and complication of these earth-works, and wonders that a people able to produce so much, should not have been able to leave more intelligible and definite races of their origin and career.

In my next letter I hope to illustrate the remains of those semi-civilized tribes, ancestors of the Moquis Indians, which were discovered and studied by Dr. Hayden's exploring expeditions of 1874 and 1875, a large series of photographs and models of whose cliff architecture and home-life are exhibited by the U. S. Geological Survey.

ERNEST INGERSOLL.

The Rifle.

CREEDMOOR.

SPRING MEETING OF THE NATIONAL RIFLE ASSOCIATION.—The spring meeting of the N. R. A. was held at Creedmoor last week, commencing on Thursday, and continuing during the two following days. The weather throughout was fine, but the attendance very small. The meeting opened with the match for the Director's badge, 5 shots off-hand, at 200 yards. Major Henry Fulton and Major D. D. Wylie tied on 21 points, and in shooting off each made centres until the third round, when Major Fulton made a bull's-eye to his opponent's centre, and won. Major Fulton also won the succeeding event, the open short range match also at 200 yards, off-hand, 7 shots, with a score of 31 points, those nearest to him being T. Schilling, J. L. Allen, and W. B. Farwell, with 30 points each. The last event was the "Individual" match, contested on the following conditions: Military rifles at 500 yards' distance; special military rifles, 600 yards, and sporting rifles 700 yards' distance, 5 shots each. There were 79 entries in this contest and two prizes. Following are the winning scores:—

Name.	Yards.	Total.	Name.	Yards.	Total.
W. Reed	500	24	R. Rathbone	700	22
A. H. Jocelyn	700	24	George Cronch	700	22
G. L. Morse	700	23	Charles Helsman	500	22
F. Hyde	700	23	W. C. Reddy	500	21
A. V. Canfield, Jr.	700	23	T. R. Murphy	500	21

The proceedings on Friday opened with the National Riflemen's Convention, which was held in the President's tent, Judge Gildersleeve presiding. The clubs represented were the Amateur Rifle Club of this city; Jamaica Rod and Rifle Association of Queens, L. I.; Hudson River Rifle Club, Poughkeepsie; Yonkers Rifle Association; Parthian Rifle Club of Hudson, N. Y., Connecticut Rifle Club of Stamford, Conn.; Scottish-American Rifle Club; Seventh Regiment Rifle Club, and Twenty-second Regiment Rifle Club of this city.

After Judge Gildersleeve had defined the objects of the meeting, which was to invite discussion among riflemen from all sections of the country as to the best means for the promotion of rifle practice, Sergeant D. Chauncey of the Seventh Regiment Club, offered the following resolution, which was adopted:—

Resolved, That the Directors of the National Rifle Association be requested to direct that in all military matches, open to teams representing military organizations, each team must use the rifles with which the organization it represents is armed.

Mr. G. L. Morse, of Yonkers, offered the following, which was also adopted:—

Resolved, That it is the sense of this Convention that "carton" targets for all ranges should be provided at the future meetings of the National Rifle Association.

On motion of Mr. Elmendorf it was resolved that "time" matches should be provided at 200 yards' distance at future prize meetings of the National Rifle Association in which magazine guns, which could be used as "single loaders," should be allowed. The following resolution was offered by Col. John Bodine, and adopted:—

Resolved, That the various clubs represented in this meeting, as well as other rifle clubs throughout the country, be requested to report, either through their delegates or by letter, at the meeting in September, their experience and opinions as to the best method of constructing and operating targets, with their estimated cost.

The first event contested was the military 200 yards match for teams of five, 7 shots each, with three prizes. The winning teams and scores were as follows:—

COMPANY H, EIGHTH REGIMENT.

Name.	Total.	Name.	Total.
Sergt. T. R. Murphy	26	Private F. W. Hofele	27
Private W. Bevans	29	Private W. Reed	25

Judge H. A. Gildersleeve	20		
Total			95

Saturday was a red-letter day in the annals of rifle shooting, some most remarkable scores being made. The great event of the day was the match for the Leech Cup, which, being shot for under conditions similar to those in form in the International matches, virtually decides the places in the teams for those events. Judge Gildersleeve's score of 204 out of a possible 225 has never been equalled across the water. There were 43 entries for this match, the conditions of which were 15 shots each at 800, 900, and 1,000 yards. The names and scores of those making 150 points and over are as follows:—

Names.	700 Yds.	800 Yds.	900 Yds.	Total
Colonel H. A. Gilsersleeve	68	71	65	204
E. R. Sanford	73	65	64	201
Henry Fulton	74	58	62	194
T. S. Dakin	70	64	59	193
W. B. Farwell	65	67	61	193
C. Overmeigh	63	64	67	194
R. C. Coleman	66	66	58	190
G. W. Yale	72	59	58	189
E. H. Raymond	64	63	61	188
M. Wasburn	63	62	61	186
A. Anderson	58	66	58	182
R. Rathbone	61	57	63	181
S. G. Perry	64	59	56	179
Colonel John Bodine	66	58	53	177
L. M. Ballard	70	61	45	176
C. A. Hodgman	67	65	44	176
A. D. Hodgman	69	55	51	175
G. E. Blydenburg	52	66	56	174
L. C. Bruce	55	53	55	173
A. V. Canfield, Jr	68	56	49	173
L. Webber	61	58	52	171
George Crouch	65	55	50	170
F. Hyde	69	60	39	170
W. S. Elmendorf	64	58	48	170
A. S. Swan	57	57	54	168
L. Geiger	69	44	54	167
H. Fisher	66	60	40	166
H. S. Jewell	63	53	49	165
C. Dusenbury, Jr	65	52	41	158
D. E. Davids	67	47	44	157
J. S. Conlin	57	53	41	151

This match affords a capital illustration of the increased skill of our riflemen. Last year the cup was won by Col. Bodine with a score of 205 points, but there were but 11 contestants who made 150 points and over, while this year there were 29. The last match was for the Patrick Henry rifle, 18 shots each at 1,000 yards, in which the following scores were made.—

Name.	Total.	Name.	Total.
H. A. Gildersleeve	46	A. V. Canfield, Jr	37
T. S. Dakin	45	L. M. Ballard	34
Henry Fulton	43	L. C. Bruce	28
G. W. Yale	38		

—Our report of the opening festival of the Schnetzen Park, Union Hill, N. J., and matches at Milwaukee are unavoidably left over until next week.

—The Geiger Bull's-eye trophy, for which Mr. W. B. Farwell and Gen. Dakin recently tied, has been awarded to Mr. Farwell, he having fired a deciding shot.

—The rifle match shot at Belleville, Ontario, May 27th, by teams from the Forty-ninth Rifles of Belleville and Forty-eighth Regiment National Guards of this city, was won by the latter by the score—Oswego, 372, Belleville, 352.

SEVENTH REGIMENT.—In our issue of May 25th, Rifle Department, it was stated that in the competition for trophies at Creedmoor on the 20th May, the "Shells" (prize) were won by Private Nichols of Eighth Company. This is an error. Private C. H. Eagle, of Second Company, was the fortunate man, with a score of 22 out of a possible 25 at 500 yards. We have been permitted to see this prize, and a very pretty jewel it is.

—A Washington (D. C.,) correspondent kindly sends us some account of deer shooting in West Virginia, which we have not space to print entire. The sketch, however, gives our readers the desirable information that by taking the Baltimore and Ohio Railroad to Doe Gully Tunnel, in Morgan county, one will reach the heart of the deer country, which is mountainous. A mile from the station is the hospitable house of the widow of Martin H——, who can accommodate five or six well-behaved gentlemen at the low price of $1 per day. Two grown-up sons serve as guides. Turkeys and squirrels are found here in considerable numbers, as well as deer.

MASSACHUSETTS—The Mt. Washington Rifle Club, Haverhill, Mass., had their regular shoot Saturday, May 27th. The usual Creedmoor target was used. The following is the score; distance, 200 yards off-hand, 10 shots. A very high wind was blowing:—

Name.	Total.	Name.	Total.
M. A. Hill	30	W. S. Willey	32
J. Mannus	28	G. F. Foss	26
H. Abbot	35	C. A. Kimball	21

CONNECTICUT.—The new range of the Connecticut Rifle Association "Willow Brook," at Berlin, has been formerly opened with a series of matches at 200, 500, 800, 900, and 1,000 yards. In the 200 yards match, 7 shots, the scores were as follows:—

Name	Total.	Name.	Total.
G. P. Babcock	28	A. Osman	25
G. W. Yale	27	J. B. Mix	24
J. E. Stetson	26		

At 500 yards there were about 20 entries. Following are the highest scores, that of Babcock being remarkably good, 35 being the highest possible:—

Name.	Total.	Name.	Total.
G. P. Babcock	34	A. Hubbard	29
J. L. Woodbury	32	A. Osman	24
G. W. Yale	30	J. C. Kinney	30
J. E. Stetson	28		

There were about ten entries for the match at the three long ranges. Following are the best scores:—

Name.	800 Yards.	900 Yards.	1000 Yards.
G. W. Yale	4 5 5 3 5...32	2 4 4 0 2...12	5 3 5 3 4...20
J. B. Stetson	5 5 4 5 3...32	4 4 4 4 3...19	2 2 0 0 3...7
J. B. Rowe	3 3 2 3 3...14	3 3 4 5...17	0 0 2 0 0...2

Grand totals—Yale, 54; Stetson, 48; Rowe, 33.

The range is now open to the members for practice, there being four Wimbledon targets in position. A series of military matches will be shot shortly.

—The annual practice shoot of Co. I, Second Regiment, N. G. S. C, took place at Meriden May 13th. The following are the scores of the company team, eight men, five shots each, 200 yards off-hand; highest possible, 25:—

Name.	Total.	Name.	Total.
Capt. Bgobee	20	John Lane	17
Chas. Sanford	20	George McClean	16
Lieut. Wood	18	John Harmon	15
John Murphy	19	T. S. Rost	15
Total			141

The Peabody rifle was used on this occasion, it being the State arm.

OWLS HEAD RIFLE ASSOCIATION.—This new rifle association has leased about twenty acres of land at Bay Ridge, Long Island, upon which they have created a range for practice at 200 and 500 yards, which will probably be opened during the present week, and will be extended to 700 yards. This new range possesses many attractions from its accessibility to New York, the Steamer Bay Ridge making the trip from foot of Wall street in thirty minutes. The officers of the club are: President, Dr. O. Meyers; Vice President, E. Kent, Jr; Secretary, F. W. Kent; Treasurer, G. H. Hope; Range Superintendent, Otto Heinigke.

—In a rifle shooting contest in England recently for the "Belgian Souvenir Cup," offered for the competition of English volunteers, private J. Lord made the astonishing score of eighty-two out of a possible eighty-four, seven shots each at 200, 500, and 600 yards. He made bull's-eye at every shot except two, which were centres. This is said to be the highest score ever made by a rifleman.

Game Bag and Gun.

THE STATE SHOOT.

THE grounds selected for the pigeon matches at Geneseo, last week, were admirably adapted for the purpose. Just across the Genesee River lies a beautiful meadow, comprising some 500 acres of land. A fringe of trees bordered its edges, and within the soft turf had just reached to ankle depth. Nearly all of the clubs sending delegations had tents pitched upon the ground, which were kept hospitably open and supplied during the week. A rough building had been erected as an office for the Secretary and Treasurer, within which a raised platform gave the score keepers and press representatives an excellent opportunity of seeing the shooting. To one who had never before attended a "State shoot," there was much that was novel and of interest in the proceedings. With two matches to be shot in a day, and over a hundred entries in each, and four prizes for as many different classes, system and rapidity were absolutely essential. In front of the stand six H and T plunge traps were fixed in the ground. The contestants were numbered off in squads of twelve each, six being at the score while the other six stood ready to take their places. As a bird is killed or missed, the scorer announces the result and calls the next man to the score. With a good "caller," the shooting is carried on almost with the rapidity of rifle-firing. At every round six boys, each with a pigeon in his hands, dart from the shed where the pigeons are kept and fill the traps. One squad having shot at their quota of birds while the next are preparing, the boys swarm over the field and gather in the dead birds, wringing the necks of the wounded. There were ten thousand pigeons on the ground, brought from Michigan by Mr. Knapp for the purpose. The birds were extremely lively, and in good condition. There were probably, at the least, one hundred and fifty persons shooting during the week, and of course guns of every make and fashion were in use. The manner in which breech loaders have superseded muzzle loaders was manifest from the fact that not more than half a dozen of the latter were in use. Some of the best shots, however, stuck to the old piece, notably Mr. George Smith, of Buffalo. In breech loaders every description of gun was represented, from the Scott "premier" to the cheapest native. We even noticed one Lafauchaux, the father of all breech loading shot guns. Most of the shooters used No. 9 shot, which seemed too fine to us until we discovered that many of the crack shots were shooting guns more or less choke bored, the object being to get as many shot as possible into the bird, so as to prevent his getting beyond the 80 yards boundary. In shooting off ties at the longer distances, say 31 yards, No. 8 shot was used. In the style of shooting there was as much difference as in the guns shot with, some men seeming to shoot in a slip-shod manner, half their birds being scored just within bounds, and the other half either escaping altogether or dying outside, while others seemed to hold so true on their birds, and to have their charges so properly adjusted, that their birds were killed clean. Of the first event, the State trap shoot, we gave a summary in our last issue. The other events were as follows:—

Single trap shoot for amateurs, ten single birds each; four prizes for first, second, third, and fourth classes of shots. To be competed for by those who never won a prize at a State shoot. To be governed by the rules of the New York State Association. Entrance fee, $5. First prize—one of Nichols & Lefever's extra double barrel breech loading shot guns, valued at $250, to be made to the order of the winner; donated by Messrs. Nichols and Lefever, Syracuse, N. Y. Second prize—a gold hunting case watch, valued at $125. Third prize—$30 cash. Fourth prize—a waterproof hunting coat and vest, valued at $15; manufactured and donated by W. H. Holabird, Valparaiso, Ind.

In this match there were about 120 entries, with the following scores:—

Names.	Total.	Names.	Total.	Name.	Total.
Caster	5	Parker	8	Green Smith	6
Williams	7	Rudman	7	Dunlum	7
Lamberton	5	Betts	5	D. M. Lefever	9

Grobe	7	Laverick	3	Forsyth	10
Faulkner, H. J	7				

Five having tied on ten birds, they went back to 26 yards to shoot off, with the following result:—

TIES ON 10 BIRDS, 26 YARDS.

Name.	Score.	Total.	Name.	Score.	Total.
Weigel	1 0 0 0	1	Sidway	1 0 0	1
Burgess	1 0 1 1 6	3	Forsyth	1 1 1 1 0	4
Van Vleck	1 1 1 1 0	4			

AT 31 YARDS.

Van Vleck	1 1 1 1—4	Forsyth	1 0 1 0 2

The first prize being won by Mr. Van Vleck, of the Forrester Club of Buffalo. The other ties were not shot off until Wednesday morning. Our space will not permit us to recapitulate the result in full; we can only say that in shooting off the ties of 9, Mr. Ridley of Seneca Falls, being the only one to kill five straight birds, won second prize. After two ties at 31 yards, John Cook, Jr., of Buffalo, won third prize, and the fourth fell to W. E. Richmond, of Buffalo.

WEDNESDAY—Single trap shoot, 9 o'clock A. M.—Ten single birds each; open to members of all organized clubs of this State. Four prizes, for first, second, third and fourth classes of shots. To be governed by the rules of the New York State Association. Entrance fee, $5, first prize, $100 cash; second prize, a silver tea set, with coffee urn, valued at $90; third prize, a full corduroy hunting suit, to be made to order from the measure of winner, valued at $45, donated by George Goode, English tailor, Geneseo, N. Y.; fourth prize, a case of 24 one-pound cans lightning powder, valued at $36, donated by the Laflin & Rand Powder Company, Buffalo, N. Y.

As the number and names of entries in this match were almost identical with those in the foregoing, we cannot spare space to repeat the scores in detail. But four tied on 10 birds, and shot off at 26 yards with the following result:—

Name.	Total.	Name.	Total.
Forsyth	3	Latin	3
Evershed	3	Murray	3

The first prize went to M. L. Forsyth of Geneseo.

Nineteen tied on 9 birds, six of whom again tied on 4, the last tie being shot off at 31 yards, with this result:—

Name.	Total.	Name.	Total.
Ten Eyck	4	Hudson	3
Soule	2	Van Ostrand	1
Manning	5	Chamberlain	1

The second prize was thus won by J. M. Manning of Syracuse.

Twenty-one tied on 8 birds, and in shooting off the third prize went to Mr. George Van Vleck of Buffalo. Mr. Halloway of Syracuse won fourth prize.

Double Bird Shoot—ten double rises each.—Four prizes, for first, second, third and fourth classes of shots. Open only to members of organized clubs in the States. To be governed by the rules of the New York State Association. Entrance fee, $5; first prize, $75 cash; second prize, $50 cash, third prize, a patent tilting ice-urn, valued at $35; fourth prize, a marble top, inlaid flower-stand, valued at $20.

This match was not concluded until Thursday afternoon. There were 61 entries, and considering the strong wind and unfavorable background, the shooting was very good.

Eighteen was the highest score made, and of these there were five. The first prize was won by Mr. Wakeman of Batavia. Of seventeens there were 5; second money being won by James Manning of Syracuse. Of sixteens there were four, and the third prize was won by Peter Tompkins of Batavia. Of fifteens there were 8, and the fourth prize was taken by Horace Silsby of Seneca Falls.

The next event, and possibly the most interesting to a number present, and certainly the most amusing to all, was the Press match at 5 birds each. Twelve Knights of the Quill stepped to the score, and the pigeons began to fly—in fact, "the woods were full of them." Mr. N. Hucker of the Buffalo *Courier*, whom we strongly suspect of having been there before, killed his five birds without a miss, and carried off the elegant arm chair which was offered for first prize. Dr. N. Rowe of the Chicago *Field* took second prize—a camp lounge, donated by *Rod and Gun*—and Mr. O. Woodruff of the Geneseo *Republican*, the gold pen for the poorest shot.

The next event was the

Single Trap Shoot—Fifteen single birds each.—Four prizes, for first,

second, third and fourth classes of shots. Open only to members of organized clubs from this State. To be governed by the rules of the New York State Association. Entrance fee, $5; first prize, one of Parker Brothers best double-barrel, breech loading shot guns, with entire outfit and case, valued at $300, manufactured and donated by Parker Brothers, West Meriden, Conn.; second prize, $100 cash; third prize, a hunting-case, stem-winding silver watch, valued at $60; fourth prize, a case of 24 one pound cans Falcon powder, valued at $30, donated by the Oriental Powder Company.

There were 96 entries for this match, of whom only two killed the entire 15—Messrs. Drake of the Foresters, of Buffalo, and A. Evershed, of Irondequoit. The first prize was won by A. Evershed, of the Genessee Club, of Irondequoit, who killed 5 straight at 26 yards. In the ties of 14 there were 7. The second prize—$100—was taken by Ed. Lodder of Syracuse. Of thirteens there were 13 ties, and the third prize was won by George W. Marsh, of the Forrester Club, of Buffalo. There were 18 ties of 12. The contest was close, but Mr. James Halloway, of the Central City Club of Syracuse, was too much for them at the 31 yard score, and carried off the fourth prize.

FRIDAY, May 26th.—Livingston Sportsmen's Association Cup, donated by James W. Wadsworth, Geneseo. Open to all organized clubs of the State, members of the State Association. To be held by the winning club each year in trust, to be accounted for to the New York State Association. To be shot for by two members resident of the county in which the club is located; at 15 double rises each, in accordance with the rules of the New York State Association. Entrance fee, $30. The entrance fees to belong to the club holding the cup.

The following is the score:—

—At the pigeon shoot of the Leather Stocking Club of Oswego, on May 19th, H. C. Tanner won the club revolver, killing 13 birds out of 15. There were 13 entries. For the gold medal there were also 13 entries, 10 birds; J. B. Poucher won it, with 9 birds out of 10, but it was immediately contested for by ten competitors, O. Schrieves proving victorious; Tanner second.

THE CHAMPIONSHIP.—The match between Captain Bogardus and Dr. Talbot for the championship is to be shot at Philadelphia on the 6th of June. 100 birds are to be shot at by each, 20 at 21 yards rise, H. & T. traps, 30 in pairs at 18 yards, and 50 from five traps; English rules.

PENNSYLVANIA.—The semi-annual shoot of the Sharon Shooting Club came off on the 11th and 12th ult. One thousand wild pigeons had been provided, and the large party of spectators present inclnded some first-class shots. The first match was for the club gold medal, held by Henry Crosthwaite. The following were the scores—10 birds each:—

Name.	Total.	Name.	Total.
Crosthwaite	7	Dickson	8
Tribby	7	Obl	5
Samuels	9	Pew	3
Urmson	6	Morgan	2
Griffith	7	Carter	8
Connelly	10		

Following this was a sweepstakes at 5 birds each, for which there was seventeen entries. Messrs. Lovet, Clesson, Tribby, and Connelly tied on 5 birds, and shot off at 26 yards, Messrs. Lovet and Clesson again tieing, but upon shooting off at 31 yards, Mr. Clesson won. The second prize fell to Mr. Patterson, the third to Carter, and the fourth to Ray. The next match was at three double rises, which was won by Crosthwaite, he killing all his birds. Six ties were shot off between Messrs. Trasdale and Ray for second money, the latter finally winning. The first match on the second day was a sweepstakes at 5 birds, Mr. C. Lovet winning first money, J. Lovet and Crosthwaite dividing second, Streeter took third, and Walters fourth. The most important match was that at 10 birds, $10 entrance, in which first money was won by C. Lorst, he being the only one who killed all his birds. Ray won second prize, Hopkins third, J. Lovet fourth. The last match was at double rises, and was won by Lippy, Walters taking second money, and Ray third.

—A pigeon match was shot at Richmond, Va., on the 24th, between C. H. Epps, the crack shot of the Richmond, Club, and W. T. Mitchell, with 1½ oz. shot, Mitchell to use one hand and Epps both. Although this was Mitchell's first trap shooting, he won by a score of 7 to 6.

COUNCIL BLUFFS, Iowa, May 22d, 1876.

EDITOR FOREST AND STREAM:—

The first of a series of matches organized within the Council Bluffs Sportsmen's Club, came off on Saturday, the 20th inst. The match was at ten single birds each, from five ground traps, 26 yards rise, 80 yards boundary, 1¼ oz. shot, powder unlimited, with the privilege of both barrels. The birds were wild, and nearly all of them strong and swift flyers. The day was pleasant and cool, with a very high wind from the southwest. The following shows the sides and scores:—

MORE CARE NEEDED!

EDITOR FOREST AND STREAM:—

Experientia docet! Yet how much to be regrtted is the fact that the multitude of persons learo so slowly the lessons taught by the experience of individuals. The constant use of fire-arms unfortunately too often fails to ensura the necessary caution that should he ever borne in mind, and few sportsmen realiza how carelessly they often handle their guns, especially when excited by the near presence of game, at which time little thought is given to one's surroundings. And yet every sportsman would indignantly deny an accusation of carelessness, and really believe himself incapable of doing the many careless acts that render possible a shocking accident; and even when his attention may be called to one such act, it makes but little impression on his mind, since he is usually unconcious of doing it, and in the absence of the occurrence of any accident the refrom, the incident is soon forgotten, and perhaps many times repeated ere he is again reminded of it. There is one rule for handling agun, that should be always adhered to, and be kept ever in mind. So use a gun as never to admit the possibility of an accident. I was given a gun at eleven years of age, with the injunction enforced upon my miad by my father, "never allow it to be aimed towards a human being." And this lesson I have so constantly borne in miad that it has become a habit. How often have I seen a sportsman with a loaded gun on his shoulder, or lying in the hollow of his arm, turn around, and in so doing, alternately cover all of his campanions with it. Nearly all of the shootiog accidents that are of too frequent occurrence, are owing to carelessness. Mr. Hipp, formerly of Cincinnati, was killed at Lexington, Ky., by placing his goo against a fence which he climbed over, and then drew the gun after him in such a way as to discharge it with fatal effect. Mr. James P. Robioon, of this city, was killed yesterday morning at his residence as he was about starting on a pleasure excursion. As he was gaiag to his buggy he slipped and fell with a loaded gun in his hands. The gun was discharged, and he was thus killed. Both these accidents were the result of carelessness, for no one should ever draw a gun towards him by the muzzle, and no one should start out to drive with loaded guns.

I would make the earnest suggestion, that a prominent place in the columns of all our periodicals devoted to field sports, be given to the record of such shooting accidents as may occur, with attendant circumstances, that the danger may be ever before the eyes of sportsmen. Some may exclaim, that true sportsmen are not guilty of such carelessness. But they are oft times so guilty, and the two gentlemen here named were sportsmen. I think that if the FOREST AND STREAM will follow my suggestion, it may be the meaas of some reform.

As I now lie in bed suffering from a gunshot wound, I am impelled to write these lines as a contribution towards this object. My own casualty occurred while duck shooting in this vicinity. I was on the shore of a lake, and Mr. C. approached me in a punt, when within four yards of me he saw some ducks approaching, and as he stooped to reach his gun with his head turned to watch the ducks, I saw that the gun was lying in the bottom of the boat with the muzzles towards me, and moved aside as quickly as the mud and water, in which I was standing, would allow me. My precaution saved my life, for I had taken but one step to the left, when the gun was discharged. The charge of duckshot passed so close to me that I received several pellets in my right leg below the thigh, and one pellet in my trigger-finger. Although the wound is slight, my escape from death was sufficiently narrow to convince me that the gun should never be allowed to remain at full cock when within close range of other persons. When shooting over dogs, it is highly dangerous to carry the gun at full cock, as many are in the habit of doing. A trip of the foot or other slight slip might be occasion the death of a friend; and when the gun is cocked in expectation of immediately flushing the game, let it be held perpendicularly, with the muzzles upward.

The physical pun that I now suffer will soon pass away and be forgotten, but should I ever shoot a friend, it would cause me such mental anguish as would last until death. ROAMER.

FLANNEL SHOT CARTRIDGES.

MILWAUKEE, May 12th, 1876.

EDITOR FOREST AND STREAM:—

While spending a few days at Pine Lake, twenty five miles from here, I remembered, in Vol. VI. No. 9 of your paper, from a "pnor shot," an article concerning and relating to flannel shot cartridges. I thought the idea excellent, and at once set about making experiments, as follows:—

I made some bags about two inches long, using instead of flannel a piece of cheviot cloth. These I filled with 1½ oz. No. 5, and loaded them into brass shell containing 3¼ drs. Hazard Ducking powder. The first one I used I killed a duck (blae-bill) at the least calculation seventy-five yards distant. The next I fired at another of the same species at least one hundred yards off, but the distance was either too great or my aim incorrect. My third and last trial was at a target (twenty-inch circle) at seventy-five yards, and it made a splendid pattern. I regret the loss as I intended sending it to you. I am convinced that they only need be tried to be appreciated. To be sure they are not as efficient or handsome as the "tin cased cartridges," but for a cheap long-range shot cartridge I think they are excellent. I should much like to have some others try the experiment and give us the benefit through the columns of the FOREST AND STREAM. WING SHOT.

MIXING POWDERS

SANDY HILL, May 13, 1876.

EDITOR FOREST AND STREAM:—

Having tried the various kinds of powder within my reach, among the different kinds Orange Lightning, Orange Ducking, and Orange Rifle, Hazard's Electric Ducking and Sea Shooting, or F. G. T., Hazard's Sea Shooting giving the most satisfactory results taking both the cost and performance into account, I concluded as an experiment to try Dittmar's, and accordingly procured a can of his F. F rifle powder, and found his claims verified, except perhaps that one needs to use a slightly larger charge, and to get the same penetration you have to stand about the same recoil as from black powder. Its cleanliness is simply marvelous, and it is entirely satisfactory in that respect. But its cost is a serious affair. And so while turning the matter over, it occurred to me that possibly one might get clean powder and at a price that common people could afford to use, by mixing the two kinds. Accordingly after a few preliminary shots, I mixed a quantity in the proportion of three parts by measure of black powder to two parts by measure of Dittmar's. And loaded therewith twenty cartridges; proceeded to fire ten of these and found the barrel as clean as after the first discharge, and as clean as though I had used Dittmar powder alone. I then fired two cartridges loaded with black powder alone. There was apparently a coating of residum covering and extending down the barrel six or eight inches from the muzzle. (The gun was a Parker 12-gauge choke-bored). I then returned in the cartridges loaded with mixed powder. On looking through the barrel after the first discharge found it clean, and after firing the twenty-two shots the gun was to all appearance as clean as after one discharge with Dittmar's powder alone.

The pattern throughout the trial was good and very uniform. The penetration equal to black powder. The compound cost me about fifty-three cents for the equivalent to one pound of black powder. Very likely some one or more of your readers may have been for themselves through this experiment. It will cost but little for any one to try it. It strikes me that this way to get a good clean powder at a low price is to mix a low price black powder with Dittmar's. A. B.

TEST OF KAY CONCENTRATORS.

PHILADELPHIA, May 12th, 1876.

EDITOR FOREST AND STREAM:—

Wishing to ascertain with certainty the effect of the Kay shot cartridge at long range I procured a pound and tried them. The gun used was a 12-bore 7¼ lbs., W. C. Scott & Son's fine breech-loader, not choked; the shells were Ely's brown paper, loaded with 3¼ drms. Dupont's Duck No. 2. powder, with two wads on top. The cartridges contained each 1 1-16 oz. of Tatem's shot, and were kept in place in the shells by creasing, without wads over them. The targets were of stout paper 30 inch circles, secured against a white pine stand 31 inches square and 7-16th of an inch thick. The distances were accurately measured and not stepped off, and the gun was fired from a firm tripod rest. The following are the results of the shooting, showing the number of pellets put within the circle at each distance:—

Distance.	Total.	Distance.	Total.
1—At 100 yards with No. 4 shot	5	1—At 80 yards with No. 4 shot	7
2—At 100 yards with No. 4 shot	9	2—At 80 yards with No. 4 shot	20
3—At 40 yards with No. 1 shot	36	3—At 80 yards with No. 4 shot	9
4—At 40 yards with No. 1 shot	16	4—At 80 yards with No. 4 shot	15

Distance.	Total.	Distance.	Total.
1—At 75 yards with No. 4 shot	16	1—At 65 yards with No. 6 shot	47
2—At 75 yards with No. 4 shot	22	2—At 65 yards with No. 6 shot	50
3—At 75 yards with No. 4 shot	10	3—At 65 yards with No. 6 shot	21
4—At 75 yards with No. 4 shot	13	4—At 65 yards with No. 6 shot	35

Distance.	Total.	Distance.	Total.
1—At 50 yards with No. 8 shot	15	3—At 50 yards with No 8 shot	58
2—At 50 yards with No. 8 shot	10	4—At 50 yards with No. 8 shot	19

The shot were carried with much force and pretty evenly distributed; those of No. 1 at 100 yards that struck the target, passed through the stand. The empty cases were found mostly within 20 yards from where the gun was fired; not a few of them were torn to tatters, while others were not torn at all—merely had their mouth spread open a little. There was no fault in loading the shells or in holding the gun when fired. I make no comments, wishing simply to give bold facts from which sportsmen may draw their own conclusions. OLD SPORTSMAN.

Rational Pastimes.

N. Y. ATHLETIC CLUB.—The open spring games of this club were held at their Mott Haven grounds on Tuesday. Following is a summary of the events:—

Walking Race—1 mile, 10 starters.—1st, Thomas McEwen, Scot Am. A. C., time 7m. 45s; 2d, H. H. Gates, Y. M. C. A., time, 7m. 49s.

Throwing the Hammer.—1st, James Melrose, Hartford, Cal. Club, 87ft.; 2d, J. McMillan, Scot Am. A. Club, 82ft. 4in.

One Hundred Yards Run.—1st, heat, A. J. McCosh, Princeton Col. Club; 2d heat, J. B. Elliott, Greenpoint; 3d heat, W. B. Curtis, N. Y. A. C.; 4th heat, W. J. Wakeman, Yale Club; final heat, 1st, A. J. McCosh, time 11s.; 2d, W. J. Wakeman, Yale A. Club.

Walking Race, 3 miles.—1st, D. M. Stern, N. Y. A. C., time 23m. 58s.; 2d, E. C. Holske, Lafayette B. B. C., time 24m. 4s.

One Mile Run.—1st, B. C. Williams, N. Y. A. C., time 5m. 2s.; 2d, Bennett Greig, Wood's Gymnasium, time 5m. 11s.

Putting 16-Pound Shot.—1st, James Melrose, Hartford Cal. C.; 2d, H. E. Burmeyer, N. Y. A. C.

Four Hundred and Forty Yards Run.—1st heat, H. G. Keeler, N. Y.; 2d heat, W. J. Duffy, Harlem A. C.; 3d heat, W. J. Wakeman, Yale A. C.; final heat, W. J. Duffy, time 59½s.

Half-Mile Run.—1st, E. C. Lamontagne, N. Y. A. C., time 2m. 23½s.; 2d, B. M. Hateh, Y. M. C. A., time 2m. 25s.

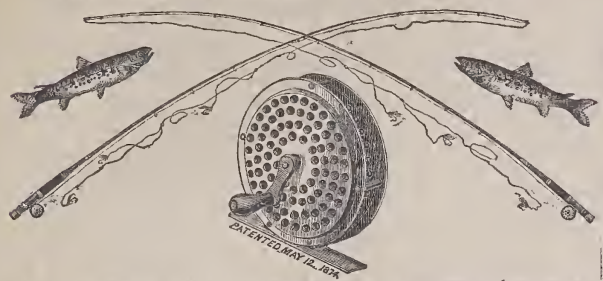
Running Broad Jump.—1st Geo. Hitchcock, N. Y., 15ft. 11½in.

One Hundred Yards Handicap.—1st E. C. Lamontagne, time, 11s.

Running High Jump.—1st H. E. Ficken, N. Y. Canoe Club, 5ft. 2in.

One Hundred and Twenty Yards Hurdle Race.—1st G. Hitchcock, N. Y., time, 20s.

The meeting was in every way a success, and the time made by Stern in the three-mile walking race surpasses any time ever made in a similar (amateur) event in this country. It was regretted that Mr. W. B. Curtis, of Chicago, was debarred by an accident to his hip from taking a more prominent part in many of the contests.



BASE BALL.

—A game was played at Westchester, Pa., on the 27th ult. between the Brandywine Club of that city and the Goodwills of Reading, resulting in a victory for the Westchester Club by 11 to 5. Both clubs are amateurs.

PHILADELPHIA—*May 29th.*—The Young America and the Philadelphia Cricket Clubs played a match at Germantown on Saturday, and the Young Americas suffered their first defeat for a long time. The Philadelphias went first to the bat, and made 92 runs. Hopkinson, Ashbridge, and Tiers making double figures. The Young Americas played with little care at first, and found their inning finished for 89 runs. Geo. Newhall, R. Newhall, E. Wright, and E. M. Davis did the bulk of the scoring. The bowling on both sides was good, and when the batting is considered the scores are low. It being a one day match, and not time left to complete the second innings the game was the Philadelphias. On Saturday next the Young America and Germantown will play. An interesting game may be looked for, as both clubs will present a strong team. SCULLS.

THE ORVIS REEL.

The Most Compact, Neatest, Cheapest, and Durable Reel in the Market.

NO 1.—This Reel is extra nickel-plated and finely finished. Is perforated to make it light, and keep it free from sand, also that the line may dry without removing it from the reel after use. Has a very perfect click. It is very light, very strong, and holds from 40 to 50 yards of line. It is more compact and less cumbersome than ordinary 20 yard reels. It is quite narrow, and takes up line rapidly. Put up in neat Block Walnut Case, price $5.

NO 2—For Prizes. Same style as No. 1. Heavy Gold Plate. Extra finish, with case, price $10.

Sent by mail, postage prepaid, on receipt of price, or by express, C. O. D. LIBERAL DISCOUNT TO THE TRADE. Send for Price List of Fishing Rods and Reels. Mention this paper.

THE NEW

BOSTON

SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murroy's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

SHOOTING AND FISHING SUITS, (complete).....$20

W. H. HOLABIRD

Would most respectfully announce to his patrons and friends that he is prepared to make

Shooting and Fishing Suits

at the above prices. The tea dollar suit is better made than any competitor can offer for the same money. My original design having been appropriated by other manufacturers, I have been compelled to make many changes in the arrangement of pockets, &c., for which I have to thank the fraternity at large for suggestions. I believe that I have the

BEST SHOOTING AND FISHING COATS IN THE WORLD,

and respectfully solicit your orders. I send my new illustrated Catalogue, 16 pages, free on application.

Dealers will find it to their advantage to handle my goods. They are better known and more highly esteemed than any other make.

HURST'S

Stereoscopic Studies

OF

Natural History

FOR OBJECT TEACHING IN SCHOOLS

And

PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will he added a second series of foreign specimens, and various animals and birds in grotesque attitudes, never, however, violating their natural instincts.

We offer these views, not as pictures only, but as studies from nature. One of the great moving elements in our modern system of education is object teaching. The unerring fidelity of the stereoscope transfers the animals and birds from their natural habitat to the rooms of the student and the fireside of our homes, where they cannot fail to have a lasting impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen, with its appropriate rocks, woods, or water, and coloring from the originals.

CORNELL UNIVERSITY, }
ITHACA, March 14th, 1870. }

I must congratulate you upon your great success in this new educational enterprise. If we can arrange our amusements so as to make them impart instruction to the mind, it will be a step in advance in education. EZRA CORNELL.

Prices: By the Dozen.....$3 00
By the Set of 5 Dozen, in Elegant Case, 16 00

SUBSCRIBE FOR THE

SCIENTIFIC FARMER.

A 16-Page Quarto, issued monthly, and full of original reading matter. It is devoted especially to science, as applied to agriculture, and is the only journal in the world published with this avowed object.

It records all true progress in agriculture, and the latest results of scientific research. Chemistry, botany, veterinary practice, natural history, farm mechanics, rural art and architecture, rural law and entomology, are all prominently considered in its columns.

AMONG ITS CONTRIBUTORS ARE:

President W. S. Clark, of the Massachusetts Agricultural College, who has few equals as a writer on scientific matters.

Prof. C. A. Goessmann, who is acknowledged to be the first agricultural chemist of America.

B. Lewis Stanton, author of the "Ayrshire Cow," the "National Ayrshire Herd Book," &c.

A. S. Packard, Jr., editor of the "American Naturalist," and State entomologist of Massachusetts.

Prof. N. Crosby, who is one of the foremost of our veterinarians, and is State Veterinary Surgeon of Connecticut.

Prof. Levi Stockbridge, whose experiments in cropraising, by special fertilizers, have created astonishing public interest.

Jos. N. Sturtevant, Esq., South Framingham.

Richard Goodman, Esq., Lenox.

Prof. J. Wilkinson, Baltimore.

Prof. H. W. Parker, Massachusetts Agricultural College.

Prof. S. T. Maynard, Massachusetts Agricultural College.

J. N. Bagg, Member of State Board of Agriculture.

Sportsmen's Routes.

THE "FISHING LINE."

Brook Trout and Crayling Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

The waters of the **Grand Traverse Region** and the **Michigan North Woods** are unsurpassed, if equalled, in the great abundance and variety of fish contained.

Brook Trout abound in the streams, and the famous **American Grayling** is found only in these waters

Brook Trout Season opens May 1st.
Grayling Season opens June 1st.
Black Bass, Pike, Pickerel, and Muscalonge are also found in large numbers in the many lakes and lakelets of this territory. The sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st **Round Trip Excursion Tickets** are sold to **Points in Grand Traverse Region,** and attractive train facilities offered to tourists and sportsmen; also on and after July 1st **Mackinaw and Lake Superior Excursion Tickets.**

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, Send to Forest and Stream office, or address

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Saguanee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kaneska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, *via* the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GREASE, AND QUAIL SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, W. H. STENNETT,
Gen'l. Supt., Chicago. Gen. Pass. Agt., Chicago.
ap6

TO SPORTSMEN:

THE PENNSYLVANIA R. R. COMP'Y

Respectfully invite attention to the

Superior Facilities

afforded by their lines for reaching most of the TROTTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

The lines of
The Pennsylvania Railroad Company
also reach the best localities for

GUNNING AND FISHING

In Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVA, BRADFORD, EMPORIUM, KALESTON, MINNEQUA, and other well-known centers for

Gibson's & Flint's Camp.

A LARGE, SUBSTANTIAL, LOG HOUSE, 25 miles north from Wilson's Mills, Maine. This place affords facilities for the sportsman second to none, being only two miles from the famed Pammechence Lake, the home of the largest brook trout in America, and at such distance from any settlement that all kinds of game are in abundance. A private front pond in connection with the camp. A good road has been cut through to the lake, and conveyance can be had at the camp. Fair prices only will be charged for guides and board. Two trout ponds have been discovered the past season that have never been fished before. This, in connection with the scenery around the lake and accommodations at the camp, make it a most desirable resort for the angler, hunter or tourist. Guides furnished and information given by T. P. Flint, Wentworth's Location, N. H. Route—Grand Trunk to Bethel, stage to Upton, and steamer to Wentworth's Location. Parties leaving Boston at 8 A. M. can reach the Location at noon of following day.
1t SPOFF FLINT, Manager.

FOR SALE—A FIRST CLASS FRUIT Farm in the thriving village of St. Joseph, Mich., containing ten acres set to Apple, Pear, Peach, and Cherry, 350 Grape Vines, and eighty rods of Lawton Blackberry, &c. All choice fruit. Good buildings adjoining the corporation. A rare opportunity for a market garden. Five daily steamers to Chicago and Milwaukee of fruit season; also daily fruit trains to Chicago via C. and M. L. S. Railway. Splendid Duck, English Snipe, Plover, Rail, and Woodcock shooting in season, and Bass and Pickerel fishing only one quarter mile distant. Healthy locality. Possession given next fall. For sale cheap, and terms easy. Address J. H. WAY,
je1 cowtf Corning, N. Y.

FOR SALE, OR TO LET.

The elegant country residence, WILLOW LAKE, at Locust Valley, near Glen Cove, Long Island.

Suitable for Summer Boarding-House.

The house is 24 stories, frame, 40 feet front and 32 feet deep, with wide piazza front, rear, and on south end. On first floor are parlors, sitting-room, and dining-room; wide hall through the centre. Up stairs are 9 bed-rooms, all large and airy; kitchen well-arranged and convenient; cellar large and dry.

On the premises, and at a convenient distance from the house, are a stable and carriage house, chicken-house, shed, coal, tool, and ice houses. The grounds are well laid out and tastefully planted with ornamental trees and shrubbery. The avenue leading from the road to the house skirts a beautiful lake, on the border of which the house stands. A Paper Mill at the north end of the lake will be sold with the above, subject to a lease. The lake and land embrace about 27 acres. As a place of residence it is elegant and healthy; for manufacturers it is convenient; for the preparation of fruit, for pleasure or profit, there is no better place in the State. Apply to
R. FRANCIS,
mch2 3m 47 Broad street, New York.

Board During Centennial

IN PHILADELPHIA.

A FEW SELECT TRANSIENT AND PERMAnent parties can be accommodated by a private family, strictly first class, with reasonable charges. Rooms can be engaged for the whole or any portion of Exhibition term. The house is situated within 12 minutes of the Centennial Grounds, and 20 minutes from the business centre of Philadelphia.

Buy tickets 832, 63, via Pennsylvania Railroad, for Germantown Junction Station, which is distant only 200 yards from the house. Address
L. GARVER, 2908 N. 16th St., Philadelphia.

BELMONT HOTEL,

623 and 625 Washington Street, Boston, Mass.,

(Opposite Globe Theatre.)

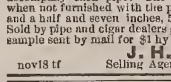
P. O. Box 329, Washington, D. C.

BUY IT Vanity Fair.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.

For Sportsmen.
A trusty friend, in weariness or trouble: a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.



From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.
A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.

Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2½ to 3¼ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 263 and 265 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,

may13-1y A. H. BOGARDUS.

CANADIAN ORNITHOLOGY.

"Our Birds of Prey."

BY

HENRY G. VENNOR, F. G. S.

THIS BEAUTIFUL AND NOVEL WORK CONtains 90 large Photographed Plates, and upwards of 150 pages of descriptive letter-press. It figures and describes every species of Eagle, Falcon, Hawk, Buzzard, and Owl that is known to occur or occasionally to have visited Canada.

No less than fifteen specifically distinct Falcons and Hawks, three Eagles, and ten Owls are described as inhabiting Canada, some of these, however, being given as "exceedingly rare."

The letter-press of the work is, throughout, based upon the Author's personal observations in the Canadian field between the years 1860 and 1876, and is filled with new and orginal facts relating to the distribution, habits, and nidification of these Birds. It also contains the observations of recent American writers on several species concerning which there has been much controversy.

The whole form a series which it would be difficult to improve upon, and one that is not to be found represented in any one collection in the Dominion of Canada—many of the Birds figured having been sent from distant places on purpose for these plates. All are Canadian Specimens.

The copyright of the whole work has been secured for Canada and the United States by the Author, and only a small edition will at present be issued. This will be distributed in Canada, to Subscribers in the order in which their names occur on the Subscription Lists. Early orders are solicited.

Price Complete, in Cloth (30 Plates), - - $12

P. S.—The Plates of this Work will not be sold separately, but if desired the whole book may be had in paper cover, $12.

TESTIMONIALS.

From Hon. J. T. Headley, the Historian, Author of "Adirondack, or Life in the Woods," &c.

It is admirably written, and has just enough of humor, sentiment, and description of scenery mixed, to make it delightful. The illustrations are well chosen and very effective, while the instructions respecting routes, localities, distances, outfits, &c., embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—a compliment that I trust will be properly appreciated for its extraordinary disinterestedness.

From Albert B. Street, the Poet and Author of "Woods and Waters," "The Indian Pass," &c.

I think it is the *best* work on the forest that has appeared—superior in word-painting to Murray's, and full of wood-pictures and vivid scenes of camp-life. We realize that we are in the forest, are living with you in the scenes described, and that the trees are waving and the waters flowing over and by us. This, I think, the true test of a good book, impressing its reality and distinctive life on the mind. As a "Guide Book," it is most creditable and valuable. Indeed, it is the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for. It must have cost you intense application and labor. You may well be content that you have produced a good book.

From Benson J. Lossing, the Historian.

I have read those portions descriptive of the places which came under my personal observation, with the deepest interest, and most cheerfully testify to the general accuracy of your pictures as I recall impressions made of them at the dates of my visits. I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wooderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.

Sent by mail on receipt of price, $2.

CHAMPION GUNS OF ENGLAND.

PAPE'S

Unrivalled Sporting Guns.

Stand unequalled in every contest. Their perform ance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun.	Exhibitor.
1st—Greener	Greener.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards, Choke Bores.

1st—Pape	Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape	Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1½ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs. 7 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

THE GREAT

London Gun Trial,

1875.

W. W. GREENER'S

Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: $75, gold; extra for extreme close shooting, $10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & C. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

Send 25 cents for large Illustrated Catalogue of Guns, and including Game Laws for all the States, and summary of Great London Gun Trial. Ready March 1st. jan13 1y

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.

Moose Calling in Nova Scotia.

I REMEMBER it was a cold Thursday morning about the middle of September, 1871, I packed myself, guns, and camp equipage on board the one-horse express wagon which carried the bi-weekly mail from Kentville to Chester on the Atlantic coast. Our route was due south, through New Ross and the Chester barrens, a narrow strip of burnt and barren land connecting the big moose and cariboo country of Western with the more famous hunting grounds of Eastern Nova Scotia. At the head of Chester Basin, that beautifully pellucid, oak-fringed, and island-dotted bay, upon whose shores it is fabled the famous Captain Kidd cached his ill-gotten treasure, we meet the coach from Halifax, going in the direction indicated by the admirable Greeley as the road to good fortune. A change is soon made, and a rapid drive of an hour and a half brings us to Mahone Bay. We have passed Gold River, dear to the salmon fisher, and the pretty stream of Petite Rivière and Mahone Bay—all now, alas! suffering from a good law ill enforced. At Mahone Bay we leave the mail coach, which pursues a circuitous route to Bridgewater *via* Lunenburg, while we again take a single trap and cut across to the broad La Hève, upon whose slaty banks stands the thriving milling and fishing town of Bridgewater. The La Hève River is celebrated for its salmon, and though much impeded by mills they still continue to offer fair sport to the angler in its waters. I had the pleasure of killing the first fish of the season in the last week in March, 1875, and met two more in a pool below Mr. Davidson's Dam, containing about 25 yards square of clear water. Our boat was moored to the ice, a horse trot was going on two miles down stream, and about twelve miles intervened between us and the green waters of the ocean. Here it may not be out of place to mention my firm conviction that the *Salmo salar*, having spawned, repair to deep water inside the twenty mile bank, all along the southwest coast of N. S., there feeding on young fish, sand eels, and shrimp, and when prompted either by the effect of the proximate Gulf Stream or their natural procreative impulse as the sun gains power with lengthening day, repair to the coast. The first river they ascend is the Medway, where Saul, the Indian, generally kills a few in the last week in February, below the Tumbling Dam, where there is nearly always open water Thence they progress north and east along the coast, entering the La Hève next. The Cold River is gained. Crossing Chester Bay they reach Ingram River, Indian River, and so on to the east of Halifax, Tangeer, St. Marys, and at last, in or about July 1st, Margaree, on the northeast side of Cape Breton. They seem to visit the rivers debouching into deep bays—*i. e.*, East River and Sackville River—much later than those which flow out on a holder coast. Those going southwest from the Medway enter Clyde River and Tusket, and so round Cape Sable *seriatim*. We next, about the last of April, find them in the Annapolis, and about the 7th of May they reach the Gasperean. Salmon River in Colchester is next gained, then the Cumberland streams, and about the 15th of June the St. John, N. B., fishermen begin their harvest. I have always thought that the heavy fish caught in the wiers on the bay shore of Kings county were the St. John River fish "feeling round" the Bay of Fundy, as they correspond in weight, (18 to 30 pounds and over) proportions, and general appearance, and the interval elapsing between their netting here and the arrival of their congeners at St. John would be about the "traveling rate" already indicated on the Atlantic coast. I advance this theory subject to correction by older and better observers of nature.

But *revenons*: Sunday will be here in two days, and I must get to camp for the day of rest. I hire my trusty Indians at Bridgewater—John, caller, and Louis, camp-keeper—and on we go all night by express. We cross the Medway, after eighteen miles drive, at Mill Village, a splendid salmon river, much fished and much cursed by logs, log-driving, (which crushes spawners and tears up the ridds) mills, dams, and sawdust. But the West Indies must have lumber, shooks, and staves, and the banks off the shore send the cod. Ah! why do people forget that, in proportion as our rivers team with fry, our deep sea banks yield their finny treasures? Liverpool is reached in, I think, ten miles. Here Mr. Appleton gives us breakfast, and starts us off Wednesday. We pass the five streams of Port Le Bear; then Mitchell's Brook, celebrated for its sea trout; Port Monton is next reached, with its dazzling white sand head and broad sedge flats, clouded later on in autumn with sea and black ducks, grebe, brant, and geese, etc. At Port Joli we change horses, and meanwhile I have a look at the curious Indian mounds where the arrow maker once plied his trade. I find plenty of "chips" and fish bones, but the axes, arrow-heads, and queer-looking harpoons have all been picked up long ago. The nags come thundering down that awful corkscrew hill. I thank fortune that I am still on terra firma. An opposing rampart of rock-bordered road having checked the impetus of our steeds, I mount the box for our last stage. Granite boulders, whin-rock, hog and barren as far as the eye can see—when will all this nothingness be found auriferous? No trees to tempt the lumberman, no soil where the horny-handed son of toil may plant his potato patch. Surely He has not made all these things for naught! We dash across Tom Tigny Bridge and pull up at Dunlap's. Before long we have agreed with Mr. D. to haul our stuff in as far as Beaver Dam Camp, and off we trudge due north upon the old Indian path which crosses to the Bay of Fundy side, the patient, head yoked oxen doing nearly three miles an hour. We reach camp at nightfall, and the hunt has begun. Here is one of the heaviest (certainly the most massive I ever visited) of all the "heaver works" of Nova Scotia. Sable River is, at times, a very heavy stream; but the cunning engineers have put forth all their ingenuity, and succeeded *usque ad delicias votorum*. On Saturday evening Louis called about half a mile from camp; but we came back early, as there was no moon, and the wind was inclined to breeze up. We found in the morning before starting on a ramble (which is never indulged in on gaining good hunting ground) that a moose had come during the night and walked over the spot on which we had called. We did not expect luck here, as it was considered too near the settlement, and John sagely observed, "wait till you see what I'll show you at Blue Hill."

And now begun our bad luck. The equinox set in with a will, and for three days it poured in bucketsful and blew a gale, raising the many brooks to such a degree that we were delayed five days, during which time a few partridges were shot and much provision and tobacco disposed of. On Friday we went onwards, all carrying our fair loads, and reached the "Hawk's" nest, nine miles. Here we determined to call. An osprey has, as long as the oldest Indian can remember, built her nest here, eighteen miles from the sea. Her old pine rampike has since blown down, and she has betaken herself to another about half a mile west from her former locus. It blew on Friday evening, but on the following morning, while John had gone back for that portion of our luggage which the heavy going had compelled us to leave, I called a fine bull. He came from the westward, crossed the path about one hundred yards off, directly between me and Louis, who was at camp cooking breakfast, and so escaped a shot. He remained about for some time, but he had got a whiff of the smoke, and went off "barking"—their custom when alarmed or suspicious. On Sunday we reached the top of Blue Hill, over which the Indian path pursues its N. N. E. direction to Bear River. By this path the contingent of Liverpool Indians marched on their way to Annapolis to join in the attack on that fort, and participate in the massacre of Bloody Creek, A. D. 1711. John and Louis have told me that their great graudfather (their father is living, aged eighty-six) who married a Salinove (probably a De la Salineaux) was one of the band. The French then disputed the ownership of this province, and Liverpool and its environs was their headquarters. Arrived at Blue Hill Camp, sixteen miles from Dunlap's, we made things snug, and got ready for a week's good hunt, whereby to atone for past inactivity. The camp was good, provisions were plenty; it was indeed a day of rest, and here, on the very path o'er which in past times the dusky savage had sped to his deed of rapine and murder; his descendants and I smoked the pipe of contentment and peace. We walked about among the giant beeches which crown the summit of this singular hill, thinking to find "mooin" climbing for his favorite beech nuts. I was extremely struck with the enormous size of the pine butts, which still remained to bear witness to the labors of the lumbermen of a past generation. Many of these would square 3 feet 6 and 4 feet. Then, as we sat after dinner enjoying our pipe, the birch partridge (*Tetrao umbellatus*) would come to pick up the fragments of potato about our camp. The moose-bird or mohawk, a species of shrike, came and greedily devoured or cached our donations of fat, even venturing into camp to attack the butter. Evening closed with a gorgeous sunset. We listened to the song of the hermit thrush or swamp robin, as it died away. The "murmuring pines and the hemlocks" gave forth now and then their peculiar sighing, shuddering sound, as if dreading the frosty air of night, and soon all was still. We sat listening for the sounds of an autumn night till about ten o'clock, but not a single cow was calling—an omen of fair weather—not an owl was heard! We had scarcely composed ourselves for sleep, when big rain drops were heard upon our split pine roof, and before we could realize the change a most terrific thunder storm broke over us. The lightning was extremely vivid, and its lurid glare lit up the woods in a manner wierd and sepulchral, conjuring up most awful shapes in every gnarled trunk or knotted windfall, while the thunder claps followed one another in deafening succession. The Indians hastily left camp, dreading the proximity of some tall pines, and took shelter further down the hill beneath some broad-topped birches. I remained in camp, truly awed by this most magnificent display of nature's pyrotechny, which, however, was gone as suddenly as it came. Subsequent experience has showed me that it is not unusual for these storms to occur three or four times a week. The surrounding country being beaver meadows or low rocky barrens, the charged clouds are naturally attracted by the lofty hill, and frequent lightnings play around its top. I observed many trees which had been struck, and found that the hackmatac or larch suffered most from lightning, its tall, tapering head acting as a conductor. One bolt, which we distinctly heard fall on this occasion, we subsequently found had struck a larch, shivering the top, and the electric current, pursuing a spiral course to the ground, had followed the roots (which grew near the surface, and at right angles to the stem, hence hackmatac knees) and laid them bare for a diameter of twenty feet.

A four A. M. on Monday we took some tea and biscuit, and giving Louis my rifle to carry, I shouldered my Westley Richards smooth-bore, and followed John to Cow-Moose Rock, a mile from camp. As soon as day appeared the low call with which the practiced Indian always commences (for, "maybe bull quite handy") goes forth—soft, smooth, seductive, ending with an alluring decadence. This had not been oft repeated—about once in twenty minutes—before Master John signals from his tree, "Dâm witcha gôôyèt"—moose comin'. I take my Riley from Louis, and telling him to hand me the cock-gun for the flying shots, remain with bated breath, and—I always own the truth—a thumping heart cluck, cluck, clucking in my throat, worse than an old hen with ducklings in the water. Meanwhile our moose comes on, at first sounding like distant chopping. His confident "Wôô-âh" gets nearer and nearer, and now we hear the horns as they brush aside the yielding boughs. Now he passes through a spruce thicket. We see the tops sway outwards, as with protruded mouffle and antlers laid back on his withers, palms to the rear, the monarch of the glen forces his way through the sturdy trees. A slight whiff of air—why does he stop? The knowing fellow sniffs the breeze. He walks round to leeward. No noise, no rush, no crash; but we know he is

gouel "De dam wh', sartain he smell us," is Louis' only ejaculation. Hardly have we got over our disappointment enough to uncock the guns, when a squirrel-call from John's tree, and a stealthy motion of his hand, cause us to look in an opposite direction. At his height from the ground he has detected the sound of a breaking twig, and immediately, upon looking around, we observe the cause. A three-year old "sneaker," afraid to "speak" while the big bull was so near, has walked up within thirty yards. I give him one ball from my Riley, and have the satisfaction of seeing him fall dead, after a short rush of about forty yards, shot through the heart. To castrate him is the Indian's first care after cutting his throat, and then he is split from brisket to hams, and disemboweled. We start the skin on each side of the opening, bed him down on each side with spruce bows, lay his horns fairly under his head, take out the kidneys and tenderloins, and leave him on his back while we return to camp to see how he tastes. According to custom, John names him "Tom Tiguy." Soon the two frying-pans are hissing on the coals. The savory onion astonishes the olfactories of our moose-birds. The coffee bubbles and boils, adding its aroma to all the good smells of woodland morning. The bread crumbs are carefully sprinkled on the fast-browning meat, and a *soupcon* of Worcester and pinch of curry added; fried potatoes, and fairly good bread and butter from Mrs. Dunlap's dairy are spread on the cleanly-hewn board, and *vis a vis* to my dark-skinned friends, I squat down on the fresh fir boughs to eat a breakfast that even Lucullus never conceived nor imagined. About eleven o'clock we return to our moose; he is skinned and quartered. Being but a three-year old his horns are cut off with *os frontis* attached. The hide is stretched on a cross-pole, hair side in, to dry, and the meat is hung on the lopped branches of an adjacent pine. The fierce autumnal sun soon envelops the meat in a dry membranous cuticle, impervious to fly blows, and here (bar rain or accident) it can remain a week without taint. The offal is then buried deep in the moss and rocked over, and we trudge back to camp laden with mouffle, lip, steak, and marrow-bones. A gorgeous dinner follows—soup, a steak with marrow, and boiled potatoes, a roast partridge, an apple or two found in the potato bag, chocolate, and the post prandial pipe go to satisfy the cravings of nature, and while Louis washes up, John and I discuss our next move. We elect to go about one and a half miles from camp in the direction of Tom Tiguy Lake, and at five o'clock P. M. we start, taking coffee for supper and early breakfast, and our blankets for the night.

About six o'clock it was dead calm, and having reached our destination, Tom Tigny landing place, John mounts his "callin' tree," and the enchantment begins. We soon get two answers, both in the same direction. One is evidently coming confidently, and in proportion as he nears us the rival seems to speak louder and louder. The whole is soon explained. The bawl of a cow is heard! The master bull immediately ceases to advance towards us and hastens back to his fiance whom the other moose is rapidly closing with, but not with sufficient speed to anticipate the return of the favorite. Now begins a battle royal. As the rivals approach the object of "their amorous wish" their challenges grow louder and more frequent, and soon the crash and rattle of horns (for the sound much resembles file fining of musketry) is heard. The combatants separate and close again repeatedly, till after several sharp charges one is heard retreating, rapidly pursued by his victorious foe. We hear the self satisfied grunts of the latter as he rejoins the partner of his joys, whose short sharp bawl soon proclaims the reward of valor. John comes down from his tree, well satisfied with the row he has kicked up, and says: "Sartain good many sneakers roun' dat ole cow. Pretty big moose got likin'; maybo he'll come mornin'; if big one don't come we'll creep dat ole —— and kill dat master bull when wind rises." Our lean-to is very snug, and though the night was cold we slept well. John sees the morning star, and wakes camp up early; and while Louis gets a cup of coffee ready, we light a pipe (why is it every one can smoke before breakfast in the woods)? and plan how to manage our moose if he comes this way or that. The morning is very cold, and we are certain, therefore, of calling our quarry without much delay. At the first call we get no answer, and in less than half an hour we can almost see him, so close has he come. We can hear his huge lips smack as he opens his mouth to answer, and soon a puff of vapor is emitted from the edge of the copse where he stands to listen for the last time, as with a loud "woogh" a huge bull with mane erect and frothing mouth, his sides steaming with melted hoar frost, steps boldly forth upon the little glade on which we are calling. He stands a moment and sniffs the ground for tracks, looking fiercely and expectantly around; another moment, and with head thrown forward, and bristles erect, he advances across the open, loudly challenging. He is broadside on now, and just ten yards from the clump of wild azalea, behind which Louis and I are concealed. John stops him by giving one "bull call." He looks round ready to face his rival. "Now," says Louis, and the old double-barrel rings out right and left. Away he goes. No answer. No "barking" now, but plenty of crashing and noise as he tears through the low maples and brushwood. After a short pursuit we come up to him, the blood gushing from his mouth as he glares around in the agony of death. If he moves another step he falls. Louis sees the bullet holes through and through, just about two inches behind the heart, and close together, and knows his lungs are full of blood. He walks up behind him and gives him a shove with the butt of the rifle. Down he goes, and dies without a struggle. We pursue the same course with our meat, and John calls our second moose "Morning Glory." I'm thinking his heart turned back from the flesh pots of Blue Hill to the firewater of the Bridgewater bar when he so appositely named that moose. On our return to camp we found Peter, Paul, and his son Tom, and right glad we were to give them camp room. Peter could help us on shares, and Tom would be a good hand to run out for teams when we had got through our hunt. Being now strong handed we determined to change camp; so, taking all our equipage, we moved further in along the path about a mile and a half, and spread our cotton lean-to on the borders of an immense bog about two miles square, in the centre of which lies Mossy Lake, just half way between Blue Hill and another elevation of about the same altitude, called, from its resemblance to the shape of that animal, "The Porcupine." Flights of black duck visit this lake every evening, and, as there were several beaver houses upon it, we promised ourselves good sport on windy evenings, when calling was useless. Never shall I forget the beauty of the sunset I here had the fortune to behold. Far to the north rose The Porcupine, and on the south the dark foliage of Blue Hill bounded our vision, while away east and west lay the low lands between us and Rossiguol on the one hand, and Jordan River on the other. This is the chosen habitat of the moose in autumn, and upon the vast bogs there abounding herds of caribou take up their winter quarters. The sun went down in gold, while the bright blue of the sky overhead bleuding with the glow of departing day conveyed to the eye those magic hues of pale green which are only to be seen in a North American autumn. Rose-colored clouds passed slowly over from the west which gradually assumed all the tints of salmon color as they neared the eastern horizon. The maples which fringed the happy hunting ground were now resplendent in all their shades of crimson, beautifully contrasting with the yellows of the frost-nipped birches, the various greens of the spruce and hemlock, the ruddy brown of the oak, and the dark maroon of the sumach and moosewood; beneath all these varying colors stretched the sombre bog, relieved here and there by islands of boulders, stunted spruce and alder whose tops caught the glory of the glowing west and added a charm to the landscape. The heavy hammering of the great redheaded woodpecker could be heard, as afar off in the denser woods he attacked oak or hemlock with his formidable bill; anon the spruce partridge whirrs off on rapid wing to some friendly shelter; numberless ducks come flashing into the stilly lake, or pursue one another with loud quacks upon its surface; and then we hear the beaver, on the very edge of night, as he now and then sounds his alarum with blows of his powerful tail. All combine to form a picture of repose, and quiet and solemn grandeur most entrancing to the lover of the beautiful in nature.

John, intent on hunting, had been calling since six o'clock, and tea having been steeped, and pipes lighted we other four sat around our farthing dip and applied our minds to five and forties. On a sudden Louis assumed an attentive attitude and laconically observing "John's coaxin'" handed me my moccasins. We stealthily left camp, and, carefully picking our way through the thicket, emerged on the bog, where we found John seated midway between two diverging moose paths, each being in easy distance, say forty yards. John whispered "old bull very handy, comin' very sly, stoppin' every two tree steps, listen all time." After we had made ourselves as comfortable as the wet bog would permit, John got up, and taking a few steps up and down the soggy bog, caused a peculiar sucking sound to proceed from the pressure of his moccasins, then with his birch bark call close to the ground he emits a low plaintive cow-call, answering almost immediately his own call by calling like a young bull, "bôk bôk." Immediately a bold defiant challenge is heard from the foot of Blue Hill, and in five minutes I hear the sucking sound of his feet in the moss, and as I lie full length on the bog I see a figure blacker than the blackness of night (for there was no moon) moving between me and the northwest sky line on the right hand path. John stops him with a bull call, and trusting to the well-known "feel" of my old double barrel smooth bore, and aiming low, I let go both barrels in quick succession. The moose immediately wheels and makes for woods. "Good sign," says John; "he don't bark any, and takes back track, guess you hit him four-quarters. He run right off, too; hit pretty bad." We sent Tom to camp for the torches, which had been got ready for water carrying in the night, and took the path to the edge of the woods. In the darkness, John, by torch, found the slippery blood on the dew-besprinkled bushes, he tasted it to make sure, he felt the height from the ground and said, "guess one ball pretty high, odder one must have broke leg." The torches soon came, and it was comparatively easy to follow the trail. About 150 yards off we found our moose lying down. The off foreleg was broken close below the brisket, and he had a bullet through the shoulder blades about twelve inches down. Peter had brought his gun out, so, while John held the torch, I ordered him to give the *coup de grace*. The wounded beast had lifted his head in terror and gazed at us, and whether the torch flickered, or the movement of the head as he again laid it down destroyed the aim, I knew not, yet Peter's bullet missed the shot between eye and ear, and cut the jugular vein. Now came the only occasion on which I found the "far-offishness of *cervus alces* preferable to his proximity." In an instant the moose had risen to his feet, the Indians had hidden like partridges among the leaves and behind the stumps, and John, torch in hand, was "marvelling" off through those woods with a degree of style and action wonderful to behold I "hooked it" after John as the torchlight enabled me to see the sticks and protect my eyes, but the devil of it was, the moose chose the same pilot. So here I was clearly in view, between two fires. I never was a good "sprinter," but I feel that I must have shown a wonderful flight of speed that night, and happening to have the bark moose-call in my hand, its friction against the bushes, closely resembling the sound of brushing horns, would as I closed on the fleeing torch-bearer impel him to renewed exertions. This went on for about 200 yards, when the torch getting low, I ran into a white alder bush, and remained fast. I called out "John, he's on top of me," and drawing my knife, felt, as I could run no more, that I'd better fight it out.

Finding his pursuer was I, not the moose, John immediately ran back, and found me as above described. We listened for the moose, but heard no sound. Moving cautiously back about twenty yards we found an old dead birch, from whose trunk and branches hung quantities of dry bark; we lit this, and as the fire arose from the ground, lighting up "the dim aisles of the forest," and shedding its radiance around the space of at least an acre, we espied the moose (who was forthwith named "the Lamplighter") quite dead, about thirty yards off. Peter's shot, though not immediately fatal, had bled him to weakness, and failing down he had bled to death. We did for him a "*more Indico*" before alluded to, gralloched him, and left him on his back to be further disposed of after morning calling. I had now killed three moose in two days, but though the second and third were large animals, their heads were not considered good enough for preservation entire. They had all belonged to the brown or long-legged type of moose, and as yet not one of the shy black, short-legged, swamp breed, had presented himself. There is little doubt but that there are two varieties of moose, as there certainly are among the bears of Nova Scotia, of whom are the brown, long-legged, fierce, cattle stealing, and the jet black and shorter-legged breeds which are less fierce, and more purely vegetarian and honey-loving in their tastes. My anxiety to get a really fine head remained now to be gratified in a most singular manner.

On Wednesday morning we were up with the morning star, and off over the bog to an island nearer its western extremity. The wily John was soon pursuing all the seductions of his art, but alas and in vain! About eight o'clock I looked up to the extreme west of the bog, and saw for a moment over its rounding top the flash of a pair of *wet* horns in the morning sun. I told John, but he was sceptical, and so about nine o'clock we went back to camp and had breakfast. At ten o'clock we were all at work about "The Lamplighter," and having hung the quarters up, one of the men was engaged in cutting down a small spruce for a cross pole for the skin, when the chopping of the axe was immediately answered, about 400 yards off to windward, by the thick, guttural "woogh" of a big fat bull. I had put on my ammunition boots (an exceedingly good walking boot, provided to the British soldiers) and was not equipped for creeping, and it was clear that, as the wind had risen a little, the moose must be met, or he would get round to leeward of our present locus. So John took the call, and going back about 300 yards, made a racket resembling the "mutual confidences" of amorous mates; alternately calling "bull" and "cow" and now and then breaking a branch. I knew that so late in the day our moose would keep to the woods, so taking an oblique course towards and across the locality of his first answer, I kept onward to leeward of his probable course; in 200 yards Louis, who carried my rifle, saw him at sixty yards through an opening. He had heard us, turned, and was standing tail to, with his splendid head half turned to listen. I took the rifle, and saw at a glance that the hip shot was my only chance; his huge hips and side protected his head, so dropping on my knee I aimed at the anus, and carefully "drifting" (a term used in target shooting here—B. S.) off about three inches to the left, pulled. When the smoke lifted I saw that he was down. The bullet had broken hip and pelvis, and followed the back-bone to the withers. When we got up to him all but his brain was dead, and in a few moments more *"fait"* was all that could have been said.

This moose deserves more than passing notice, and his head is now, I believe, in the rooms of the Gun Club at Stephen Grant's, St. James' street, London, for sale. I wish I had it here for transmission to the Centennial as the proportions were very fine and Mr. Thos. Egan, of Halifax, set it up in a truly natural manner. The bull was about six years old and extremely large and fat. The prongs were all clearly indicated, fifteen on one side and fourteen on the other. Brow, or fighting prongs, seventeen inches long; extreme width, four feet eleven inches. The palms, or blades were even, uniform, upright, and very thin. The skin as black as jet, and the *bell* well developed. We made a V shaped incision from the rear of either horn, meeting well down on the back of the neck; skinning upwards from the point of the V we reached the horns and worked over the forehead round the horns to the eyes, also well down round the neck; then beginning at mouffle and under lip, we worked backwards round the head till we met our work upwards; we then cut off the neck at the withers, and taking off the *ostrontis* with the horns, slipped the skin off the neck and head. This was salted and wrapped round the forehead, and John having shouldered it, and gained the open bog, forgot his dignity and "played bull," hooking bushes, &c., all the way back to camp. This head was pronounced the finest that had been in Halifax for thirty years, even surpassing the specimen presented to the Prince of Wales. Suffice it to say, it was too large for the hall of an ordinary country house, and in an evil, and perhaps impecunious moment, I put it in the market.

My hunt was now over, and it only remained to "get out" our meat. Tom was dispatched to Dunlap's forthwith, and on the Friday evening returned with two strong teams. Meanwhile Peter and I had some beaver shooting, and on the morning of our departure homeward John called two more moose, but I declined to fire as we had all the meat we could manage.

My letter has been so very long that I feel I have been presuming too much on the patience of your readers, so I will bring it to a close. I cannot lay down my pen without a few observations of a general nature. In the first place there is a thorough and complete freshening up of the man in thus, *"cauris expeditus,"* returning to a state of nature at a season of the year when she offers her richest and choicest inducements to recreation. The bracing breeze, the bright warm day, the invigorating night. A noble quarry, whose senses for self protection are extremely acute, and whose pursuit is not without that suspicion of danger, which adds a charm to sport. We kill him at a season when his flesh is most edible, and have the satisfaction of knowing that we are not thereby diminishing the main stock. And then cast your eyes around upon the beauties which nature spreads before you. The sunset, the ever varying forest, the crystal lake, the rushing stream, the abounding fauna and flora of the woods. Doctors may prescribe the sea side, or the reacting effect of ocean travel. Give me as a panacea my trusty rifle and my faithful Indian, the resinous smell of the pine, the fresh camp bed and the delightful abandon of woodland life in Autumn. How keenly we appreciate the comforts of home after such a holiday, with what pleasures we recount our adventures or observations to our little blue-eyed audience, as they gather at our knee to listen to our tale. To have hunted, is indeed, delightful to reflect upon—to hunt again is, I trust, a pleasure to come.

B. S.

Kentville, Nova Scotia.

GIANT PEAR TREES IN TEXAS.—Standing in the orchard of a Mr. Ellis, in the old Spanish town of Elcearia, in the Valley of the Rio Grande, are some of the largest pear trees in the world. Prof. S. B. Buckley, State Geologist of Texas, measured some of these trees last summer, and he gives their dimensions in his Report for 1875 as follows: "Some have a circumference of from 8 to upwards of 9 feet at 3 feet from the ground. * * * Col. J. M. More, of my party, measured one which has a circumference of 10 feet, at a height of 6 feet from the ground, a spread of limbs of more than 60 feet, and estimated height of about 50 feet, and is pyramidal in shape." These are giant natural curiosities, and their sizes show that they must have been planted long ago by the Spaniards, who, at a very early period, first settled this Upper Rio Grande Valley country.

The Horse and the Course.

"HORSE TALK."

HORSE talk must have been a very ancient pastime. It is impossible that any nation or people should have possessed horses without admiring them, and admiring, they must have extolled them. Homer, and the writer of the book of Job, may be mentioned as among the earliest who indulged in "horse talk." And they are usually referred to as having made the most "splendid bursts" in that line, that have been "recorded;" though, to our apprehension, Will Shakspeare beats them both "under the wire" by several "lengths."

In the days of Homer and Job, the horse would seem to have been used chiefly in war. Homer makes frequent mention of the *mule* for *labor*, and does not disdain its use, on occasions of ceremony and state. Nausicaa, the Phaeacian Princess, droye a twelve-in-hand mule-team to the river "a washing," where she discovered Ulysses, then recently cast upon her shores. After her damsels had completed the washing,

> "Now, on return, her care Nausicaa bends,
> The robes resumes, the glittering car ascends,
> For blooming o'er the field, and as she pressed,
> The splendid seat, the listening chief addressed;"

From which it would seem that she didn't bestride the "nigh wheeler." Explaining, to "the much enduring man," how it might "make a talk," if he should go along with her, she directs him how to follow at a distance, and how to find the King and Queen in the city.

> "She added not, but waving, as she wheeled,
> The silver scourge, it glittered o'er the field;
> With skill the virgin guides the embroidered rein, &c. * * *"

From which, it would also seem, that she drove her "mule-team" with a whip and a single rein, even as the Pennsylvania Dutchman do, to this day.

It is a mooted question, is it not, in horse circles *now*, whether mares, horses, or geldings bear the palm for speed and bottom? Homer, in the games after the funeral of Patroclus, makes the steeds of Diomed win the first prize over Eumelus by divine interference only. In the second book of the Iliad—we use Pope's translation—we find

> "Eumelus' mares were foremost in the chase,
> As eagles fleet, and of Pheretrian race;
> Bred where Peiria's fruitful fountains flow,
> And trained by him who bears the silver bow;
> Fierce in the flight their nostrils breathed a flame,
> Their height, their color, and their age the same;
> O'er fields of death they whirl the rapid car,
> And break the ranks, and thunder through the war."

In describing the coming in "on the home stretch" in the games above mentioned, Pope has it:—

> "First flew Eumelus on Pheretrian steeds,
> With those of Troy, bold Diomed succeeds," etc.

We think it may be taken for granted that Eumelus still drives his mares, though the language bears another construction. Antilochus, son of Nestor, drove his gov'ner's "old plugs," and actually made "a good second" by *wisdom* and not by swiftness. He crowded his antagonist off the track. Even by this stroke of wisdom he but just landed a winner, by the skin of his teeth, over Menelaus, with his Podargus and Agamemnon's mare Aethe. In urging his "plugs," he adjures them not to be "vanquished by a female foe." So when old Uncle John Harper's great horse and hope—Hubbard—broke down in a ruin strife with an equine lass, and the old veteran led him sorrowfully off the course, the most sorrowful part of it all was that he had been "beaten by a d——d mare."

As to colors, Priam's chariot team was milk-white. So were the steeds of Rhesus, stolen—captured, we mean—by Ulysses and Diomed; and those of Asius were yellow.

As to blood or race, these seem to have been held in high estimation. There were strains of "Immortal Coursers."

> "Xanthus and Balius of immortal breed,
> Sprung from the wind, and like the wind in speed,
> Whom the winged Harpy, swift Podargo, bore,
> By Zephyr pregnant on the breezy shore."

With these was, harnessed to the chariot of Achilles, "swift Pedasus."

> "Who, like in strength, in swiftness, and in grace,
> A mortal courser, matched the immortal race"

Dutchman and Flora Temple were at first thought to be of mortal race, but diligent inquiry at last furnished them with sufficient celestial blood to excuse their performances. Most likely, after all, Pedasus was a "catch colt." Those immortals were "sly dogs." In these funeral games these immortals were "barred," as it was thought to be hardly "the thing" for Achilles to propose the prizes, and then "go for 'em" with his "coursers of celestial breed." When Achilles reproached them for having Patroclus on the field, "the generous Xanthus," like Bashaw's "critter," broke "eternal silence" and prophesied. The Saracens, in their conquering career, divided the spoil—one fifth to the public treasury and the remainder among the soldiers. After the great battle of Yermouk, Abu Obeidah, it is related, made division. To a horseman he gave thrice as much as to a footman, and made a further difference between those horses which were of the right Arabian breed (which they looked upon to be far the best) and those that were not, allowing twice as much to the former as to the latter. It seems the "cold bloods" complained, but Abu Obeidah told them the Prophet had done the same, after the battle of Khaibar, which, upon appeal made to Omar, (then caliph) was confirmed. H.

DIGESTION IN THE HORSE.—The horses' stomach has a capacity of about sixteen quarts, while that of the ox has 250; in the intestines this proportion is reversed, the horse having a capacity of 190 quarts, against 100 of the ox. The ox and most other animals have a gall bladder for the retention of a part of the bile secreted in the intervals of digestion; the horse has none and the bile flows directly into the intestine as fast as secreted. This construction of the digestive apparatus indicates that the horse was formed to eat slowly and digest continually bulky and innutritious food. When fed on hay it passes very rapidly through the stomach into the intestine. The horse can eat but about five pounds of hay in an hour, which is charged during mastication with four times its weight of saliva. Now, the stomach, to digest well, will contain but about ten quarts, and when the animal eats one-third of his daily ration, or seven pounds, in one and one-half hours, he has swallowed, at least two stomachs full of hay and saliva—one of these having passed into the intestine. Observation has shown that the food is passed to the intestine by the stomach in the order in which it is received. If we feed a horse six quarts of oats it will just about fill his stomach, and if, as soon as he finishes this we feed him the above ration of seven pounds of hay, he will eat sufficient in three quarters of an hour to have forced the oats entirely out of the stomach into the intestine. As it is the office of the stomach to digest the nitrogenous parts of the food, and as a stomach full of oats contains four or five times as much of these as the same amount of hay, it is certain that either the stomach must secrete the gastric juice five times as fast, which is hardly possible, or it must retain this food five times as long. By feeding the oats first it can only be retained long enough for the proper digestion of hay, consequently it seems logical, when feeding a concentrated food like oats with a bulky one like hay, to feed the latter first. —*Exchange.*

AMERICAN HORSES IN ENGLAND.—Notwithstanding the fact that Mr. Sanford's horses made anything but a creditable display on their first public appearance in England, owing probably to change of climate and indifferent training, they have been persevered with, and have gradually crept into such prominent places that we may expect any day to hear of their having won a good race. On the 1st inst. Preakness ran second in the High Level Handicap at Epsom, carrying 121 pounds, which was the top weight, the winner being the five-year-old Cato. On the next day Mate finished third for the Epsom cup, a handicap of one mile, being beaten by Dolham, five years, the winner, to whom he was giving two pounds, and Wisdom, three years, to whom he was conceding twenty-one pounds. There were twelve starters, and among them some capital performers.

THE DERBY.—On the 31st ult., the greatest event of the racing year, the "Darby," was decided for the ninety-seventh time, on Epsom Downs. The first favorite for the race was Petrarch, the winner of the other great three year old event, the Two Thousand Guineas, a few weeks since, owned by Lord Dupplin; but the winner turned up in Mr. Baltuzzis' Kisber, known previous to the race as the Mineral Colt, the favorite coming in fourth. Petrarch cost his present owner some $65,000, and the race was looked upon as a certainty for him. It is estimated that five hundred thousand persons were present the day of the great race.

THE MUSTANG RACING.—George Parker having again failed in his attempt at riding 305 miles in 15 hours, and the managers of the affair having netted about all the gate money possible here, it is a relief to know that mustang racing is to be transferred to fresh fields and pastures new. Parker and his associates should join Sergeant Bates, Weston, and the other "hippodromers," and start on a circuit.

National Pastimes.

CRICKET.

A cricket club has been organized at St. Louis, Mo., with the following officers: President, S. M. Griffen; Vice President, Alex. Gordon; Secretary and Treasurer, G. F. Baker; Committee on By-laws and Constitution, Messrs. Gordon, Baker and Webb; Executive Committee, Messrs. Lindley, Webb, Julian, Dr. Day, and Warren. It is called the Union Club, of St. Louis.

GERMANTOWN VS. YOUNG AMERICA.—These clubs began a play match on Saturday, 3d inst., at Germantown, that has, so far, displayed the best cricket of the season. The teams are good ones and the scores good. The fielding of the Germantowns was ahead of their opponents, but both sides missed several chances. D. S. Newhall's bowling for the Young America needs no further comment than that eight wickets fell before him for 37 runs. Fox's slow round arms were effective. The first inniug resulted in a score of 102 for the Young America and 90 for the Germantown. The Germantown in their second inning have scored 71 runs for four wickets. For the Germantown, Brewster, Tom and Joe Hargreaves and Fox are credited with the bulk of the score, while for the Young America John Large added 26; Dan Newhall, 37; George Newhall, 15; and R. Newhall, 12 runs. The game will be continued on Monday, 12th inst, at half-past one. The resnlt is still in doubt.

—The Olympic Club of Philadelphia—the Knickerboeker of the Quaker City—had a re-nnion on their grounds on June 2d. The day was glorious for the occasion, and quite a number of the veteran members—who take a hand now and then in the pleasant and healthful pastime—were present, merely as spectators, and others indulging. Among the more familiar faces were: Bettle Paul, Mr. Draper, Dr. Neal, F. DeB. Richards, Geo. Morris, Mr. Allen, Robert H. Adams, Chas. Anspach, Al. Halbach, Wm. Scott, and others. Among the invited guests, who actively participated in the afternoon's fun, were Hicks Hayhurst, Al. Reach, Dan Klinefelder, and Al. Johnston.

STEVENS INSTITUTE.—The annual athletic games of this institute were held on the grounds of the St. George's Cricket Club, at Hoboken, on Saturday last. The winners of the principal events were as follows:—

One Mile Walk.—F. Foote, 1st; time 8m. 55s.
One Hundred Yard Dash.—J. O. Bucrke; time 12½.
Putting the Stone (16 lbs.).—Won by J. O. Bucrke; distance 29ft. 11in.
Throwing the Base Ball.—Won by H. W. Hazard; distance 336ft.
Half Mile Run.—Won by J. R. Stevens; time 2m. 23½s.
Standing High Jump.—Won by J. Kingsland; height 4ft.
Running High Jump.—Won by J. W. Hazard; height 4ft. 11in.
Standing Long Jump.—J. Kingsland was the only entry, and jumped 8ft. 6in.
Running Long Jump.—Won by H. W. Hazard; distance 16ft.

BOWDOIN COLLEGE.—June 3d was the day appointed for the athletic sports of this college. The hurdle race was won by Varney in 14½s. Throwing the heavy hammer, 16 pounds, was won by Knight, scoring 45 1-16ft. The two mile walk was awarded to Morrill; who accomplished it in 17m. 53s. In a three-legged race, Acorn and Henderson were victorions in 15s. In a running long jump, C. E. Cobb was victor, making 17ft. 5in. The 100 yard dash was awarded to Leavitt, who made the distance in 11s. The standing high jump was won by C. E. Cobb, who made 4ft. 2in. The half-mile walk was won by Morrill, time 3.27½. Throwing a base ball 308 feet, by Metcalf, made him the victor. The potato race was awarded to Varney; time 7.1¼.

DARTMOUTH COLLEGE.—The spring athletic sports of this college were held on Wednesday and Thursday of last week. The winners in the various events were as follows:—

Throwing the Heavy Hammer.—Frost; distance, 67ft. 3½in.
Best Three Jumps.—Stevens; distance, 31ft. 11in.
Putting the Weight.—Prescott; distance 31ft.
One Mile Walk.—Eager; time, 7:55.
One Mile Run.—Stimson; time, 5m. 5s.
Running Long Jump.—R. Young; distance, 17ft. 3in.
Running High Jump.—R. Dana; distance 5ft.
One-Fourth Mile Run.—Young, 54½.
Three Legged Race.—One hundred yards, won by Messrs. Hay and Goodhue.

ST. PAUL'S SCHOOL, CONCORD, N. H.—The annual athletic sports of the above school were held on the 30th ult., the various events resulting as follows:—

Throwing the Cricket Ball.—First, A. Grain, 309ft.
Hop, Step and Jump.—First, A. Grain, 40ft. 8in.
Putting the Weight.—E. D. Appleton, 30ft. 3in.
Throwing the Hammer.—A. P. Thayer, 85ft. 10in.
Junior Quarter-Mile Race.—First, F. H. Hall; time, 1m. 6½s.
Three-Mile Walk.—H. Van Rensselaer; time, 23m. 32½s.
Standing Long Jump.—A. Grain, 9ft. 5½in.
Senior High Jump.—First, A. Grain, 5ft. 3in.
Junior 100 Yards.—First, L. Jacob; time 11m 4½s.
Senior 100 Yards.—First, J. D. Cheever; time 1.1s.
Junior Hurdle Race.—First, E. H. Nicoll; time, 19 4-5s.
Junior Half-Mile.—First, L. Jacob; time, 2m. 3½s.
Quarter-Mile.—First, R. C. Drayton; time, 57 1-10s.
Senior Hurdle Race.—First, E. H. Nicoll; time, 18½s.
Long Jump.—First, A. Grain, 17ft. 2in.
Junior High Jump.—First, G. S. Rossen, 4ft. 6½ in.
Mile Race.—First, R. C. Drayton; time, 5m. 28s.

BASE BALL.

The close of the second week's play of the eastern tour of the four western nines shows the West to be still in the van, they leading the four eastern clubs by six victories out of the twenty-four games played on the tour up to June 5th, as the appended table shows:—

West.	Won.	Lost.	East.	Won.	Lost.
Chicago	5	1	Hartford	3	3
St. Louis	5	1	Boston	3	3
Louisville	3	3	Mutual	3	3
Cincinnati	1	5	Athletic	1	5
Total	14	10	Total	10	14

In the total games won by the four clubs of each section the record stands as follows:—

West.	Won.	Lost.	East	Won.	Lost.
Chicago	15	3	Hartford	12	4
St. Louis	12	5	Boston	9	9
Louisville	7	11	Mutual	5	11
Cincinnati	4	14	Athletic	5	12
Total	38	34	Total	32	36

The individual record as cont ained in the season championship table up to June 5th is as follows;—

Clubs.	Games played.	Games won.	Games lost.	Games drawn.
Chicago	18	15	3	0
Hartford	16	12	4	0
St. Louis	18	12	6	0
Boston	18	9	9	0
Louisville	18	7	11	1
Mutual	17	6	11	0
Athletic	17	5	12	1
Cincinnati	18	4	14	0
Total	140	70	70	2

By this it will be seen that the fight for the leading position has become very close between Chicago, Hartford, and St. Louis, and the close of the series of games East vs. West on June 17th will decide, probably, which of the two nines, Hartford or St. Louis, will close the tour by taking second place, there being little doubt of Chicago taking first place.

—The college event of the past week was the first meeting between Yale and Harvard, which took place on Jarvis' field, Cambridge, on June 3d. The result was as follows:—

Name.	Score.	Total.
Harvard	0 0 0 0 1 0 3 0	4
Yale	0 0 0 0 1 0 0 2	3

The return match takes place in New Haven when another close and exciting contest may be expected.

—This week the Cincinnatis play the the Mutuals on the Union Grounds on Tuesday, Thursday, and Saturday. The Chicagos go to Philadelphia for a week's play; the St. Louis to Boston, and the Lonisville to Hartford.

—But little fine play was shown in the regular amateur arena the past week, double figure scores marking the games played as a general thing. The record of model games since our last table is as follows:—

May 25—St. Louis vs. Mutual, at Brooklyn	2 to 0
May 27—Taunton vs. Fall River, at Fall River	2 to 0
May 25—Louisville vs. Athletic, at Philadelphia, (14 innings)	2 to 2
May 23—Louisville vs. Athletic, at Philadelphia	3 to 1
June 1—Louisville vs. Resolute, at Elizabeth	3 to 1
June 1—Fall River vs. Taunton, at Taunton	3 to 2
June 1—Cincinnati vs. New Haven, at New Haven	3 to 2
May 24—Star (of Syracuse) vs. Rhode Island, at Providence	4 to 0
May 25—Boston vs. Cincinnati, at Boston, (10 innings)	4 to 0
May 25—Hartford vs. Chicago, at Hartford	4 to 1
May 27—Alaska vs. Nameless, at Brooklyn	4 to 2
May 19—Star vs. Walnut Hills, at Covington	4 to 3
June 3—Harvard vs. Cambridge, at Boston	4 to 3
May 30—Chicago vs. Boston, at Boston	5 to 1
June 1—Mutual vs. Louisville, at Brooklyn	5 to 1
May 23—Live Oak vs. Lowell, at Lynn	5 to 3
May 26—Mutual vs. Maple Leaf, at Jackson	5 to 4
May 26—Webster vs. Osceola, at Cambridge	5 to 4

—The model games have become so numerous that we have been obliged to withdraw our limit from nine runs to five.

CREEPING VINES.—In ancient gardening there used to be a distinction between climbers and creepers. The term "vine" was unknown in connection with twining plants. It is purely an Americanism as we understand it. In the old world a vine was, and probably is yet, the grape-vine, simply and nothing more. A plant which twined round some other thing for support was a climbing plant, and that which clung by roots to walls or trees was a creeper. The distinction has been lost sight of in the general use of our word vine, which is fast becoming associated with potato tops, and even tomato stalks. The term climber and creeper is, however, so distinctive that it would be well to preserve them.—*Germantown Telegraph.*

Fish Culture.

—Seth Green has two men at New Hamburg, on the Hudson River, engaged in shad and sturgeon hatching; they are turning quantities of young shad into the river every night.

LAND LOCKED SALMON IN VIRGINIA.—Dr. Ellzey, of Blacksburg, Va., sends the following account of a trip to "Mountain Lake," with some fry of the land-locked salmon. We trust the efforts of the Virginia Commissioners to introduce these fish into the Old Dominion will be successful. We quote:—

"The fish were sent to me from Lexington, where they were hatched, by Col. McDonald, in charge of Mr. William F. Page, who studied the practical part of fish culture under Fred. Mather, last fall and winter. Mr. Page has a large share of that natural good sense for which Mr. Mather is so distinguished. The fish arrived here on the mail-coach last Thursday evening about 6¼ o'clock. Mr. Page gave them a sheeps kidney for supper and some fresh water every hour during the night. Early next morning, taking with me Mr. Page and Costin, one of my students, and accompanied by my friend Dr. Ellet, we set out for the Lake in a two horse jersey. The lake is from hence sixteen miles distant, and above us some two thousand feet. We must ascend Smith Mountain, Gap Mountain and Salt Pond Mountain, near the summit of which last is "Salt Pond," formerly so-called, now called Mountain Lake.

In good time for dinner we arrived at the door of the hospitable mansion of Mrs. General Haupt, mistress of Mountain Lake. Mr. Page quickly placed his fry in their new home, not one of them having been lost or apparently made unhappy by their long overland trip.

THE FRESH WATER FISH OF VIRGINIA.

THE gamest and the most aristocratic of all our fish is trout, found in our mountain streams. The Southern club is the most abundant fish in mill ponds, and also frequents canals and quiet stretches of water in rivers. It was brought from the South, where it greatly abounds in the lakes, and is called the lake trout—a gross misnomer, even greater than the name here given of club. It is a bass and very closely allied to the black bass of the Ohio, which has been introduced into the Potomac. There are some slight but very distinct organic differences, which, while showing that both are of the same genus, they differ in species. They bite and watch their young alike; but the club likes still water, and is not averse to mud, while the black bass prefers running water and rocky bottoms. There is a great variety of the perch, the silver or speckled perch, called at the North strawberry bass and calico bass; the sun perch and yellow-belly, found both in ponds and rivers; the black perch, sometimes called tobacco-boxes, found in ponds; the bachelor or sand perch, a very fine fish, which has the appearance of being a cross between the yellow belly and the silver. It is almost round as a plate, and only found in the clear ponds in tide-water district, in deep water and on sandy bottoms. The red-eye and red belly, both fine and game, not found in any stream as far north as the Appomattox, and mostly abound in the tributaries of the Chowan and Roanoke. The red-belly, or sometimes called red-breast, is famous in the Nottoway. The white perch, which attends the shad in the spring, and with which tide-water is crowded at that time. One of the finest pan fishes.

The cat-fish, mud, channel and New River—the latter so important in that part of Virginia in which it abounds as to amount almost to a ruling influence in politics. It sometimes reaches the weight of fifty or sixty pounds, and is highly valued. The mud cat is detestable and disgusting. The channel cat is of a finer strain, with a glistening dark gray back, a white belly and fins that seem made of the finest steel. He is the fellow for chowder.

Of all the loathsome fish that swim in our fresh waters that variety of the mullet may be pronounced the most repulsive that frequents muddy streams and bodies of water like our basin here in Richmond. There are varieties of this fish that are by no means so offensive as the kind we speak of. There is one that the boys call the stone-toater, found in running streams with pebbly bottoms. There is another kind caught in James River that is very respectable. It is a nice, clean-looking fish. There is a variety called "the red-horse," caught in Dan River and perhaps other waters. The Danville people esteem it highly, for it is one of the few fish they have. All the varieties of the mullet are bony. The roach or mill-dace has the merit, like the minnow (abundant in all our streams and ponds), of being good bait for larger fish. The rock fish is one of our most esteemed fish. It varies greatly in size. At some seasons it bites freely at the hook, and is worthy to be classed among the game fish. Generally it is caught in seines, and frequently attains very large proportions. The ring-perch (not mentioned above) is long, slim, active and strong. It is red about the gills, and bites with great vigor. But a dryer and more tasteless fish does not swim in our waters, unless we accept the gar. The pike or jack-fish, is the fresh-water shark. It is the scourage of mill-ponds and streams, destroying right and left. The carp is a very fine fish, and known under different names in different portions of the State. In some it is called the white fish, in others the sucker, in others the round fish, etc. By whatever name called, and wherever found, it is greatly esteemed for its quiet virtues and its excellent table qualities.

The eel and the skilpot are the dread of mill pond fishermen. The sturgeon is a fish that one either loves very much or hates very much. The choice parts of a young jack sturgeon are delicious, either baked or stuffed "with yerbs," or served up in stakes. They are good for breakfast, dinner or supper, and either warm or cold. The people on James River brag of their sturgeon, but those living on the Rappahannock claim that there are no sturgeon comparable with theirs. The Potomac sturgeon is rather too coarse, and farther North it is coarser still. Besides, they don't seem to have acquired the art of cooking it properly at the North. In fish regions the sturgeon is called the poor man's beef.

We include among the varieties mentioned, several that come from the sea to the fresh water, as also the herring, shad and alewife.—*Richmond Whig.*

IS FISH CULTURE PROFITABLE?

We will say that you have a spring of water on your farm, or a brook from which you can draw into your ponds the water that will run through an inch pipe; you have constructed your ponds thirty feet long by ten feet wide, capable of holding two and one half feet of water, and have determined to experiment a little as an amateur pisciculturist. These ponds suitably divided into compartments are amply sufficient to hold four thousand trout. You have purchased each year for four years 1000 spawn at the average price of $8 per thousand, and have hatched and reared them successfully. In addition to the bits from your table, curds, sour milk, and a large occasional supply of food for them from the animals you have killed, you have purchased $25 worth of refuse meat. This is a large estimate, but let us make this side of the account as large as it will possibly bear. The labor and time you have expended in taking care of your trout, and in fitting up your ponds has been trifling, and you have been amply repaid for all this in the pleasure you have experienced in seeing them thrive under your treatment. Your total cash outlay for the four years has been fifty seven dollars. Now what ought you to have in your ponds to offset this? You will have 1,000 three years olds, weighing at least one and a half pounds each; 1,000 two years olds weighing at least three quarters of a pound each; you have 2,250 pounds of trout, which at present prices is worth in the market and will sell for six hundred and seventy five dollars. In the summer time it is worth as much as fresh salmon, and that is worth from 40 to 50 cents per pound. Reckoning it at 40 cents, it is worth $900. Then you have in addition to this 1,000 yearlings, which are worth at least $80, and 1,000 small fry which are worth twenty dollars more.

Calling your trout worth only 20 cents per pound your fifty seven dollars has proved an investment which has brought you property worth five hundred and thirty dollars. Supposing from some cause or other one half of your fishes die, or are stolen by somebody's neighbor's boys, or that they do not grow to more than one half the size you expected they would: Even then your $57 has yielded you a return of more than 400 per cent. So looking at the matter from which ever way you will you must, I think, see that the statement which some one has made, that fish culture pays a profit of 1,000 per cent., or that fish can be raised and sold in our markets at two cents per pound, are not altogether wild and fanciful statements. The net profits of trout propagation at the establishment of Mr. Green, in Livingston county, New York, were $1,000 in 1866, $5,000 in 1867, and $1,000 in 1868. The property where his ponds are located was purchased a few years ago for two thousand dollars, and when his operations had fairly commenced he accepted a proposition for six thousand dollars for a half interest in the works. Stephen C. Ainsworth, the pioneer pisciculturist of this country says, with a good spring of one half inch of water, one may raise all the trout he needs for his table with trifling expense. Dr. J. N. Slack, of New Jersey, regards pisciculture as no longer an experiment, but as a pursuit quite as certain as agriculture, and at present much more profitable.—*From an address before the Vermont Fish Culturists Convention.*

Natural History.

[This Department is under the charge of a competent Naturalist, endorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

—The letter from Mr. J. Allen in an adjoining column calls for particular attention. We are all too much inclined to looseness in our nomenclature, and it is much more easy, in general, to speak properly, if we only know how. In this case Mr. Allen is good enough to tell us, and no one is better qualified than he.

—A large number of snakes, monkeys, sun-bears and other animals arrived in a ship from Borneo this week, and were distributed to owner's menageries.

—The large number of living animals which the Prince of Wales brought home from India with him have been housed at the Zoological Gardens in London, and are exciting the attention of all British naturalists. It is an extraordinary collection.

BIRDS OF CENTRAL NEW YORK.

(*Continued from Page* 283.)

Pyranga rubra. Scarlet tanager. A common summer resident; breeds. Arrives the second week in May and departs in September.

Hirundo horreorum. Barn swallow. An abundant summer resident, arriving the first week in May and departing in September.

Petrochelidon lunifrons. Eave swallow. Abundant, coming with the barn swallow, but leaving in August.

Cotyle riparia. Bank swallow or sand martin. Abundant from the second week in May until the latter part of August.

Progne purpurea. Purple martin. Abundant from the first week in May until late in August. Nests in garden boxes.

Ampelis cedrorum. Cherry-bird, cedar-bird. Resident throughout the year, but not very plenty in winter. It breeds in June, nesting in apple trees.

Vireo gilvus. Warbling vireo. A summer resident, breeding. It arrives the second week in May.

Vireo noveboracensis. White-eyed vireo. A summer resident, but not very plenty. It breeds.

Collyrio borealis. Great northern shrike or butcher-bird. Resident and breeds. Frank Wright, of Auburn, N. Y., found three nests in one hedge-row last summer.

H. G. FOWLER.

THE FAUNA OF NEBRASKA.

GILMORE, Sarpy county.

EDITOR FOREST AND STREAM:—

Undoubtedly Nebraska is one of the finest States in the Union for hunting purposes. A sportsman can have his choice as to what kind of game to hunt, from a Wilson snipe to a bison or a mountain lion. The Union Pacific Railroad runs through the heart of the hunting grounds, which makes it very convenient for parties who wish to enjoy a glorious hunt. Every accommodation may be obtained at reasonable rates. Parties from abroad wishing to take a hunt can obtain all of the necessary information on their arrival at Omaha. The following are the different kinds of game that may be hunted successfully in their season:—

Geese.—The Canada-goose, wild goose, *Anser canadensis*, Hutchins' goose, *Anser Hutchinsii*; white-fronted goose, speckled brant, *Anser albifrons*; brant goose, gray brant, *Anser bernicla*; snow goose, white brant, *Anser hyperboreus.*

Swans.—The trumpeter, *Cycnus buccinator*; American, *Cycnus americanus.*

Ducks.—The canvas-back duck, *Fuligula vallisneria*; mallard duck, green head, *Anas boschas*; red-headed duck, red-head, *Fuligula marina*; gadwall, *Anas streperia*; bottle-headed duck, *Fuligula albeola*; ruddy duck, *Fuligula rubida*; dusky duck, black duck, *Anas obscura*; widgeon, bald pate, *Anas americana*; wood duck, summer duck, *Anas sponsa*; pin-tail duck, *Anas acuta*; scaup duck, *Fuligula marila*; green-winged teal, *Anas carolinensis*; blue-winged teal, *Anas discors*; shoveller, *Anas clypeata.*

Merganseres.—The Red-breasted merganser, *Mergus serrator*; hooded merganser, *Mergus cucullatus.*

Quail.—The Common American quail, *Ortyx virginianus.*

Grouse.—The pinnated grouse, prairie chickee, *Tetrao cupido.* We also have a very few sharp-tailed grouse, *Tetrao phasianellus.* These, also the rock ptarmigan, *Tetrao rupestries*, are found in large numbers at the base of the Rocky Mountains. But as long as the pinnated grouse continue to be as plentiful as they are now they will afford much better sport than their western relatives.

Snipe.—Woodcock, *Scolopax minor*; Wilson snipe, jack snipe, English snipe, *Scolopax noveboracensis.* The two latter are very plentiful, and afford splendid sport. Woodcock are to be found among the willows on the banks of the Missouri River. I will not recommend it as pleasant shooting. The willows are very thick, and it is almost impossible to force a passage through them.

Plovers.—We have several varieties of this class, but principally the golden plover, frost bird, *Charadrius mahmoratus.*

Curlews.—The Esquimaux curlew, *Numenius borealis*; sickle-bill curlew, *Numenius longerostris*; Hudsonian curlew, *Numenius hudsonicus.* The Esquimaux curlew, like the golden plover, visits us in large numbers, and afford splendid shooting.

Sandpipers.—I will not give the names of the different kinds, but will simply say that we have an endless variety.

Turkeys.—We have a few of these king birds, but it being winter shooting, the sportsmen hardly ever attempt to hunt them. Also the hare—we have three kinds—are not molested to any great extent. We have two kinds of rails, the sora and Virginia, and sometimes we bag a clapper, but not often.

Quadrupeds.—The bison, buffalo, *Bos americanus*; elk, *Cervus canadensis*; black-tailed deer, *Cervus macrotis*; common deer, *Cervus virginianus*, and the antelope.

Piscatorial.—Nebraska is not a very good place for fishing, but there is splendid trout fishing farther west, on the line of the Union Pacific Railroad.

C. H. PHILLIPS, Agt. U. P. R. R.

"HARE" AND "RABBIT."

CAMBRIDGE, Mass., June 1st, 1876.

EDITOR FOREST AND STREAM:—

In your issue of May 25th the question of what is a rabbit as distinguished from a hare is once more raised. The answer is short and simple. Hare is a general term applicable to every species of the *Leporidæ* or hare family, while rabbit is a specific appellation, strictly applicable only to the single species *Lepus cuniculus* of the old world, which is the well-known original of our domestic stock of rabbits. In other words, the term *hare* is comparable with the term *thrush*, and *rabbit* to the term *robin* (the latter as used in this country), the one being applicable to any species of the *Turtidæ*, or thrush family, while the other is the name of the single species *Turdus migratorius.* Or, again: *Hare* has the same general applicability as squirrel, while *rabbit* has the same restricted limitation as chickaree (*Sciurus hudsonius*) or chipmunk (*Tamias striatus*), names distinctive of particular species of squirrel. It hence follows that we have no indigenous species of hare to which the name rabbit is strictly applicable.

Waterhouse, in his great work on the Rodentia, used the term hare with some appropriate distinctive prefix for every species of the hare family, except the *Lepus cuniculus*, for which he alone used the name rabbit, and most European authors have recognized the same distinction. The correlative of hare is found in other languages, as the *Aas* of the Dutch, the *Aase* of the Germans, *hara* of the Danes and Swedes, etc., which terms are used also in a general sense, and applied with proper distinctive expletives to all the species of the hare family, except to *Lepus cuniculus*, which species, as in English, has its distinctive appellation in other languages. It is thus the Caninchen of the Germans, the Robbekon of the Dutch, the Kaninlig of the Danes and Swedes, the Conejo of the Spaniards, the Coniglio of the Italians, the Coelho of the Portuguese, etc. The early English name of the rabbit was Cony, which, with most of the names given above, is traced by entymologists to the Latin specific name of this species, namely, *Cuniculus.* The term rabbit is in like manner traced to the Dutch word Robbekon.

By most American writers the names rabbit and hare have been used interchangeably, the same writer, often using both terms on different occasions for the same species, while few, if any, have ever followed any fixed rule in the use of these names. For many years the early English explorers and settlers of America very commonly applied the term cony to our common little wood hare (*Lepus sylvaticus*), which was gradually supplanted by the name rabbit. The custom of applying the term rabbit indifferently to some or all of our American hares is so fixed that it will probably never be wholly eradicated from our vernacular, and its restriction to one or more species rather than to others will be purely a matter of conventional agreement. The true rabbit (*Lepus cuniculus*) differs not only greatly in habit from any of the other hares, but so much in structural features that several of the highest recent authorities agree in placing it by itself in a distinct genus, for which the general term *Cuniculus* was adopted by Dr. J. E. Gray. This name, however, proves to be preoccupied for another genus of mammals, in view of which fact Lilljehorg has proposed for it the generic term *Orycotalagus.*

J. A. ALLEN.

SAGACITY OF A SEAL.

PORTLAND, Me., May 12th, 1876.

EDITOR FOREST AND STREAM:—

Some weeks ago I was witness to a remarkable display of sagacity and ingenuity in one of our common seals. I was shooting upon one of two small islands "broad off at sea," when my companion called my attention to a seal in the channel between the two islands. Upon looking I saw a common seal with an old squaw (*Harelda glacialis*) in its mouth. The duck was alive and lively, but whether or not it had been a cripple previous to its capture I could not tell. The seal held the duck by the wing when first seen, and kept playing with it much as a cat plays with a mouse. When he would let it go the duck would immediately dive, but invariably come up again in the seal's mouth. Finally this rough play killed the duck. Meanwhile several herring gulls, whose curiosity had been excited by this performance, began circling around the seal and alighting in the water near him. Then began the fun for us. The seal would "tread water," shaking the duck about in his mouth until the gulls were darting close to his head, or alighting on the water close to him; then Mr. Seal would sink quietly out of sight, sometimes leaving the duck on the surface of the water, and again taking it with him. In a moment you would see one of the gulls spring hastily into the air as the seal's head broke the surface where said gull had been sitting. All

this play took place within a few hundred yards of myself and friend, and we were watching it with opera glasses, so that we had a perfect view of the performance. I think the seal's efforts at thus deceiving the gulls lasted about two hours; and although we did not see him succeed in capturing his game, we did see him catch one old gull by its tail feathers, but they pulled out and the gull escaped. The whole scene was intensely interesting to me. At first it looked like play, but before it progressed far it was evident that it was not that alone, and the skillful way in which the seal managed his "trailer" was deserving of better success. I have often heard our shore gunners assert that seals would take down wounded and dead ducks, but had always felt disposed to take their statements *cum grano salis*, although I have often seen seals swim up and gaze curiously at both my dead and wounded ducks. The seal ranks high in the brute creation, but this exhibition places him further up in the social order than I have been in the habit of considering him. Have any of your readers seen a similar exhibition of this propensity for decoying, or was this instance a sporadic or accidental case of taking on the attributes (and wiles) of human kind? MAC.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—One mocking-bird, *Mimus polyglottus;* presented by Mrs. L. Gutstwhite, Philadelphia. One lamprey eel, *Petromyzon marinus;* presented by H. R. Allen, Bridesburg, Pa. One garter snake, *Eutainia sirtalis;* presented by R. H. Lee, Jr., Philadelphia. One banded rattlesnake, *Crotalus durissus;* Presented by Wm. Bowron, Philadelphia. One long-tailed deer, *Cervus leucurus;* presented by Hugh McIlvaine, Philadelphia. One garter snake, *Eutainia sirtalis;* two speckled tortoises, *Emys guttata;* one mud tortoise, *Kinosternon pennsylvanicum;* one musk tortoise, *Sternotherus odoratus;* one salt water terrapin, *Emys terrapin;* presented by Joseph M. Wilson, Washington, D. C. One Fournier's capromys, *Capromys pilorides;* presented. Two spider monkeys, *Ateles;* purchased. One opposum *Didelphys virginiana;* presented by E. T. Fenton, Philadelphia. One adjutant, *Zeploplilos argala;* purchased. One salt water terrapin, *Emys terrapin,* presented. One woodchuck, *Arctomys m nax,* presented by S. P. Platt, Norristown, Pa. One horned toad, *Phrynorosoma cornuta,* presented by J. Kaufman, Philadelphia. One pine snake, *Pituophis melanoleucus,* presented by Geo. Cranmer, West Creek, N. J. One bald eagle, *Haliœtus leucocephalus,* presented. Thirteen horned toad, *Phrynosoma cornuta,* presented by F. R. Brown, Philadelphia. Two great horned owls, *Bubo virginianus,* presented by Thos. Bertler, Dochun, Pa. One great horned owl, *B. virginianus;* two screech owls, *Scops asio,* presented. Two crow-blackbirds, *Quiscalus purpureus,* presented. One Fronnut's black snake, *Bascanion Fremonii,* presented. Two black snakes, *B. constrictor,* presented by Master H. L. Verts, Philadelphia. One Patas monkey, *cercorithecus rubev;* one green monkey, *C. callitrichus;* one squirrel monkey, *Saimaris sciurea;* two weeper capuchins, *Cebus capucinus;* two brown capuchins, *C. fatuellus;* one guinea baboon, *Cynocephalus sphinx;* one spotted cavy, *Cœlogmys paca;* one ocelot, *Felis pardalis;* three coatis, *Nasua nasica;* two collared peccaries, *Dicotyles tajacu,* purchased.

ARTHUR E. BROWN, General Superintendent.

RECENT ARRIVALS AT THE CENTENNIAL AQUARIA.—Five thousand gallons sea water, by J. J. Gardner, Mayor Atlantic City, N. J. Two foregerhead turtles, *Chelone caouana;* fifteen green turtles, *C. midas;* Six spotted tortoises, *Emys guttata;* seventy-nine salt water terrapin, *E. palustris;* one snapping turtle, *Chelonura serpentina;* one king crab, *Limulus polyphemus.* By Eugene G. Blackford, Fulton Market, New York. Three paddle fish, *Polyodon spatula;* two blue cats, *Pamelodus caruleseus;* two lake sheephead, *Haplodonotus grunniens;* by Thomas W. Joy, Diamond Market, Pittsburgh, Pa. One spotted ray, *Raia ocellata;* one spider crab, *Libinia canaliculata;* one toad fish, *Batrachus tau;* mussels, shells, etc. By Camden & Atlantic Railroad.

FRED MATHER, Superintendent.

Sea and River Fishing.

FISH IN SEASON IN JUNE.

Trout, *Salmo fontinalis.*
Salmon, *Salmo salar.*
Salmon Trout, *Salmo confinis.*
Black Bass, *Micropterus nigricane.*
Shad. *Alosa.*
Land-locked Salmon, *Salmo Gloveri.*
Grayling, *Thymallus tricolor.*

FLIES IN SEASON FOR JUNE.

Hawthorn, No. 11—Body, shining black; feet and head, black; wings, bright hyaline.

Shoemaker, No. 10.—Body, ringed alternately with light-gray and salmon; feet, dark ginger; wings, the mottled gray of the mallard, and the mottled of the woodcock mixed; setæ, mottled woodcock.

Black June, No. 10.—Body, peacock's herl; feet and wings, black.

Dark Stone, No. 8 *and* 9.—Body, dark brown; feet, yellow brown; wings, luteous.

Governor, No. 10.—Body, peacock,s herl; feet, dark red hackle; wings, made of the darkest part of the bittern's wing, or brown hen.

Green Drake, No. 7.—Body, white posterior, half ribbed with black, green-yellow, mottled with brown; setæ, dark brown.

Brown Drake, No. 7.—Body, feet, and wings, a golden yellow brown; setæ, dark brown.

Raven, No. 11.—Body, feet, and wings, black.

Wren Fly, No. 9.—Body, clay-yellow; feet, made from the scapulary feathers of the English wren or quail; wings and setæ, mottled widgeon.

FISH IN MARKET.—Fish are very abundant, and prices low. We quote:—Striped bass, 20c. per pound; bluefish, 12c.; salmon, Kennebec, 45c., California, 25c.; mackerel, 8c. to 15c. each; shad, 50c.; weakfish, 10c. per pound; white perch, 15c.; Spanish mackerel from Norfolk, 30c.; green turtle, 15c.; terrapin, $12 per dozen; halibut, 15c. per pound; haddock, 8c.; kingfish, 20c.; codfish, 8c.; blackfish, 12c.; flounders, 10c.; porgies, 8c.; sea bass, 15c.; eels, 18c.; lobsters, 8c., sheepshead, 15c.; scollops, $1 per gallon; soft clams, 40c. to 60c. per 100; brook trout, $1 per pound; hard shell crabs, $3 per 100; soft do.; 50c. to $1 per dozen; red snappers, 15c. per pound.

SALT WATER.—Weakfish are being taken in numbers in the Great South Bay, just inside of Fire Island Inlet. The bait used is a No. 2 squid, kept just off the bottom. The fish run about six pounds in weight, and very uniform in size. Bluefish are also being taken just inside the bar, with the squid. The fish, however, are small. Chumming has not yet commenced, as the fish are not fairly in the bay.

—We learn that the ice left Rangely Lake, Maine, on the 27th of May last, and that a day or two after a six and a half pound speckled trout was caught in the stream in front of the Oquossoc club house. Also, a two pound land locked salmon was caught about the same time from Rangely stream, the first stranger of any size that has been caught from the recent importations into those waters.

—DR. J. P. [Ordway, President of the Massachusetts Anglers' Association, left Boston last week for a month's sojourn in Maine, to the Androscoggin waters, where he will cast his fly.

—Gaspereaux are quite plentiful on the north shore of New Brunswick this season.

—Accounts from Chatham, N. B., indicate that salmon will be plentiful in the Miramichi this season. Two boxes were shipped from Miramichi Station on Monday 29th May, for Boston. Our correspondent says they were the first of the season. Eleven-pound fish were selling for $1.25 on Chatham street on the Saturday before, and at present date sell for $1.

NEW YORK—*The Adirondacks, May 30th.*—Season behind hand. Trolling for lake trout with fly, spoon, etc., has not been as good as formerly, owing to the cold weather and excessive high water, although in the Upper Saranac trout have been taken, weighing from 6 to 16 pounds. I find registered at Martin's Messrs. Tileston and Mudge, of Boston, S. Arnold, Keeseville, N. Y., E. B. and H. Smith, Buffalo; at Bartlett's, Dr. W. W. Ely, Rochester, C. K. Jenkins, Salem, Mass., Dr. J. R. Ronyu, Keeseville, Col. T. J. Hoyt, New York. Very few sportsmen in the woods yet, but a few days will undoubtedly find the number increased. O. P. Q.

NEW JERSEY.—*Kinsley's Ashley House, Barnegat Inlet, June 1st*—The following is the score of catches of bluefish as far as your correspondent could learn this week: 27th—W. H. Lippencott, Philadelphia, 32; Rev. John Street, Beverly, 165. 28th and 29th—Wm. Southard, N. Y., 141; E. F. Byrne, N Y., 40; J. H. Cost, N. Y., 40; Capt. Jessie Birdsdall, 40; Capt. L. Malcrom and party, 78. Some seven or eight other parties from New York and Philadelphia were out during the week and averaged 60 per boat. J. M. Atwater and H. E. Atwater took 65 bluefish averaging three pounds in less than two hours. The fish are small, about three pounds. Only one school has entered the inlet. At time of writing the gulls are seen outside the beach in large numbers, which indicates the presence of fish, and as some of our coasters passed large schools of bluefish, eight to ten-pounders, off Cape May on the 28th inst., are preparing for them on next flood tide. Black fish and sea bass are plenty and running large size. B.

PENNSYLVANIA—*Harrisburg, June 5th.*—No shad caught here yet. Up the Juniata, at Newport, forty miles above Honesburg, Susquehanna shad have been caught in small numbers. The black bass anglers are waiting impatiently for the opening of this sport. Bass are plenty, and some of them very fine. AUDUBON.

Philadelphia, June 5th.—After many days the anglers have a chance to try to catch the black bass in the Schuylkill. From the great number I see jumping, and the small number caught the stock is not likely to be soon exhausted. Two rods took nine on Decoration Day, which is no recommendation to law abiding anglers. Two other rods got nine on Thursday. That seems so far to be about the average catch. SCULLS.

CANADA—*Chatham, N. B., June 2d.*—I had a party made up for a raid on the sea trout on the Queen's birthday, but it rained on the 23d, and that, added to the snow water made by the very warm Sunday previous, caused a heavy freshet. Fishing is out of the question until the river lowers about five feet. A few trout have been taken, but I do not expect there will be good fishing until, say 5th June. In three weeks from that time there will be rare sport. D. G. S.

NEWFOUNDLAND—*Harbor Grace, May 18th.*—The ice still fills our harbor and bay, but by all accounts the coast is pretty clear. It is probable that I shall visit Green Bay in July, and I will gather all the information I can about birds, animals, fish, &c., for FOREST AND STREAM. We have large trout in many of our ponds, some of them weighing three pounds; also, our sea trout are very large, some as large as small codfish. They make a strong but hearty meal. C.

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals reported at this port the past week has been 62, 12 from the Banks, 44 from Georges, 4 from mackereling trips South, and 2 from shore fishing trips. The receipts of Georges and Bank cod-fish are light for the season, the latter being taken promptly for export, and the stock of Georges remaining small. The mackerel fleet have commenced to arrive, with small fares, the receipts to date being about 500 bbls., which found ready sale at $4.75 and $6.75 per bbl., as to quality, unpacked. Fresh halibut has been in good receipt, and prices rule low.—*Cape Ann Advertiser, May 27th.*

ANGLING FOR SHAD.—Mr. John P. Motley, of Warren county, New Jersey, gives the *State Gazette* some facts relative to angling for shad that will be new to most of our readers. The theatre of his experiments was the Delaware River. But Mr. Motley did not catch the shad with flies, but with bait, with which he had remarkable success. He says this success was owing to his adapting the bait to the habits of the fish, the young shad, from the time they are hatched until they pass down into the bays or ocean, where they remain until old enough to return for spawning, feeding on small insects occasionally, when these insects fly near, and almost touch the surface of the water. We often see them leaping above the surface when the weather is favorable, and catching gnats that are within their short reach. But when they get to deep water, where they remain until next season, their food is infusoria—animalcules that constitute the greater part of the slimy growths that cover almost all submerged substances. Mr. Motley goes on to say:—

"The shad has a small, tender, delicately formed mouth, and a very flexible tongue, fit to receive and appropriate such matters as are suitable, and to reject others that are not of a kind to enter into the stomach. The selected matter is highly nitrogenous, and always present in the water. It makes the shad independent of the accidents that must at times cause a scarcity of food with fish that prey upon a frequently scarce and more uncertain kind of food. [This thought commands attention.—ED.]

"The shad is not intended to leap from the water, or rush after any bait, when he has attained a size beyond feeding on gnats that are flitting over the shallow margins he has to travel in going down the river to the sea. This much I write to account for my failure altogether with flies. I prepared a bait adapted, as I thought, to what the fish required. I still had doubt whether the shad would take it, as he was on his way up the river, not to eat, but for the purpose of propagation. He had started from his ocean home fat and vigorous, with accumulated force enough to carry him through, with the little addition he might perhaps receive from the fresh water infusoria that he might imbibe by the way. This idea was strengthened by the fact that shad are latter caught below Philadelphia than farther up the river. They are not as firm in fibre and delicately tasted as at Trenton or Easton. Exercise in fresh water absorbs fat, hardens the muscle, and heightens the flavor. I prepared a glutinous mass of Irish moss (*Chondrus crispus*), gluten from wheat flower, oyster juice, fibrine from bullocks' blood, and powdered sulphate of barytes. The last article being tasteless, insoluble, and heavy, was added to give weight to the compound. All these articles were well mixed and ground together, sufficient oyster juice being added to soften and discolor the Irish moss. I rolled the mass into sticks, like maccaroni, dried with a gentle heat, and ground up into fragments as coarse as Dupont's ducking powder. My hooks—No. 6 Kirby's—were whipped on brownish-green linen snoods of ten inches length; the snoods were fastened at intervals of a foot on a line of the same color. The three hooks attached to the line were covered thickly nearly to their points with the preparation in its moist state, and then dried until the coating became hard, so that in dissolving slowly it might adhere for a long time. Thus prepared, I tried my first experiment in deep water below the first island down stream, from the mouth of the Pohatcong, near the Belvidere Railroad. The night previously, as a lure, I had sifted a pint or more of the powdered preparation into the water at the head of the eddy, and anchored a coarse strainer, cloth bag, containing about the same quantity at the same place. Owing to the barytes, the powder thrown into the water sank down and remained on the bottom to dissolve slowly. In the morning I drifted gently down the river, and anchored my boat noiselessly about twenty yards above the pool. With a small gourd for a float, giving five feet for the depth of the lowest hook, I paid out line until the float was about four yards below the cloth bag. I had not long to wait. The float began to bob, and was soon under water. I tightened the line, and found a fish of peculiar action was hooked. His whole effort was to sound, to run to the bottom, from which the slightest pull would bring him back. I thought it must be a very shy fish, with a tender mouth, and a small canal in proportion to his size, for he seemed to have but little propelling force. After some careful handling I was enabled to bring the fish up to the side of the boat and land it with a net. To my great satisfaction, it proved to be a four pound shad, a melter, as fine a fish as one need wish to see. That morning, in less than an hour, I caught six others in the same way—two melters and four roe shad; two of the last weighed five and a half pounds each. During this hour's fishing the preparation had hardly all dissolved from the hooks. I have been out twice since in the early morning and have had equal success."

NEW HAVEN, Ct., May 26, 1876.

EDITOR FOREST AND STREAM:—

In FOREST AND STREAM of last week, E. S. F., inquires in regard to the above subject. Possibly a few remarks other than those which you gave him may be of some interest. Shad commence to take the fly as soon as the water begins to grow warm and continue to take it, I think, as long as they remain in the river, having myself caught them after the 1st of July. A most excellent cast of this is composed of the following: White miller for leader, with red ibis, snipe, and any drab fly with lighter body, arranged as you please. All of these flies must be quite small, as the shad bites rather delicately, so that a large fly is not taken sufficiently far into the mouth and the hook fails to penetrate the hard bony substance which it meets there. Fish from a boat anchored in a current about fifty or seventy five feet above a deep eddy, as the flies float down stream the current keeps them on top, and after they have reached the eddy the pole should be swayed gently back and forth to keep them in motion. Imagine a little incident in such a position. As your flies float slowly over a deep eddy, with flakes of foam and little whirlpools wheeling, and everywhere dotting the surface, suddenly a low splash is heard, and the next moment a vigorous tug, tug, bends your pole gracefully, and you have "hooked a fish." (and yet are the rightful owner of it); a quick rush up-stream, and the next moment with a sudden leap, his broad silvery sides glisten magnificently as the spray flies on either side. What music of the reel as he swiftly retraces his course! And soon another leap; and another. And now he struggles less and less until at last he draws near the boat, with mouth wide open and fins set, lying on one side. Had a six pounder, surely. The landing net is reached towards him eagerly. Your pole bends in a circle as with a last effort he darts under the boat and catching the leader, or the anchor line, breaks loose and floats slowly by, *just a little* to deep, to reach with the net; his body bending slowly with a quivering motion, showing him to be almost dead. Then may I remark: What music with the tinghet!

The best time to fish for shad is early in the morning, and from five until eight o'clock in the evening. As soon as it commences to grow dark they may be taken in still, and shallower water by casting, in the same manner as for trout or bass, and may be taken in this manner until long after dark. Only the very lightest trout tackle should be used for shad, as the fish will almost always break loose if the rod be strong enough to allow him any purchase whatever. Purchase, however, is sometimes desirable if you have had poor luck and must a fellow with shad to sell. ROBERT S. MORRIS.

KEEL VS. CENTRE BOARD YACHTS.—A correspondent writes from Boston as follows:—

"There are two yachts here—one keel and one centre-board—that have had several trials of speed together. In strong winds the keel boat has proved herself the ablest and fastest, and she is a little the smallest. The keel boat also draws five feet of water, the centre-board boat draws three feet; they are both ten feet beam, and pretty high sided. In smooth water the centre-board will go to windward of the keel and sail a little faster, yet when the sheets are started the keel boat shows her speed to be fastest, although she labors at a disadvantage drawing so much water. Why is it?

[With two boats equally well modeled, the keel boat would probably prove the ablest in heavy weather, her greater depth giving her a better hold on the water. In smooth water, which generally means light winds, the centre-board would have the advantage, and with sheets started should beat the keel boat. In this instance, probably, the latter has the advantage in model.—ED.]

The Kennel.

DOCKING DOG'S TAILS.

THERE is a great diversity of opinion among sportsmen and breeders of setters and pointers in regard to the docking of their dogs' tails. Some of our shooting acquaintances consider it altogether wrong to alter a dog's tail in any respect, and in England, dogs are excluded from bench shows if their tails have been cut or altered in any way.

There is nothing, in our opinion, that detracts so much from the beauty of a setter or pointer as a very long crooked tail. If we could not have a *good* dog without such a deformity we would, of course, endure it. But there is a remedy for it, and consequently we resort to it when we can, and by docking improve the appearance of the dog. What is it that gives such dogs a more currish appearance than a very long tail turned up over the stern, or, as is sometimes the case, turned to one side or the other? In our opinion a dog with such an appendage would look about as well, if he had *no* tail.

If all breeders would give this matter proper attention, we would soon have a strain of dogs with straight tails of the proper proportion, and consequently not need to dock. But unfortunately very little attention has been given to this important matter, particularly among the most noted English breeders. We have seen some specimens of setters imported from England which were handsome, high bred looking animals, in every respect except their tails, which were entirely out of proportion in length, or were carried turned up over the stern. Such tails could be, in our opinion, materially improved by docking. And then in regard to pointers, not only their appearance may be improved, but their future comfort, and even usefulness advanced by skillful docking. We have frequently met with pointers, having very long tails, with the skin completely whipped off the end for two or three inches. To work a dog thus is not only cruelty, but the dog, being in constant pain, does not work as well as he would with a good sound tail of proper length. Therefore, it is better to take off a small piece of the tail of most *pointer* pups, unless the tail has the appearance of being short enough. And the operation should be done when the pup is quite young, say three or four weeks old; as, when cut at about that age, it will not show a docked tail when he grows to doghood.

We very rarely dock a setter's tail until he becomes full grown, and then we can see exactly how much should be taken off to improve the appearance of the dog. And then, too, if the operation is skillfully performed, the tail gives very little the appearance of having been docked.

If a pointer's tail is docked after he has grown up, it shows the alteration so plainly that he is not much, if any, improved by it.

The beauty of many setters and pointers are marred by unskillful docking. Hence, it should never be done by any but those who have had experience in such matters.

—We have just had an opportunity of viewing the Field Trial setter bitch Rose, recently imported by J. E. Doxey, Esq., of this city, for J. B. Farnsworth, Esq., of Paris, Ontario. Rose is from the kennel of Thomas Pilkington, Esq., of Prescott, Lancanshire, England. She is a strong made, black and white ticked bitch, apparently about two and a half years old, and showing some excellent points of high breeding.

ANOTHER REMEDY FOR MANGE.

A Savannah correspondent—"Martello"—sends the following receipt for mange, which he says he has used with great success:—

First wash the dog well with common pine gum soap and tepid water, using a brush to clean his skin well; that night if perfectly dry, give him 20 grains calomel. The next morning give half pound of lard to the dog to eat, which will purge him, and kill all the bad effects which the calomel might have had otherwise. After one week's time you will find the disease all thrown out on the surface; then clean the dog up in some dry place where he will have a board floor to lie upon, for he must be kept away from the sand, as that hinders the cure. Then use the following compound to annoint with; three applications will be sufficient: one half pound of lard, boiled in water to remove the salt; three ounces of best mutton suet; four tablespoonsful of turpentine; one gill best train oil. Melt these together over a slow fire; then remove and add enough sulphur to make a paste thin enough to be well rubbed in with the hands, and in three weeks' time you will find your dog with a new coat of hair coming out, and a perfect cure effected.

DISTEMPER CURED.

SAN FRANCISCO, May 27th, 1876.

EDITOR FOREST AND STREAM:—

If it had not been for your valuable paper, and D. W. S. Webb's letter of March the 16th, another valuable setter would have passed to his happy hunting grounds. My setter, Bounce, now eighteen months old, was taken about ten days ago with that almost fatal "distemper," and in three days he was a mere skeleton, refusing food of all kinds, noticing nothing, and not able to stand. He had a kind of rattling in his throat and congued severely, with fits and nose running badly. It was as bad a case as I ever saw, and [illegible] give him up, when I thought of Dr. Webb's letter, and, looking [illegible] paper, I made up my mind to give it a trial, which, to my surprise [illegible] delight, has saved my dog. I first gave in the morning 1grs. blue mass, and at night 4grs. quinine; on the following morning 4grs. blue mass, also 4grs. quinine; at noon same day, 4grs. quinine; at night 4grs. quinine, and repeated it three times a day for three days, giving 4grs. a dose, and the result is, my dog is almost well, eats heartily, tries to play and seems as lively as he could under the circumstances. Any how I consider him saved, and my thanks to the FOREST AND STREAM, and Dr. W. S. Webb.

C. A. DOUD.

WARTS IN A DOG'S MOUTH.

JACKSON, Mich., May 30th, 1876.

EDITOR FOREST AND STREAM:—

In your paper of the 18th I noticed an article in regard to warts in a dog's mouth, if your correspondent means those large spongy excrescences (which resemble a small sponge more than anything I know of), perhaps I can suggest a remedy, it is very simple and inexpensive, but it has proven as effectual as it is simple for me. Take an onion (a red one), as I think they are the strongest; cut, and apply the fresh cut part to the wart or warts, and in a few days, by applying four or five times a day they will disappear; at least they did when I tried it. I found it a good remedy, and as it costs nothing to try it there need be no loss. I have handled dogs for a good many years, and have never seen but two cases of warts in a dogs mouth. I do not think it is a very common disease, if disease it may be called. JAMES HENNESSEY.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

ATLANTIC YACHT CLUB.—The regatta of this club on the 6th instant was one of the most successful aquatic events known—the wind fair and steady throughout the whole course, though freshening toward the last, testing the weatherly facilities of all classes, and the relative merits of the competitors in the race. Only one mishap occurred during the run, the sloop Orion losing her topmast; but this very accident possibly worked to her advantage in the end, for while it told on her speed, at the first, it helped her when the breeze freshened, and she came in gallantly one of the five leaders at the home stakeboat. The press was well taken care of on the Judge's boat, while the guests' excursion was eminent for its quality and propriety, the hundreds of ladies and gentlemen upon the "Magenta' being principally relatives of the club members, and showing a fair sprinkling of clergymen, and army and navy officers, with a representative or two from the British Navy. Dancing was indulged in, to the excellent music of Coterno's band, lunches were spread from family lunch-baskets *sans ceremonie*, and altogether the affair was quite domestic in its character and belongings. The entries were as follows:—

SCHOONERS.—Peerless, J. R. Maxwell; Triton, G. A. Thayer; Agnes, L. A. Fish.

FIRST-CLASS SLOOPS.—Undine, Brasher & Fowler; Orion, Wm. Cooper; Sadie, W. E. Greenleaf; Madcap, J. R. Busk.

THIRD CLASS SLOOPS.—Kaiser Wilhelm, W. H. Field; Nimbus, L. H. Bigelow; Curlew, Governor Kortright.

A flying start was effected, the Triton crossing the line first, with the lead, at 10:57:30, a position she was destined to hold throughout the race. Running out before the wind, the schooners held their advantage, the Triton rounding the Lightship at 1:10:15. It was now a beat up for the Beacon, and topsails and jibtopsails were sent on deck. The judges' steamer steamed ahead of the fleet and awaited their arrival at the finish. The summary of the race is as follows:—

SCHOONERS.

Name.	Start. h. m. s.	Finish. h. m. s.	Elapsed time. h. m. s.	Corrected time. h. m. s.
Triton	10 57 30	4 48 30	5 50 00	5 46 28
Agnes	10 59 45	4 50 00	5 50 15	5 52 35
Peerless	11 00 00	5 02 20	6 02 20	6 02 20
FIRST-CLASS SLOOPS.				
Undine	11 03 47	4 52 10	5 48 23	5 48 23
Madcap	11 05 28	4 58 45	5 53 17	5 42 46
Orion	11 04 50	5 07 30	6 02 40	5 59 59
Sadie	11 06 05	5 13 30	2 07 25	6 02 14
SECOND-CLASS SLOOPS.				
Kaiser	11 06 30	4 07 27	5 00 57	5 00 57
Nimbus	11 07 00	4 14 37	5 07 37	4 58 13
Curlew	11 08 00	4 17 25	5 09 25	4 48 23

Thus the Triton wins the schooner prize, beating the Agnes 5m. and 7s.; the Madcap wins the first-class sloop prize, beating the Undine 5m. and 37s.; the Curlew wins the second-class sloop prize, beating the Nimbus 9m. and 50s., and the Undine wins the Livingston memorial prize as the first class sloop in.

PERTH AMBOY YACHT CLUB.—The corinthian regatta of this club was sailed on the 30th ulto., the course being the usual one in Raritan Bay. There were four entries in the first-class; in the second the Hitty McGinn had no competitor, and in the third there were two, the Ripple and Lula, the latter being the winner. The official time of the yachts in the first-class is given in the following official report of the judges.—

"We find the Cynthia to be the winner in the first-class. The time actual and corrected in the first-class was as follows:—

Yacht.	Start. h. m. s.	Arrival. h. m. s.	Actual. h. m. s.	Corrected. h. m. s.
Cynthia	11 37 15	2 6 30	2 28 15	2 29 15
Silvermann	11 35 50	2 11 25	2 25 35	2 29 20
Ada S	11 37 40	2 13 50	2 26 10	2 29 55
Ocean Spray	11 41 00	2 21 30	2 40 30	2 37 10

P. E. Thomas, Henry Farmer, and E. H. Hall, Regatta Committee.

SEAWANHAKA YACHT CLUB.—At a meeting of this club held last week, Messrs. Roosevelt Schuyler and Fred Thoms were appointed to represent the club on the Centennial Regatta Committee. The 24th July was named as the day for starting on the proposed Centennial cruise to Philadelphia, and July 4th as the date for starting on the regular annual cruise.

THE BROOKLYN YACHT CLUB.—At an adjourned meeting of the club held last week, the regatta committee announced everything in readiness for that event, which occurs on Saturday. The course will be the usual one, starting from Bay Ridge and rounding the S. W. Spit and Lightship. It has finally been decided to give the prize in the Greenpoint regatta to the Kate, the Sadie having launched a boat after passing the line. Messrs. G. F. Hines and J. F. Sawyer were appointed to act upon the Centennial Regatta Committee.

—The professional prizes at the Centennial International regatta will be for four-oared; first prize, $25,00; second prize, $1,000. For pairs, first prize, $1,000; second prize, $500. Single sculls, first prize, $800; second prize, $400. These amounts may, and probably will be increased.

—It is now settled that Dartmouth College will not send a crew to Saratoga, owing to the impossibility of raising funds to pay the expense.

—Messrs. F. D. Weeks and H. P. Brown rowed a race on the Harlem River on Saturday last, to decide who should be the champion of Columbia College in the Intercollegiate Regatta to be held at Saratoga on July 19th. The distance was two miles, and Weeks won in 14 minutes 20 seconds.

—The four-oared shell race, three miles straightaway, between the Juniors and Sophomores of Bowdoin College on the 2d inst, was won by the latter in 18 minutes 56¾ seconds.

—The Neptune Rowing Club, of Staten Island, hold their annual regatta on Saturday.

—The Columbia Boat Club, of Brooklyn, will hold their annual regatta on the same day, the steamer Thos. P. Way leaving foot of Montague street at 3:30 P. M.

MYSTIC BOAT CLUB.—The annual regatta of this club was held on the Passaic River on Saturday last. The first race, for single shells, brought out two entries, Messrs. J. W. Adams and D. E. Tuthill. The former won in 9 minutes 27 seconds, the distance a mile and a half with a turn. The second race was between four-oared barges, three miles with a turn, Mr. Adams' crew winning in 14 minutes 35 seconds. The most exciting event of the day was the four-oared race between the Athletic Club, of New York, and the Triton Club, of Newark, over the three mile course. The boats were manned as follows: Athletic, R. W. Rathbone, bow; S. Muck, No. 2; H. C. West, No. 3; C. K. Cone, stroke; color, red and white. Triton crew, S. A. Smith, bow; F. E. Townley, No. 2; A. E. Pomeroy, No. 3; Edward Phillips, stroke; color, crimson. At the end of a mile the Athletics passed the Tritons, and kept the lead to the finish, passing the judges' boat in 20 minutes 5 seconds. The Tritons, who were between five and six boat lengths in the rear, passed in 20 minutes 17 seconds.

The referee and starter was Commodore F. W. Harris, of the Passaic Rowing Association, and the judges were S. A. Smith and J. R. Dennis.

THE "QUI VIVE" AND "DELAWARE" CANOES, AND THEIR PROPOSED CRUISE.—*Editor Forest and Stream:*—On Thursday, May 11th at 10 o'clock A. M., the "Qui Vive" left the dock at Newark with captain and crew on board, and provisions for a cruise. The wind was blowing nearly a gale from the N. W., so the stormsail was set and close reefed by rolling it round the mast. She dashed along swiftly over the rough water of Newark Bay, and at noon entered the canal. At 1:30 P. M. her captain lunched her upon New York Bay, where the waves were running literally mast high. At 3 o'clock all hands boarded a coasting schooner to rest, eat and dry off. At 5 o'clock the "Qui Vive" got under weigh, and at 6:30 o'clock was safely lodged under cover at New York City, having been on the water over eight hours, part of the time in very high seas, but with less than a pint of water in her at the end.

But what is the "Qui Vive?" She is a canoe fourteen feet long, twenty six inches wide and one foot deep over all, from ridge of deck to bottom of one inch keel amidships. She is decked over at bow and stern, with a well amidships four feet long by twenty inches wide, surrounded by an inch coaming. Over the well is fitted a white rubber apron, which buttons tight around the paddles, and effectually keeps all spray and rain from getting below. Her means of propulsion are a double bladed paddle and sails. The sails are a standing lug main and a jib foresail. The mast is four feet six inches above deck, but the peak of mainsail when hoisted is over six feet. The sails are so arranged that they may be set or taken in without the canoeist leaving his seat. The painter is rove through a brass eye at bow and stern, and runs entirely around the canoe, being used as jib outhaul, and to keep the apron close to the deck in a sea. The "Qui Vive," complete with mast, sails, apron, seatback, paddle, stretcher, flag and flagstaff, weighs fifty pounds. The seatback is "Rob Roy" style, two strips of wood to rest along the back without touching the spine, and is hinged to the after coamings.

The "Qui Vive" and her sister "Delaware" were built by me this spring, for the purpose of a cruise to the Centennial this Summer. The latter was built for a well known Newark gentleman who is anticipating much pleasure and benefit from the trip. He expects to travel 300 miles, and to be at the Centennial about a week.

A word about the sleeping accommodations. With the paddle and a rubber sheet a water tight cabin can be rigged at night, and there is ample space below deck to allow the knees of the sleeper to pass, so that he may turn over, which is necessary for a comfortable sleep. The sailing qualities of these canoes are astonishing, they will heat to windward, and require very little steering. The paddle is straight bladed, seven feet six inches long, and weighs two and a half pounds, it is used in steering when under sail. MAGNA.

THE AMERICA.—The renowned yacht "America," preparatory to the contests anticipated during the coming yatching season, in which she is destined to take an active part, went into the Fort Hill Dry Dock at the foot of Oliver street, Boston, Thursday noon, May 25th, for the purpose of having the metal taken off her bottom and pure copper put on in its place, thereby presenting a smoother and better surface under the water line. The opportunity thus presented to yatchmen and others to inspect the model and lines of the America was embraced by many. Upon removing the metal her teak planking, put on in England, was found to be perfectly sound.

From the Dry Dock she was taken to Bay View, near

the Summer residences of her owners, Gen. Benj. F. Butler and Col. Jonas H. French, where she will be put in thorough condition and trim.

YACHTING AT BERMUDA.

HAMILTON, Bermuda, April 26th, 1876.

EDITOR FOREST AND STREAM.—

The Bermudian yachts have been long celebrated among sailing craft for their peculiar rig, their powers of going to windward, and general handiness. Will it be telling a twice-told tale if I attempt to describe them in your columns? They are short, beamy, powerful boats, in appearance not unlike some English fishing craft, bluff in the bows, and lean aft—of the cod's head and shoulders and mackerel tail build, in fact. Withal they are fine below water, having a sharp, wedge-shaped floor, a very deep false keel, a sloping stern, and slightly raking sternpost. They range generally from two to sixteen tons, or even larger, but anything above the latter size is, I believe, rare. The favorite size for racing appears to be six tons.

The great peculiarity of the Mudian is her rig. An enormous mast is stepped right forwards in the eyes of the boat, which rakes aft to such an extent that n line drawn straight downwards from the truck would fall somewhere about the after part of the cock-pit. On this mast is hoisted a large leg-of-mutton-shaped mainsail, and a foresail (or jib) is set by means of forestay and standing bowsprit, as in the American sloop; usually no other sail is carried, except when running, when a large spinnaker or squaresail is set. A boat rigged for racing has no shroud or stay of any description to her mast (except the forestay). Her boom, instead of working on the mast by means of jaws or goose-neck, is made fast to a mast traveler with a small tackle about three or four feet above the deck, and the sail is hoisted out by the boom by this means, smacking in the same way that a sail is set with a sprit and snotter. The appearance of a good Mudian boat, with her long tapering mast and beautifully sitting sails is very fine, though her hull is certainly opposed to all our received notions of the form of naval architecture best adapted for speed. Being built of cedar and faithfully put together, they last for ages, and a boat 20 years old is considered about in her prime. I give the dimensions of the "Julia," a new boat, launched last January, so that an idea may be formed of the style of craft: Length of keel, 10 feet (sixteen); length over all, 22 feet (twenty-two); depth of hold forward, 4 feet 2 inches (four, two); depth amidships, 4 feet 3 inches, (four, three); depth aft, (1 feet 4 inches, (four, four); width (outside gunwales) 8 feet 2 inches, (eight, two); draft aft, 6 feet 6 inches in racing trim, tonnage, 4 tons 6-10ths. Her owner, who gave me these dimensions, told me her racing mast was 48 feet in length! (from heel to truck). At this rate the imagination can hardly grasp the idea of the stick that would be required for a 100 ton racing sloop; were she rigged Bermudian fashion, it would be necessary to send to the Yosemite valley for all of its big trees.

I was fortunate enough during my short stay in the Islands to have a good opportunity of seeing a sailing race. On my arrival at Hamilton some two or three days previous to the match, there were evidences of some boating excitement going on. Boats were being fitted out with racing spars and sails, and onlght he seen cruising about the waters of the sound, trying their gear and preparing for the contest. The 25th of April was the day fixed for the race, and the weather and surroundings were charming, the clear, light blue sea, darkened here and there by coral reefs, and crisped by a fresh westerly breeze, the bright warm sky and green islands making a perfect picture for the mind to dwell on, after moving to colder regions farther north.

The course was laid in the waters of the sound—n nearly land-locked harbor inside the reefs, and marked by two stakeboats moored about four miles from each other in a direct line to windward and leeward. The competing yachts started from the leeward boat, beat up to the windward one, then ran back and beat up again, finishing at the windward boat, so that altogether the course was about twelve miles long, and chiefly designed to test the capacity of the boats for going to windward. Five boats were entered: Diadem, 2 66 tons, Lincoln, 2.84 tons; Julia, 4.60 tons; Nautilus, 5.58 tons, Unknown, 10.94 tons. Oon of the conditions of the race was shifting ballast to bo allowed! Fancy this, in the year of grace 1876. I believe, however, that this is not always the custom in the present Bermudian yacht racing.

Half-past eleven A. M. was the time fixed for the start, I believe, but at that hour not even the stakeboats were placed. About twelve they appeared, followed by the racing boats, and at onee all was ready. The time allowance was given at the start, and at eight minutes past the hlit a Diadem was sent off receiving a start of fifty-four seconds from the next boat, the Lincoln. The little boat tore through the water at a great rate, under the pressure of a spread of canvas, but the Lincoln, which was sent off at 1:9:54, was evidently bound to overhaul her soon, as she laid a point or so closer to the wind. 6 minutes 37 seconds after the Lincoln the new Julia was sent off, her sails sitting like a board, the boat standing well up under her canvas, and sailing very close to the wind. Then came the Nautilus, 2 minutes and 39 seconds after the Julia, and last the great Unknown was started 9 minutes and 25 seconds after the Nautilus and 18 minutes after the Lincoln, which boat was now leading well on her way to the turning boat, the Nautilus and Julia close up. The Diadem was soon out of the race, and before the windward stakeboat was reached the Julia had weathered on the Lincoln and got into first place. The Nautilus had also overtaken the latter boat, and was close behind the Julia, and evidently going faster through the water, while the Unknown was coming up hand over hand, sailing beautifully, the fresh breeze agreeing with her. The Julia, however, rounded the stakeboat first, at 23 minutes past 2. Then the Nautilus, not quite a minute, after followed by the Lincoln and Unknown in two and four minutes respectively. The Lincoln's chances of winning were now at an end, bar accidents, and she retired from the race shortly afterwards. Enormous square sails were now set for the run down, and very pretty the yachts looked as they sailed past under a spread of canvas, the Julia "wabbling" a good deal. The Unknown was evidently bound to win, as she had picked up much more than half her time in the bent up, and would gain still more in the run down before turning to windward again. The Nautilus soon overhauled the Julia, and the Unknown was close behind the latter at the leeward stakeboat, when the event of the day happened. The hands on board the Julia appeared to have been preparing to get in their squaresail, when a puff of wind took it aback, and sent it over to leeward. The extra pressure of sail was more than the boat could stand. The lee bow was forced under water, and down went the boat, head foremost, in about six fathoms of water.—Nobody came to grief, though; the boats around soon picked up the crew, while the leading yachts went on their way unheeding. In the beat up the Unknown weathered on the Nautilus, and sailing in grand style, came in a winner by about 2 minutes 23 seconds.

The way the winning boats were handled and sailed defied criticism, and altogether it was one of the best days sport I had seen for a long time. In conclusion I must observe that though the boats are eminently suited to the waters they cruise in, anywhere else they would be mistake. Their long mast stepped so far forwards, the great amount of ballast they take, and their short hull would make them very wet and even dangerous in a heavy sea, while for running or reaching with a beam wind they would be nowhere against a longer boat with a sharp bow and hollow entrance. Their great point in sailing is turning to windward in comparatively smooth water, and at this they are probably unsurpassed by any boats in the world. C. M. D.

OUR PHILADELPHIA LETTER.

PHILADELPHIA, June 5th, 1876.

EDITOR FOREST AND STREAM:—

The second annual regatta of the Vesper Boat Club was held on Saturday, June 3d, over the national course. The first race was for senior single sculls, three entries—H. McMillan, W. T. Corson, and Frank Henderson. McMillan, rowing easily, had a lead from the start, winning in 11 minutes 25 seconds. Corson made a plucky fight at first for the lead, and then for the second position, but at the mile, Henderson, though steering badly and rowing awkwardly, spurted and passed him.

The second race was for double scull gigs—E. M. Hawson, bow; A. L. Beck, stroke; Miles S. Tracy, cox, and H. Evans, bow; W. E. Abbott, stroke; W. J. Kerr, cox. This was close and well fought to Strawberry, where Kerr's crew seemed to be gaining. Soon, however, Tracy's crew had a clean length. Again at the mile Abbott spurted, and was almost lapping, when an unfortunate crab of Evans' ruined their chances. Tracy's crew won in 12 minutes 58 seconds, Kerr's craw, 13 minutes 18 seconds. The rowing of the winners was for the most part execrably bad, although the pluck shown in both boats was excellent.

The junior scull race was the most amusing, if not the most interesting, feature of the regatta. The entries were W. W. Maris, C. F. Godshall, and H. Hutchinson. They all went off at a cracking pace, Hutchinson leading, and Godshall showing the best form; but before they got over the flurry of the start Maris upset, and the other two ran together. Amid shouts of laughter the boats were recalled, and on the second start the men got away much better. The struggle for first position was severe, and all three men steering badly. Maris got from his position on the east clear over to the west bank, and Godshall, also flurried, crowded him ashore. Maris claimed a foul, but being out of "his water" the claim was not allowed. Hutchinson had obtained a lead of two clear lengths, but being pushed by spurt after spurt, he exhausted himself, when Godsball passed him and won in 12 minutes and 28 seconds.

The last race was for four-oared shells—Abbett, bow; Godshall, F. B. Evans, McMillan, stroke; and Hutchinson, bow; Skinner, Corson, Henderson, stroke. McMillan's crew won in 9 minutes and 55 seconds without being pushed. The loser's time was 10:09. Officers of the regatta were W. T. McNeely, umpire; J. B. Mingus, time keeper; C. D. Bickley, E. L. Cauffman, judges.

The entries for the Schuylkill Navy regatta of the 17th were announced at the Naval Board meeting to-night. A falling off in the crew entries is more than made up by the single sculler's list. For this prize there are eight entries, and I think there will not be less than seven starters. Much curiosity is felt to know how Holstman, of the University, will show up in the list. Last year he gave our best scullers a tarribly hard race, and although young and very light, he has skill and pluck. Tasker, of the Crescents, is thought to be fast, and McBeath, of the Quakers, known to be. The four-oared shells will be three, and I think three good ones. Tbe barges, doubles, and pairs bid fair to be walk overs. Pair-oared crews, not only on the Schuylkill, but in America, seem to he weak, the "why of which" is a mystery.

The action of the National Association on Saturday has brought forward an inquiry as to how college crews would be treated in the International race. The Committee very properly decided to-night that the original circular will be adhered to. This means that the Regatta Committee sees no reason why a college man belonging to a boat club other than that of his college, cannot row in the graduate or under-graduate race for that prize, and also enter the open to all contest from a regularly organized amateur association.

The Undine Boat Club, on Saturday, elected Thomas Hart, President; John Hockley, Jr., Vice President; H. S. Woodbury, Secretary and Treasurer; W. R. Tucker, Cox, A. S. Roberts, Vice Cox., and appointed W. R. Tucker and B. L. Keys as representatives to the Naval Board. A review of the Navy will probably be ordered for this or next week.

SCULLS.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

G. F. M., Bath.—Where can I get a copy of "U. S. Infantry Tactics" by "Upton," and price? Ans. Of Van Nostrand, 23 Murray street; don't know the price.

D. H. E., Peotone,—Please give me the address of a publication called the "Ologist," in your next issue? Ans. At Utica, N. Y., S. L. Willard & Co.

J. S. P., New York.—Will you please inform me when close season for woodcock expires in Suffolk county, this State? Ans. See answer to Fair Play in this column.

HAWKER.—Inquiries having been made for "Hawker on Shooting," by Porter, several correspondents offer the same for sale. Those who want them should let us know.

F. C. S., Ithaca, N. Y.—Of whom can I obtain a reliable copy of game laws as now existing in this and other States, and at what price? Ans. "Fur, Fin and Feather;" price, 50 cents. We can send a copy.

INVENTUS.—The fish law of Virginia prohibits the catching of fish with seines in the waters of the State for the space of two months, from the 15th of June to the 15th of August, and the fine for violation is $500 and confiscation of boat and fishing tackle. The Potomac River is not protected.

A READER, New York.—Will you please inform me through the columns of your valuable paper which is the best kind of spaniel to train for a retriever, and where I can obtain a pup cheap? Ans. The Cocker spaniel and Irish water spaniel make good retrievers. Address M. P. McKoon, Franklin, N. Y.

C. F., Portland, Me.—Please answer if you can procure for me Chitty scrope and Ephemera on fly fishing, and the cost of each? Ans. Geo. W. Ford, care of Potts, Young & Co., Cooper Union, will import the books you speak of at a more reasonable charge than any other person we know of. Cost probably $5 each.

J. S., New York.—I have a young hound from very good stock. How can I make a good rabbit dog of her? Does she require any training? Ans. Take your young hound out two or three times with an older dog who will run the track well, and then hunt him alone where rabbits abound and he will soon hunt properly.

P. C., Hyde Park.—Does the law prohibiting the killing of woodcock before the 1st September apply to all the State of New York? Ans. The same laws of this State remain unchanged, the same close seasons in force last year applying to this. This answer will be a reply to a large number of queries similar to the above.

POINTER, Lancaster, Pa.—I expect to spend several weeks at Ocean Beach during August next with my family. Would you advise taking gun, etc., along? Is there anything to shoot at that time there, or at any accessible point near there? Ans. We should advise you to take your gun, as you would probably have fine sport with the bay birds.

A. P. L., Milwaokee.—I have a muzzle-loading rifle, weight 10 lbs.; length of barrel 32 inches; about 36 cal. What is the longest range at which I can properly use it, and what would be the proper charge of powder? Ans. You could use it at 500 yards, but 300 would be more probably its best range. For charge, use from 50 to 70 grains, according to the range.

E. L., San Antonio.—Could you tell me in what respect the different targets for rifle shooting differ? Also the best traps for pigeon shooting, and how to make the same? Ans. The FOREST AND STREAM Hand Book for Riflemen, to be issued this week, will contain the information; price 50 cents. A ground trap which closes with a spring, allowing the sides to drop when pulled is the simplest.

FAIR PLAY, New Hamburgh.—Will you please inform me whether a new game law has been passed the past winter making a close time for woodcock from Jan. 1st to 1st? Ans. The proposed amended game law for this State, although printed, was not passed, and with the exception of some slight alteration regarding penalties, the law remains the same as last year. The close season for woodcock expires all over the State on July 31.

L. S., Wilmington.—Some of my friends say the steamship lines will not allow dogs on board, and that there is much trouble attending the bringing home of dogs. Can you give me any information on the subject, as to what lines, if any, will allow dogs to be taken on, the duty on them and probable cost of transportation? Ans. Either the Inman, Williams & Guion, or National Lines, will bring dogs. The regular fare is £3, 3s. with a small fee to the butcher.

W. C., Inwood.—In the faces of my setter pups 10 weeks old and one 8 months old, I observe a number of flat worms about three-quarters of an inch long. Is kind enough to prescribe something. Do you think these worms come from feeding unboiled milk? Ans. We have mailed to you the proper doses of areca nut to earn you pups, with directions for administering. We have used new milk unboiled considerably as food for pups, without any injurious effects.

C. S. J., Newton.—I have noticed during the last few days a constant decrease in the size of the warts in my dog's mouth, and I am in hopes that Dame Nature will soon cause their entire disappearance. What do you think of the dry nose which has been so for some time? I tried anointing it with glycerine for a while, but without any noticable improvement. Can you give any cause for and the cure for the same? Ans. Try feeding your dog with boiled beef's liver a few days.

X. Y. Z., Lake City—OMICRON.—In a recent number of your paper a correspondent inquired what was the market price for alligator skins. Now, can you tell me if there is a manufactory at the North for making leather of them, or are they sent across the Atlantic? Ans. There is an extensive manufactory at Kulztown, Pa. The skins have been mostly obtained from South America, and the leather is in good demand for the manufacture of water-proof boots, being perfectly impervious to water.

A. B. C., Boston.—1. Can you tell me what rifles Messrs. Gildersleeve, Bodine, Hepburn, and Washburne are now using at Creedmoor? 2. What brand of powder and what sized grain do most of them use when shooting 105 grain charges? 3. Do you consider the Remington rifle superior to Sharp's for accuracy at long range? Ans. 1. The first named Sharp's and the others Remington's. 2. Hazard F. G. 3. See the Annual Report of the National Rifle Association for 1873-4-5, the latter to be issued in a few days.

SALMO, Forcroft, Me.—I propose building a boat to take the place of a canoe. I think of planking it with ⅛ inch stuff, and then papering it with a number of thicknesses of tough Manilla paper, but here is where the trouble comes. I want a waterproof glue to apply it with. Please inform me of something. Ans. The Nova Scotia boat referred to in our columns this week seems to meet your requirements. Shellac varnish mixed with linseed oil is used for outside waterproofing. Send us the notes on Landlocked Salmon.

A. H. L., Pittsburgh.—Can you furnish us with the names of some parties from whom trout for stocking a pond can be purchased, and also give us the name of a good work on the cultivation of trout for the use of the party who will have it in charge? Ans. For fish, address Thompson & Tagg, New Hope, Bucks county, Pa.; John Gay, Pittsburgh; Clapp, Stone & Co., Tiona, Warren county, Pa.; S. C. Upham, Media, Pa. Buy "Domesticated Trout," by Livingston Stone, and "Fish Culture," by Seth Green, for sale by D. M. Dewey, Rochester.

SINBAD.—Is there any Florida Land Agency in this city; if so where Ans. Several, we believe. Possibly the most reliable is the "Florida Land and Immigration Company," Hon. E. N. Dickerson, of New York city, President. There is an agency in charge of Col. J. B. Oliver, at the Fulton Bank Building, Brooklyn, N. Y. The company have 650,000 acres of land along the line of the Atlantic, Gulf and West India Transit Railroad, and offer 200,000 acres to be selected by settlers. The lands to be selected are represented by 5,000 floats or land warrants. The purchasers can locate anywhere upon the land owned by the company.

GNIP, Newton, Mass.—1. Can you give me the name of some principal man, or chief, of the Penobscot tribe of Indians in Oldtown, Maine, so that I could obtain some of their goods? 2. What is the barrel of the new Ballard rifle made of? 3. I have some duplicate numbers of F. and S. in good order. Can I exchange them for others I have not got? 4. Is there any article about headwaters of Connecticut River in any previous number of F. and S.? Ans. 1. If you will write to E. M. Stillwell, Bangor, he will tell you how to get Indian goods from Oldtown. 2. Of steel, first cast in bars, and afterwards rolled and finished. 3. Yes; send them along. 4. Vol. II, No. 4, page 59.

CORD, Augusta, Me.—I write for some information respecting black bass put into a large lake in this vicinity some seven years since. Last year we caught some in the outlet of the lake in rapid water, using trolling spoons and spinning minnows. We commenced to take them about July 10th. I wish to know if they can be taken earlier, if so, whether to fish in still or rapid water for them, and what kind of bait to use? Ans. Your fish are busy spawning in still water at the time you speak of, and you have no right to take them then, either by law or nature. When they are fit to be caught they go into the rapids, and their appearance there is one of the best means to determine the close and open seasons. Minnows are the best bait.

A. J. T., Bangor, Me.—Who are the officers of the Florida Land and Immigration Co.? If their lands are really valuable, how can they be sold so low? Ans. Edward N. Dickerson, New York City, President; Samuel A. Swann, Commissioner, Farnandina, Fla.; and J. B. Oliver, General Agent, Brooklyn, New York. The low price of $1.25 per acre for selected land, still further greatly reduced by almost free transportation, is only an evidence of the anxiety of the company to settle up 240,000 acres of their 650,000 with desirable immigrants from the North and West. The lands are known to be good, the titles complete, the country healthy, and the people the most kindly disposed toward new comers. We again refer for maps and full particulars to the General Agent, Col. J. B. Oliver, No. 361 Fulton street, Brooklyn, N. Y.

ADIRONDACKS.—A correspondent reminds us that the new route to Lake Pleasant by the Adirondack Railroad is much better, shorter, and easier than the one we mentioned last week. By reaching Fonda, on N. Y. C. R. R., about 10:30 A. M., a train on our new railroad takes one to Northville at 12 noon, thus saving some twenty-five miles stage coach over rough roads, or a party leaving New York at 8 A. M. can go through to Northville by dark, thus reaching the edge of the Wilderness and within twenty miles of Lake Pleasant the same day. Myself, with a party of four, for a week past had very good luck, and an excellent time speckled trout fishing at Jockey Bush Lake, Hamilton county (S. W. corner). By-the-way, why don't Ely correct his map of that section? There are twenty lakes he has not got down.—M. S, NORTHRUP.

CONSTANT READER.—Will you kindly inform me what is the best work published on the art of making and using artificial flies? Ans. We have replied to this interrogatory a great many times. There is no American work of this sort. Norris, Roosevelt, Scott's, and Forrester's works all contain information. Perhaps you will find in the columns of FOREST AND STREAM what is combined in those works. Read the illustrated articles of Thad. Norris, Esq., in Vol. II of this journal, and those of Miss McBride, more recently, in the current volume. There are several valuable English works on fly dressing—notably, Ronald's Fly Fisher's Entomology; Chitty's Fisher's Text Book; Pullman's Fly Fishing; Bridgett-Pennell's Fly Fishing, and Ephemera's Hand-Books. These you can order from England, or through dealers in foreign books here.

J. R. E., Elizabeth, N. J.—What is the usual evaporation of an acre of water, and how in a rough way can I ascertain the number of gallons a stream of water discharges within a given time. I have ground through which a small stream flows, that could easily be constructed as a pond if the supply will equal the evaporation through the summer months? Ans. It would first be necessary to know the capacity of your stream and the present depth of water in your pond, when the pond could be made proportionate to the size of the stream if the latter was constant and never failing. The evaporation is about one fifth of an inch or less per day, and could be disregarded. We would suggest to our correspondent to buy Trautwine's "Engineers Pocket Book," to be had of Van Nostrand, 23 Murray street, in which he will find the information he wants; or better still, employ a professional engineer to lay out his pond.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, JUNE 8, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Editor and Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, June 8th.—Racing: Jerome Park. Trotting: Belmont Park, Phila.; Dubuque, Iowa; Medina, N. Y.; Washington, D. C.; Beacon Park, Boston. Regatta: New York Yacht Club. Base-Ball: St. Louis vs. Hartford, at Hartford; Chicago vs. Athletic, at Philadelphia; Cincinnati vs. Mutual, at Brooklyn; Louisville vs. Boston, at Boston; Alaska vs. Chelsea, at Brooklyn; Madison vs. Lexington, at Brooklyn; Rose Hill vs. Jasper, at Manhattanville, N. Y. Pigeon Shooting Tournament at St. Paul, Minn.

FRIDAY, June 9th.—Trotting: Belmont Park, Phila.; Washington, D. C.; Pottstown, Pa.; Beacon Park, Boston; Sharon, Pa. Base-Ball: Mutual vs. Argyle, at Brooklyn.

SATURDAY, June 10.—Racing: Jerome Park. Trotting: Sharon, Pa. Brooklyn Yacht Club Regatta: Seawanhaka Yacht Club Corinthian Regatta for sloops. Rensselaer Polytechnic Institute Rowing Races, Troy, N. Y. Neptune Rowing Club Regatta: Staten Island; Columbia Boat Club, of Brooklyn Regatta. Base-Ball: St. Louis vs. Hartford, at Hartford; Chicago vs. Athletic, at Philadelphia, Cincinnati vs. Mutual, at Brooklyn; Louisville vs. Boston, at Boston; Madison vs. Olympic, at Brooklyn; Orange vs. Athletic, at Orange; Osceola vs. Olympic, at Brooklyn.

MONDAY, June 12th.—Regatta Columbia Yacht Club. Base-Ball: Alaska vs. Olympic, at Melrose.

TUESDAY, June 13th.—Racing: Jerome Park. Trotting: Buffalo, N. Y.; Elmira, N. Y.; Homer, N. Y.; Point Breeze Park, Philadelphia; Grand Rapids, Mich.; Pera, Ind. Seawanhaka Schooner Regatta. Competition for places on American Team: Creedmoor. Base-Ball: Louisville vs. Hartford, at Hartford; Orange vs. Star, at Orange.

WEDNESDAY, June 14th.—Trotting as above. Last competition for places on American Team.

ANNOUNCEMENT.—Mr. Wm. C. Harris having resigned the office of business manager of FOREST AND STREAM, the editorial and business management of the paper, will from this date be under the sole charge of Mr. Charles Hallock, its original proprietor. The Philadelphia branch office is discontinued, and there will be no other office than the present general publication office at 17 Chatham street, New York.

TO PATRONS IN ARREARS.—In view of the change in the business management of this paper, we beg those who are in arrears for subscriptions and advertisements to pay up at once, so that we may square accounts to June 1st, and wipe off the old slate.

☞ Hereafter we shall stop our paper two weeks after the term of subscription expires, without farther notification.

— Colonel Delancey Kane, the New York amateur stage coachman, is a great-grandson of the late John Jacob Astor.

COUNTY DELEGATES TO STATE CONVENTIONS.

OUR readers are aware that it has been a custom of late years to admit to the privileges of the State Sportsman's Association at the annual conventions a number of gentlemen as County Delegates, from counties wherein no sportsman's clubs had been organized. It is most probable, from the action taken at the recent convention, that the custom will be done away with. It certainly should be. Any county which cannot number sufficient sportsmen to form a club for the protection of their own game, not only deserve to have no game, but are clearly not entitled to the privileges of the Association. The question was very pertinently put at Geneseo. "Who are to appoint County Delegates? Are they to come armed with certificates of good moral character from their pastor, Sunday school Superintendent, Justice of the Peace, or, as one gentleman suggested, the village undertaker?" The admittance of these unauthorized delegates is a direct premium *against* the formation of sportsman's clubs, and although we sympathise with the gentlemen from Steuben and Chatauqua, we approve of the action of the convention in refusing to recognize them. The effects would be the same as if irresponsible or unauthorized persons were to be admitted to the deliberations of our Legislature on equal footing with the people's duly elected representatives. We presume this proposition was thoughtlessly introduced by persons who wished to imitate the action of the National Convention at Cleveland just one year ago, thinking that wisdom centred in that body. For their edification we will explain why the Cleveland Convention voted to admit individuals not connected with any club, and isolated clubs from States having no State Association, on the same terms as regularly accredited delegates from State Associations. It was to get rid of the necessity for adopting the resolution offered by the Secretary of the "International Association for Protecting Game and Fish," inviting a conference between the Committees of the two bodies on Nomenclature and Distribution of Species, with the view, as stated in the text of the resolution, "to secure all the information and wisdom that can be obtained upon the important matters under consideration." This action having been taken as to the admission of individual members, the Convention was the better prepared for the report of the Executive Committee, rejecting the conference resolution. We quote from that report as follows:

"We [the Executive Committee] submit that the admission of new clubs and new members covers the ground comprised in this resolution. The gentlemen members of the International Association for Protecting Game and Fish may become members of the association, *if they so desire*."

The design was to utilize the efforts of its cognate body or cousin germain by absorption, which would be equivalent to wiping it out—this latter object being then evidently paramount to its avowed purpose of protecting game. We do not bring this matter up by way of accusation, but to show that motives, often not clear to outsiders, govern actions of deliberative bodies, and that what is sauce for the goose may not always be sauce for the gander. The National Association will eventually discover, if it has not already done so, that its action of last year was ill-advised, and that its deliberations will be clogged by extraneous matter, which, having been introduced ostensibly as a lubricator may prove to be only dirt to impair the movements of the machine. We are glad to see that at our Genesco Convention a large majority were found to champion the principle for which we strugged at Cleveland single handed.

SEA ISLAND SHEEP.—In our issue of November 18th, 1875, Vol. V. No. 15, page 228, we published a very interesting article upon a curious breed of sheep to be found upon the islands off the coast of Maine. We have now been favored with a long and interesting letter from the owner of the sheep and the proprietor of the island whereon they live together with a sample of the fleece, which measures *nine* inches in length, and is of very fine texture. We print the following extract from the letter:—

MACHIAS, Me., April 22d, 1876.

EDITOR FOREST AND STREAM:—

A friend of mine had the kindness to loan me a file of the FOREST AND STREAM which I have been reading of late with a great deal of pleasure and some profit. I notice an article in the issue dated November 18th, 1875, headed "Sea Island sheep," which I have reason to suppose means me. Said article must have been taken originally from a letter I wrote by request (with no idea of its being published) to John L. Hayes, Esq., editor of the "Bulletin of the National Association of the Wool Manufactures," and which he inserted in the "Bulletin" for January and March, 1875. My Post-office address is as above, but I live on Rogue Island in Englishman's Bay. This island contains about 1,400 acres. I have now something over 300 of those curious sheep. With the exception of about 50, which have been around my barn and had hay thrown out to them when the ground was covered with snow, they have not been fed or housed, but have got their living entirely, with no shelter but woods. The only secret about it is, they must be born and reared on the sea shore. I have bought several "barn sheep" and brought to the island, but they invariably need shelter and care in the winter. All of the islands along this coast, as far as I am acquainted, are stocked more or less with sheep, which if let alone, would get their living the year around, but the sheep thieves are so troublesome of late that some take their sheep home winters. I picked up a dead sheep on the shore the other day that I suppose was washed off a ledge and drowned, which had a two or three years' fleece. I inclose a sample.

GILBERT LONGFELLOW.

—It is said that the Allen Line steamers are to make Miramichi, instead of Halifax and Portland, the terminus of their Atlantic trips from Great Britain.

GAME PROTECTION.

—The law prohibiting the taking of any salmon, shad, alewives, or other migratory fish in any manner but with single hook and line, within five hundred yards of any dam, mill race or fishway, was repealed by the Maine legislature of last year without the knowledge or consent of the commissioners of fisheries. Under the new law every dam operates as a trap, where the fish are stopped and collected, the more readily to be swept into the nets of the fishermen. The present law allows four days close time, within which "no salmon, shad, alewives, or bass shall be taken or destroyed in the Penobscot River, etc., above the railroad bridge between Bangor and Brewer, etc. The text of the law reads:—

"Between said Thursday and Sunday at sunrise, as aforesaid, it shall be lawful to take any of said fish in said waters above said bridge, any law to the contrary notwithstanding. Any person violating the provisions of this act shall be liable to a penalty of fifteen dollars for each salmon, and five dollars for each fish aforesaid, *taken or destroyed* from or in such waters during the period above interdicted."

This act was passed February 7th, 1876. Mr. E. M. Stillwell, the efficient State Fish Commissioner, has shown most praiseworthy energy in his effort to counteract the mischief which this law promises to make; and in an article printed in the Bangor *Whig and Courier* he refers to the provisions of the act, as embodied in the clause quoted, as follows:—

"That is to say, according to their interpretation of their own law they may *fish* during the close time, but cannot be punished unless they can be convicted of *catching fish*. It is worthy of a Legislature that passed a law for the protection of *pickerel*, and cut down the appropriation for our Agricultural College. We now appeal to our fellow citizens, to the people at large, for aid in this emergency. If the inhabitants on our rivers are not with us, if they are not willing to furnish us with evidence of all infractions of the law, a standing army of wardens, or police officers, or constables would be of no avail.

"The issue now is, 'shall we allow all the time and money that has been expended in efforts to restock the Penobscot and its tributaries, to be sacrificed to a few unprincipled men who would kill the last pair of salmon in the river if they could make a dollar by it.' If any person will furnish us with sufficient evidence to convict any of these men of fishing during the close time, viz.: between sunrise on Sunday and sunrise on Thursday, with nets, or with *traps*, or *pots* at *any time*, we will endeavor to convince them that there is a different reading to the statute they framed to give impunity to crime. Complaints left at my office, with names of witnesses, or with City Marshall Walker will be promptly acted upon.

"E. M. STILLWELL,
"Commissioner of Fisheries for State of Maine."

—The "Forest and Stream" Club of Scranton, Pa., organized in February, 1875, already has 100 members, and is exerting much healthful influence throughout the County of Luzerne, in inducing proper respect for the game laws. Several violators have been prosecuted and fined or imprisoned. This club has a shoot on the 24th, 25th, and 26th of this month.

INDIANA.—A society has been formed at Valparaiso, Ind., known as the Porter County Society for the Protection and Propagation of Fish. The officers are, President, W. H. Holahird; Vice-President, Orin Wells; Secretary, W. H. Vail; Treasurer, Abe Marsh. Near Valparaiso in a chain of thirteen little lakes, and one of the main objects of the society was to prevent the spearing of fish during the spring and fall months. The President writes us that the efforts of the society have been so obnoxious to the poachers in the vicinity that they have retaliated by destroying his boats, and at last by killing his favorite dog. We trust that Mr. Holabird may succeed in having the miscreants punished, and that the objects of his society may be fully accomplished.

—Our Texas correspondent sends us a letter published in the Gainesville *News*, and dated at O'Brian's Camp, near Fort Griffin, which gives the results of a buffalo hunt from the middle of March up to date, as follows:—

"Jesse Benton and I have 325 hides of our own, and we are now hunting in partnership with James Ennis. Day before yesterday we killed 46 buffaloes, and yesterday 38. We may hunt all summer, as buffaloes are gentler in summer than in winter, but the hides are harder to save.

"J. C. VAUGHN."

Fort Griffin is on the Clear Fork of the Brazos River, about 150 miles a little southwest of Gainesville and is a good buffalo country. Our correspondent says very pointedly:—

"It may look like 'going back on' my former argument in favor of McCarty's Big Hunt, but this wholesale killing for skins is too much of a good thing. I do not know how many parties I have heard of being in that locality last winter, but I did think that when the summer came it would be stopped."

The recent law of Congress to prevent the wholesale destruction of buffalo will fix the flints for these fellows, if some one can be found bold enough to prosecute them.

THE NEW PENNSYLVANIA GAME LAW.—By the new game law, amending and consolidating the several acts relating to game and fish, passed on the last day of the session, deer may be killed from October 1st to January 1st; gray, black, and fox squirrels from August 1st to January 1st; woodcock from July 4th to January 1st, partridge, or quail, and rabbit from October 15th to December 15th; pheasant from October 1st to January 1st; trout and salmon from April 1st to August 15th; black bass from July 1st to March 1st, and only with rod, hook, and line. The bill imposes a penalty of $20 for killing, catching, or discharging any firearms at any wild pigeon while on its nesting ground, or in any manner disturbing such nesting ground; a fine of five dollars for killing any insectiverous bird, and a fine of $25 for hunting and fishing on Sunday.

—The Sodus "Bay Club," of Sodus Point, New York, has at last taken the game laws in its own hands, and will push them. A correspondent says:—

"It has been an outrage the way the fishermen have been hauling seines in Great Sodus Bay, catching thousands of bass, pickerel, and pike when spawning, so that during the summer months spoon fishing or trolling is one of the things of the past. The following resolution was passed at today's meeting.

"That the President, Dr. Coventry, and the Attorney, Jos. Briggs, and Mr. Chas. Perkins, of the club, be appointed a committee to investigate and take such steps as they may deem necessary to enforce the game laws so far as they relate to the waters of Great Sodus Bay, and that this club appropriate the sum of $250 for the above purpose."

A POTENTIAL GAME PROTECTIVE CLUB.—Like all its other products, the Game Protective Club of California is big. Our correspondent, E. J. Hooper, tells us all about it in the following letter:—

SAN FRANCISCO, May, 1876.

EDITOR FOREST AND STREAM:—

We are progressing capitally with our new club. The membership already numbers about 140 sportsmen and patrons of protection for all kinds of fish and game. A good foundation for successful operations in all the objects of the society's formation has been made at this early day in the possession of several thousands of dollars in the treasury. At a late meeting, a resolution was passed offering a reward of $50 for every case of infringement of the game and fish laws, members also pledging themselves to report every instance of such violations under penalty of forfeiture of membership. Besides the fresh water Lake Merced, only five miles from the city, and well stocked with salmon and trout, the society has leased the fresh water lakes San Andreas and Pillareitos, the former stocked with silver salmon and brook trout, and the latter also with abundance of brook trout, with another large fresh water reservoir in their vicinity, distant, severally, from twenty-five to thirty-five miles from San Francisco. At each of these fine pieces of water, club houses are being prepared for the accommodation of the members, with boats, etc. When everything of this kind is consummated, with probably some other pieces of water and streams, and more privileges and advantages for members, this society will possess as many, if not more, opportunities for sport and recreation than any other similar club in the world, and most of them very convenient to the metropolis of the State. Outside persons are allowed to purchase permits for fishing in the company's waters at a reasonable rate.

—At a meeting of the North Carolina Press Association at New Berne, in May, a reply to the toast "*Our Fishing Interests*," Hon. J. E. West said:—

"The fish of North Carolina are worth more to the people of the State in net money than the cotton crop. Tens of thousands of our people depend upon the supply of oysters and their fish (as our Revised Code has it) for their food supply. The banks of the Pamlico, Albermarle, Bogue, Currituck, and Core Sounds of the Nense, Cape Fear Roanoke, Chowan, and Tar Rivers are thronged with this class of people. My friends Lane, Watson, and Daniels, with possibly one or two others, pay to fishermen here in New Berne alone some $75,000 a year for fresh fish just for shipment, to say nothing of the immense sums of money paid directly to them by retail dealers, or by the consumers amounting to not less than $150,000 a year. Then again vast quantities of shad, rock, herring, etc., are packed, salted, and shipped by the fishermen themselves, who have invested here some $25,000 in boats, seines, etc., and employ about 200 hands, representing the same number of families. The Southern Express Company has carried over our railroad within a few months nearly nine thousand tubs of fresh fish, to say nothing of the tens of thousands of gallons of oysters and scallops, thousands upon thousands of clams, turtle, and shrimp shipped by steamer and sailing vessels, or by rail as freight. Yes, sir, we sow not and still we reap this bountiful harvest, this great gift of a beneficent Providence.

The Delaware and Chesapeake Bays are being steadily depleted of their supplies of oysters, new planting grounds are eagerly sought, the creeks and thoroughfares of North Carolina offer superior inducements to dealers in the bivalves, and the six hundred oyster boats that I have seen at one time oystering in the Delaware will soon whiten our own waters. This industry with us is just in its infancy. The few thousand bushels planted by my friend Ives, of Beanford, will soon swell into millions, and every acre of oyster ground be worth not less than one thousand dollars. Talk of your Nevada and Arizona gold mines, why, sir, we have a big Bonanza at our very doors, a mine that will return, if properly worked, untold gold. * * *

It is our duty to protect this great gift by proper protective legislation, by enacting stringent laws requiring all nets and seines to be removed from the navigable waters of our State, say Friday night at sunset, and not set again until Monday morning at sunrise, during the season our food fishes are ascending the rivers and creeks for the purpose of depositing their spawn, providing means to restock our rivers, now nearly depleted of fish, by artificial means, etc., etc."

—A correspondent speaks of some high-handed proceedings lately in the Adirondacks. If such doings are probable in future we advise no one to go into the woods without a rifle and army revolver:—

ADIRONDACKS, May 30th, 1876.

EDITOR FOREST AND STREAM:—

Quite an affray took place in Fish Creek Bay, Saranac Lake, last week. The Hoyt-Romeyn party, hearing of set lines in the bay, went to the camp of the St. Germains, who were violating the law, and remonstrated with them. They were defied, assuming that they had the right to "fish as they please, and would." Col. H. assured them he would cut their nets and lines, if not removed. Insolence demanded immediate action, and their nets were cut, but the lines were trolled for unsuccessfully. The next day the Hon. W. A. Wheeler's party was fired into while trolling in the bay, while removing hooks from the set-line, accidentally becoming caught. The ball passed near the row-lock, through the boat. Undoubtedly they supposed they were firing at the former party. The next day, in trolling, I understand the sportsmen went armed, and though passing the camp of the desperadoes all was quiet. What the result will be remains to be seen. The sheriff of Franklin county has been written to, and it is presumed that the Wheeler party will see that the offenders are brought to justice and the law maintained. Here they have no game constables. We need State Fish Commissioners to visit the lakes and summarily arrest all violators of the law; hotel keepers and guides will not do it.

O. P. Q.

ILLICIT WHISKEY.—Major Jacob Wagner's mounted revenue force, to which the editor of this journal was permitted to attach himself for a period of several weeks last fall, has recently finished a most successful campaign, having nobly sustained the American flag, and demolished an inordinate amount of contraband whiskey. No less than 130 illicit distilleries were broken up and 128 arrests made, while property enough was captured to far more than pay the expenses incurred by the Government. These concerns were capable of producing fully thirteen hundred gallons of whiskey each day, the tax of which, at ninety cents per gallon, made quite a loss to the Government.

The operations of Major Wagner's force have extended along the Blue Ridge, where the States of North and South Carolina, Georgia, Virginia, and Tennessee border, and the duty required some personal risk as well as the exercise of considerable hard work and ingenuity to discover the distilleries, which were usually sequestered among the foot hills and well concealed. The offenders were tried before United States Circuit Court at Charleston, S. C., and sentenced to pay fines and suffer imprisonment in sums as high as $500, and terms as long as three years. Fifty of these prisoners signed a petition praying for clemency, and begging their friends to never violate the revenue laws again. They declared their readiness to bind themselves under oath never to still again illicitly. To Major Wagner is due the whole management and engineering of the suppression of this illegal traffic.

MCCARTY'S BIG HUNT HEARD FROM.—Some considerable stir was created a year and a half ago by Col. McCarthy's announcement of a grand buffalo hunt in Texas and the mountains, so magnificent in its appointments and proportions as to eclipse the Prince of Wales' battues in India. The publication of this in our paper excited great indignation against wholesale and indiscriminate slaughter, although some persons were inclined to favor McCarthy's project. Many thought McCarthy and his expedition to be frauds, while others predicted its annihilation by starvation or Indians, if it was undertaken. We lost sight of the whole affair in the dust that was raised, and had forgotten that such an expedition was ever talked of, until we received the following statement from our regular Texas correspondent, whose word can always be relied upon, and from which it appears that the redoubtable Col. did really attempt to carry out his programme, or some part of it, despite all slurs and innuendoes:—

GAINESVILLE, Cooke county, May 20th, 1876.

EDITOR FOREST AND STREAM:—

I met Mr. A. G. Crowell, of the Montague *News*, recently, (who was a surveyor for some years on the border) who told me that he saw McCarthy and party as they passed through Montague and as they returned. They only went to the Copper Regloo. Crowell says he printed them a lot of ball tickets as they went out, and they had a big time, but as they returned they were rather low spirited. C. says McCarthy is living in Dallas, Texas.

G. H. R.

THE PLEASURES OF ANGLING. By Geo. Dawson, Editor of the Albany *Journal*: Sheldon & Co., New York.

This is a Vade Mecum for salmon anglers. It is the only American book that treats *secunden artem* of the technology of angling for salmon. Hallock's "Fishing Tourist" is comprehensive in its designation of salmon rivers, but it does not attempt to impart much instruction in the art of handling fish or rods. The author assumes that he is speaking to adepts and not to pupils, which is an error of judgment, inasmuch as there are not two dozen salmon anglers in the United States, outside the city of New York, as the venerable Mr. Dawson remarks in his work. Because Mr. Hallock had the advantage of several years' residence in Canada, where salmon anglers are as numerous as salmon rivers, it was perhaps natural for him to forget that his relatives across the border had not been trained in the same school as himself. He made a similar error in his noteworthy illustrated article published in *Harper's Magazine* several years ago, entitled the "Restigouche," writing as if to the well informed. The Restigouche is the largest and most romantic salmon river in Canada, and was one of the first which the Dominion Government placed its protective restrictions upon. Without doubt Mr. Hallock's article was the first direct means of awakening the attention of American gentlemen to the delights of this pastime, and the facilities for its enjoyment which the Provinces offered. At least two score of trout anglers have since become ambidextrous experts, who had not before dreamed of even taking a salmon, or realized how superlative was the sport beyond anything that had come within their practice or conception. Nevertheless, the proportion of Walton's disciples is so small that the "Fishing Tourist" has never received that consideration which a work catering to more universal tastes would have commanded. When, as at our State Sportsmen's Convention, 10,000 pigeons are shot at, and the call is for more, while only three contestants are mustered for the fly-casting competition, it cannot be wondered at that there is little show of appreciation for works on angling. However, it is not altogether indifference to this subject that makes the authors sad; there are thousands of people in the United States anxious for the very information these books impart, who would study it *con amore* if their attention were properly directed to them, with judicious advice as to the selection. The truth is that this class of books is laid out of sight by the reviewers, who draw a sheet over them, depositing them with a chaplet and a pæan in the general literary receiving vault, where they may mould away, or be resurrected, according to chances or the solicitude of friends. We trust that no such fate will befall the admirable book before us, namely, Mr. Dawson's "Pleasures of Angling."

The venerable author appreciates at the outset the disadvantages which we have designated above, albeit a few admirers of the Gentle Art have importuned him to write; and he even humbles himself to apologize for what he imagines younger men may interpret as the garrulity of his age. Nevertheless, as he writes, his enthusiasm for the old sport kindles, and he becomes oblivious to all things but the woods and the streams, and the witchery of his favorite vocation. He pleads for it, not only for its present allurements, but because the reminiscences it conjures up are a solace and tangible joy to declining years. However, we think Mr. Dawson too ready to bend his shoulders to the mantle of outlived usefulness. Mr. Dawson is only relatively old—not yet sixty, we believe. Only last week a venerable gentleman whom all the world reveres, did us the honor to climb the stairs that lead to our office to make a complimentary visit. He was hale, vigorous, and full of vivacity, and as well preserved as a person of much younger years. His name was William Cullen Bryant, and his age was 82! Mr. Dawson *may* be as vigorous at 82, and Mr. Bryant may live to write a centennary ode, as he promises.

Mr. Dawson tells us in his book why salmon angling fills a higher plane of ecstacy than pin-hook fishing and intermediate grades of the art, and having touched upon the charms of natural belongings, as all sojourners in the wildwoods are wont to do, he shows how the avocation gives healthful vitality, robust constitutions, and prolonged years; and in succeeding chapters he reverts to the abundance of salmon in past times, the causes of their depletion since, and the inducements that led the Canadian Government first, and our own afterwards, to undertake their restoration and preservation. He gives necessary information as to leases of Canadian rivers, and regulations governing fishing therein; the duties and wages of overseers and wardens, the system under which they work, fines and penalties for violations of protective laws, the effect thereof upon the people, and the general benefit that has resulted. Leases, we find, apply only to salmon; trout fishing is unrestricted throughout the Dominion. Mr. Dawson pays the Canadians the high compliment of saying that they never do anything by halves, and we wish to add our own personal testimony to his assertions. Our State Governments can do no better than to imitate them, and Mr. Dawson's pen labors to stimulate them to the endeavor.

The author reaches the marrow of his subject by gradual approaches, and having mentioned several prominent anglers of Canada (we could multiply his list ten-fold at least), he comes, on the 46th page of the book, to his fishing outfit, which he shows us costs not less than $100 for tackle alone; tells us the best routes by which to reach the rivers, and the time to start, and at last embarks in his canoe with kit and guides, at the Caseapodia River, on the Gaspe side of the Bay Chaleur. The canoes are described, and the mode of paddling, or poling, as circumstances require; camp is made, the first fly is cast, and the vacation experience begins. The author imparts what he learns in the acquisition *grado passu*, relates many an exciting incident of loss and capture and patience under trying difficulties, and gives enough instruction at odd times—here a little and there a little—to transform a tyro into an expert, if it were only followed. Perhaps we shall weave this material into a chapter for the edification of our readers. Then follow observations on the habits of salmon, incidentally interspersed speculations as to what they eat, and declarations as to what they are when eaten. The book is divided into three sections, the last devoted to trout fishing, and it may be imagined that the author gathers improvement by experience—that he becomes more oracular and useful as he gains confidence by acquired knowledge. One thing is certain: He does not venture to describe untrodden ground. Whatever he says may be depended upon as the fruits of careful observation and cautious reflection. This is a comfort. It is a satisfaction to know that we can read without fear of being misled.

We leave our review now, not because we have touched with a needle, as the bee does, all the sweet and salient points in the book, but because to present a complete review would be to reprint the book itself; and as the latter is copyrighted, the best we can do is to advise all who read these lines to buy it. Part the 3rd, we should say, treats of rambles among the Adirondacks.

ANOTHER STYLE OF CANOE.—Some time ago, a Nova Scotia correspondent incidentally mentioned in a narrative of his, a canoe made of a frame and canvas that he used in fishing. He has since sent a description of it, at our request—which we print herewith:—

YARMOUTH, Nova Scotia.

EDITOR FOREST AND STREAM:—

I do not know of any manufacturer of such as mine. It was made by Mr. John Richards, of Yarmouth, for his own use, and I got it of him. He is an insurance clerk, but would probably make a canoe to order for any one, in his spare time, for $30 or $40. I do not know who was the inventor. The first in Yarmouth was made here by Mr. Joseph Johnson, machinist, from Bangor, Me. I cannot say exactly how constructed, but think that the gunwale is made first, to which ribs of pine, about two inches wide by an eighth thick, are bent in the form desired. Longitudinal strips of the same are then tacked as closely as possible to the ribs outside, and over oil, a covering of canvas is tightly stretched. A keel of pines an inch wide and one-half inch thick (tapering at the sides) is then screwed on, and the whole outside coated with shellac varnish, in which a little boiled linseed oil has been mixed. This makes a perfectly waterproof canoe capable of standing hard knocks. Such a one, fourteen feet long, will weigh about fifty pounds.

W. A. L.

—The pillory is in use on Prince Edward's Island, Gulf of St. Lawrence.

The Rifle.

THE TEAM COMPETITION.—It is questionable whether the autocrats who rule the destinies of the N. R. A. and the Amateur Rifle Club have acted wisely in stultifying their own contracts with the men who have gained positions among the number who are entitled to compete in the second series of matches for places on the team which is to represent this country in the approaching International contests. The action we allude to is in adding eight more men, who have not qualified, to the sixteen who have. The object may be, and probably is, to secure the strongest team possible, but in view of the difficulty already existing in persuading riflemen from a distance to come here and compete, we regard the action of the Joint Committee as injudicious, and likely to cause future similar competitions to be looked upon as farces. It would have been better to have admitted the entire body of defeated competitors to a new trial; but we fear that in any event the result will be to cause ill-feeling and disappointment.

THE AMERICAN TEAM.—The first competition for places on the team of eight men which is to represent this country in the approaching Centennial matches, was shot at Creedmoor last week, occupying two days. On the first day there were thirty-nine competitors, including Dakin, Yale, and Fulton, of the old team, with Ballard, Bruce, and Canfield. Col. Bodine was absent through sickness. On the following day three of the thirty-nine failed to appear. The shooting, however, was much better, and Major Fulton, who had shot very badly on the first day, improved so much as to bring himself within the list of the chosen. The names and scores of the sixteen from among whom the team should have been chosen according to the published programme are as follows: the conditions being 15 shots each at 800 and 900 yards, and 20 at 1,000 yards:—

	First day.	Second day.	Total.
Dakin	211	222	433
Rathbone	204	208	412
Anderson	199	202	401
Hyde	194	207	401
Yale	190	207	397
Raymond	195	197	392
Ballard	197	195	392
Wadsworth	197	190	387
T. H. Gray	194	193	387
Overnagh	177	198	375
Jewell	177	206	383
Duesenbury	179	205	384
Judd	188	195	384
Bruce	188	193	381
Salter	190	191	381
Fulton	173	206	379

It was subsequently decided, however, by the Joint Committee to admit eight more men to the second competition. The other total scores made on the two days were as follows:—

Name.	Total.	Name.	Total.
Blydenburgh	379	Allen	351
R. S. Gry	378	Howe	351
Elmendorf	376	H. H. Hebbard	346
Weger	369	Canfield	345
C. C. Hebbard	367	Conlin	340
Smyth	366	Robbetin	333
Farwell	362	Jackson	314
Fisher	358	Hennion	309
Lamb	356	Shew	294
Hodgman	354	Morse	237

CREEDMOOR.—But one match was shot at Creedmoor on Saturday last, the Luther Badge, open only to members of the Amateur Rifle Club. The *Spirit of the Times* badge contest having for some reason been postponed. The conditions of the match shot were, five shots each at 800, 900, and 1,000 yards. The scores were as follows:—

Names.	700 Yds.	800 Yds.	900 Yds.	Total
W. B. Farwell	25	24	19	68
C. E. Blydenburg	24	18	20	62
L. Geiger	24	21	17	62
H. Fisher	20	18	23	60
A. Anderson	22	18	20	60
R. Rathbone	24	20	18	60
A. R. Swan	23	18	19	59

Col. Farwell having won the badge on two previous occasions, it now becomes his property.

NEW YORK.—The Leatherstocking Rifle Club, of Goshen, contested a match at their range on June 2d, which resulted in a victory for Mr. Booth, who led with a score of 61 out of a possible 70. Seven shots each at 200 and 500 yards. The following are the best scores:—

	200 yds.	500 yds.			200 yds.	500 yds.	
Name.			Total.	Name.			Total.
J. Booth	27	34	61	R. B. Hock	24	29	53
A. J. Moore	27	33	60	L. J. Perler	28	14	42
C. W. Coleman	29	29	58	W. Murray	20	19	39

Some of the scores at 500 yards were very fine, indeed, as the 500 yards range is a very poor one, it being up hill.

NEW JERSEY.—The opening festival of the Schuetzen Park at Union Hill, took place the 22d, 23rd, and 24th, of May, and was very well attended, shooters being present from almost all parts of the country, especially from Newark, New York, Philadelphia, Troy, etc. Capt. Aery, the President of the Board of Directors of the Schuetzen Park, distributed the prizes at five o'clock P. M., the third day. We give herewith a list of the ten first prize winners on each target:—

RING TARGET.

Name.	Rings.	Name.	Rings.
Aug. Ernisch	72	C. Koegel	59
H. Koegel	67	N. Cruisers	58
Wm. Hayes	65	J. Blumenberg	57
J. J. Morf	63	Phil. Klein	57
P. Meyer	60	John Raschen	57

MAN TARGET.

Name.	Lines.	Name.	Lines.
Phil. Klein	46	A. Zengner	40
Wm. Hayes	41	J. U. Nell	40
John Reis	42	A. Sertz	40
J. J. Morf	41	J. J. Rathjen	40
Capt. Raschen	41	J. Blumenberg	39

BULL'S-EYE TARGETS—4 INCH IN DIAMETER, MEASURED BY MACHINE.

Name.	Degrees.	Name.	Degrees.
J. J. Manz	324	N. Lewis	169½
J. Morf	59	Wm. Klein	121
J. U. Nell	61	J. J. Rathjen	125
Wm. Hayes	76½	Chas. Kruse	127
J. Burgmann	95	J. Blmenberg	136½

The most hull's-eyes (4 inches in diameter) were shot by J. J. Morff, of Jersey City, who made 60; Nelson Lewis, of Troy, following with 41.

At the team shooting, which took place Wednesday, the 24th, the following teams were contestants: One from New York, Schuetzen Corps; one from Jersey, Schuetzen Corps; Columbia Rifle Association, and Helvetia Rifle Club. Each team consisted of seven men, each man to fire ten shots at the Centennial ring target, (twenty-five half inch rings). The Helvetia Rifle Club came out first, winning a splendid gold medal; they made 1,091 rings. Next in rank, and also winning a gold medal, came the Newark Shooting Society, which scored 1,042; third in line was New Yorker Schuetzen Corps with 1,039; 4th, Columbia Rifle Association, 860, and 5th, Jersey Schuetzen Corps, with 830; the latter two societies say, that they will try to do better next time. Three hundred dollars worth of prizes were also distributed on the bowling alleys. Music and dance kept the company, the visitors and every body together up to a late hour.

Champion of the team was Wm. Hayes, of Newark, with 184, followed by J. Belcher, of Newark, with 183, and J. J. Morf, of the H. R. C., with 181.

MASSACHUSETTS.—A rifle club has been formed at Pittsfield, under the style of The Berkshire Rifle Association. The officers elected are Col. Walter Cutting, President; James M. Barker, Esq., Treasurer, and Dr. F. K. Paddock, Secretary. A fine piece of land has been selected for a range, and permanent targets will be erected thereon very shortly. The ground allows good ranges for targets from 100 yards to 1,000 yards distance.

CONNECTICUT.—On May 24th the riflemen of Connecticut met again for the second time at Willowbrook range to contest for a number of medals and badges. The weather was fine, and the marksmen enjoyed a pleasant day's sport. The shooting commenced at noon, and a couple of hours were devoted to pool shooting, at which 38 bull's-eyes were made. G. P. Babcock, of Manchester, and J. B. Rowe, of New Haven, scored the highest number of fives. Mr. J. E. Stetson won the first badge of the day at 200 yards, by a score of 31 out of a possible 35. In the mid-range match, 500 yards, Mr. Babcock won the badge, scoring 34 out of 35, which gives him the badge, having won it before by the same splendid score. Then followed the long range match, 800, 900, 1,000 yards, five shots each; won by J. Rowe, who scored 52 out of a possible 75. The other scores were: J. Stetson, 49; G. W. Yale, 46. Mr. Yale won the badge at the first meeting, and the ownership of the badge remains to be decided.

The military match at 200 yards, for the Centennial bronze medal, was won by T. S. Rust of Company I, Second Regiment; score 26 out of a possible 35. The silver Centennial medal for the best score at 600 yards was won by J. E. Stetson of Second Regiment, with a score of 26 out of 35.

ILLINOIS.—The members of the Chicago Rifle Club met for long range practice at South Park near that city on the 1st inst. The best scores made were as follows: 15 shots at each distance:—

Name.	800 Yds.	900 Yds.	1,000 Yds.	Total.
Gen. W. E. Strong	59	57	60	176
O. C. Blackner	55	50	41	146
Chas. Fuller	59	36	35	130
A. G. Alford	51	36	42	129
J. W. Roberts		40	39	79

This was really the first time the club had shot at the three long ranges. Mr. Alford was suffering from severe indisposition, or he would undoubtedly have made a better score, as the week before he made 25 out of a possible 30, at 800 yards, and 27 out of 30 at 900 yards.

LOUISIANA.—The Crescent City Rifle Club, of New Orleans, held their regular meeting on the 28th inst. Some of the best scores were as follows, all the matches being 15 shots, 500 yards off-hand:—

Dudley Selph, 64; Jules Piffaut, 55. 500 yards lying down: Dr. George Howe, 82; Wm. Peree, 65; A. D. Babbitt, 56. 1,000 yards: Dr. George Howe, 59; Col. John Glynn, Jr., 57; Dudley Selph, 50; L. B. Hollingworth, 44.

The above score of Dr. Howe at 500 yards (special) carton target, is particularly good, the charge being 100 grs. Hazard F.G., in the Orange Judd position.

MILWAUKEE, May 27th, 1876.

EDITOR FOREST AND STREAM:—

The third contest at 500 yards for the Broadhead field glass prize came off a few days ago. Bangs won by a score of 71 out of a possible 75:—

Name.	Total.	Name.	Total.
E. D. Bangs	71	J. Meun'er	66
E. Fielding	70	H. P. Yale	60
C. Turner	68		

The score now stands, Turner winner once; Bangs winner twice. The fifth contest at 200 yards off hand, for the Broadhead prize, came off yesterday. The following is the score: Fielding wins by a score of 43 out of possible 50:—

Name.	Total.	Name.	Total.
Fielding	43	John C. Wells	38
C. F. Hawley	42	H. P. Yale	35
J. Meunier	39	J. Ormsby	34
C. Turner	38	J. M. Arnold	32
F. W. Hawley	32		

After the competition for the prize, a few of the gentlemen went over to the 1,000 yards range, to try their luck. As no one of the party had shot at that distance to exceed three times, the following may be called a very good score:—

Name.	Total.	Name.	Total.
E. Fielding	45	C. Turner	34
J. M. Arnold	40	J. Ormsby	33
H. P. Yale	31		

WAU WAU.

Game Bag and Gun.

WOODCOCK.—Many correspondents wishing to be informed as to the action of the late Legislature upon the Woodcock question, we will state here that the proposed amendments did not pass. The law remains the same as last year, and sportsmen may shoot woodcock after July 3d with impunity—provided they have guns.

MASSACHUSETTS.—The Worcester Sportsmen's Club had a pigeon shoot at their grounds east of Lake Quinisigamond, on the 1st inst. The club prize was won by W. S. Perry, who killed 14 birds out of 15. The weather being dry and the pigeons lively, the general shooting was not as good as usual.

Salem, June 4th.—A flock of about twenty winter yellow legs were seen in the mill-pond branch this A. M.; this is rather late for them. Matters generally quiet.

TEAL.

THE CHAMPIONSHIP.—In the match shot at Philadelphia on the 6th inst. for the championship between Capt Bogardus and Dr. Talbot, the former was the winner. The score stood as follows: Single birds, fifty each, English rules. Bogardus scored 38, and Talbot 39. Doubles, fifteen pairs each. Bogardus scored 26, Talbot 15. Singles of twenty each, American rules, Bogardus 16, and Talbot 14. Bogardus' total 76, and Talbot's 68.

IOWA.—A pigeon match was shot at Council Bluffs on the 30th ult., between Col. Hoffmayer, J. W. Chapman, J. F. Oliver, and Robert Mullis. The match was at 10 birds each, 26 yards rise, 80 yards boundary, ground traps, 1¼ oz. shot. The following is the score: Robert Mullis, 9; J. W. Chapman, 7; J. T. Oliver, 8; Col. Hoffmayer, 8. There being a tie between Oliver and Hoffmayer, they proposed to shoot it off at 3 birds each, 31 yards rise, and Chapman was also admitted. The following is the score: Chapman, 3; Oliver, 2; Hoffmayer, 1. E. P. A. P.

—At St. Paul, Minn., on the 27th May, in the shooting match by the members of the sportsmen's club, 15 birds, 21 yards rise, Messrs. Baldwin and Zimmerman killed 14 birds each, with one bird each just outside the limit. In shooting off the tie at 3 birds, 26 yards rise, there was another tie, when the distance was increased to 31 yards, Baldwin killing 4 and Zimmermau 3.

WISCONSIN.—Mr. E. S. Patten, of La. Crosse, Wis., recently received a present of ten dozen wild pigeons from a friend in Michigan and very generously invited some gentlemen to assist him in disposing of them over the trap. The following are the scores made upon the occasion: 12 birds each, usual conditions of boundary, etc.:—

Name.	Total.	Name.	Total.
E. S. Patten	8	W. W. Crosby	6
J. C. Dane	9	E. A. Hatch	6
Harry Wass	11	Gus. Engel	7
Thos. Dunbar	5	J. J. Hogan	11
Thos. Hogan	9	D. A. McDonald	7

VIRGINIA.—A number of matches were shot at Richmond on the 29th inst., the first being between Messrs. A. B. Duesberry and John Beatty at fifteen birds each; the former won by a score of 11 to 8. Messrs. Harvey and Babcock then shot nine birds each, Mr. Harvey killing five birds to his opponents three. A club match was then shot, 8 birds each, with the following result:—

Name.	Total.	Name.	Total.
L. Harvey	3	J. Beatty	7
J. L. Schoolcraft	5	F. M. Sherry	6
A. G. Babcock	5	C. Epps	6
A. B. Duesberry	5		

TALLOW FOR GUN BARRELS.

NEW YORK, May 17th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of 11th inst., you advise "G. A. F.," West Meriden, Conn., to use good sewing machine oil or Belmontyle oil as a preventative against rust on guns. My experience may be of benefit to some person who is troubled as I have been, keeping a gun in a damp locality for months. I oiled my gun with every known article. After many experiments, I came to common beef tallow, where I rested on my swab and rag. Now my gun is easier cleaned after a day's sport, and I may say has not had a particle of rust on it in three years. I always carry a piece of flannel soaked in tallow to use in the hush during wet weather for wiping my gun and rubbing tallow into my boots or shoes, and if I expect to have much fording of streams to do carry with me a cap box filled with tallow. The same piece of tallow answers for boots, outside and inside of gun. The smutch from the inside of gun barrels improves the color of one's boots, and the rubbing of tallow on boots improves flannel for wiping the gun. Another advantage in constantly having tallow with one is, much chafing is avoided by keeping boots from getting soaked with water, and thereby stiffening the leather. I often shoot in tie shoes when I expect to wade in water, they are so easily emptied, but never am troubled with stiff leather. At first I dry in by stove heat all it is possible to do; repeated rubbings with the flannel keeps them soft. A year ago last autumn I rubbed my gun outside and inside with a tallow flannel and left it in the country, last summer. I was unable to shoot, but took out the gun from its case to see if any rust had accumulated. I was surprised to find none, as the house was without fire all winter, and damp. I returned the gun to its case; left it there last winter without renewing tin tallowing. This spring, in April, I was at my country house, the gun came in for its share of inspection. There was no rust on it. If any kind of oil will go as far as the tallowed flannel I have yet to discover it. WOLLAT.

MARYLAND STYLE.—The epicurean Nestor of the *Turf, Field and Farm* does not relish terrapin cooked after a recipe printed in our paper last week. That may be true enough, and the gastronomic reputation of our friend still suffer no damage. Men's tastes differ. It may be that the caviller enjoys the ingredients separately—the flour, the eggs, the cream, and the wine—very well, let him take them so, and eat his terrapin *au naturel*, with no condiments but its own juices. Perhaps he will be persuaded to reveal the secret by which terrapin are made fit for his own noble palate. We submit that it were more generous and reasonable to attempt to convert us than to *hang* us for heretical notions. Faith! our Nestor would have graced the old Inquisition, condemning without a hearing. No doubt had he lived in those days, he would have served up martyrs in Maryland style, instead of roasting them at the steak. Hear what the venerable sinner says:—

"Alas! our good friend and neighbor, the FOREST AND STREAM, has destroyed forever its gastronomic reputation. It has committed an outrage on the sacred bird of the Chesapeake—the diamond-back terrapin—by the publication of a recipe for its cooking which would make the late Col. Jack Thomas or Mother Temperly shiver with horror in their graves if they could read it. What fate should be awarded the rash barbarian who would dress a diamond-back terrapin with flour, eggs, cream and wine? Hanging would be too good for him."

—"Well, sare," said a Centennial restaurant keeper, shrugging his shoulders when a customer from Arkansas demurred to paying one dollar for a cup of coffee and a roll, "zo price he may luke large, zat I admete; but zen, sare, reflect zat you nafer hafe anozzer shance like zese for une hundret year."

IMPORTANT.—Care should be taken, in buying Fishing or Hunting Suits to get a genuine Holabird Suit, and not one of the worthless imitations which are being put on the market. The best is the cheapest.—Adv.

SCOTTISH ARCHERS.—A curious scene took place at the Archers' Hall on October 10th, 1818. A party of North American Indians, who were giving an entertainment at the theatre, were invited to come and display their skill in archery before the Royal Company. The performance began by the Treasurer and Secretary shooting before the Indians at a distance of 100 feet; the Treasurer hit the paper (four inches in diameter)at the second shot, much to the delight of the Indians, who, on trying this range, could make nothing of it. Their bows were too weak for the weight of the arrows; the range they were accustomed to was about twelve paces, and at this their practice was good, but not better than that of the Highlanders. The Indians were next presented with four Scotch arrows and two bow-strings each, and then succeeded in shooting fairly well at the 100 feet range. "Six of the members of the Royal Company took up the like number of Indians at butt-distance, and shot a few ends, during which the Indian opposed to the Secretary 'papered' with his first arrow, and manifested tokens of great joy upon the event, but was beaten by the Secretary's second arrow, which was a better 'paper.'"—*Illus. Sporting and Dramatic News.*

LONG DISTANCE WALKING SIXTY YEARS AGO.—A correspondent of the *Eastern Morning News*—an English paper—furnishes it with the following formidable list of performances of Josiah Eaton, ag. d 49: At Stowmarket, Suffolk, walked a quarter of a mile in every successive quarter of an hour for the space of six weeks; commenced at two o'clock on the 12th May, and finished five minutes before two o'clock on the 23d June, 1818, having previously performed the following pedestrian feats: December 26th, 1815, on Blackheath, 1,100 miles on the Barclay plan, viz., a mile every hour; July 20th, 1816, at the same place, 1,100 miles, commencing each mile within twenty minutes after each hour; December 5th, 1816, on Brixton Causeway, 1,998 half miles in 1,998 succeeding half hours; June 18th, 1817, on Wormwood Scrubs, 2,000 miles in 42 days; September 6th, 1817, from Colchester to London one day and returning to Colchester the next, being 51 miles daily for twenty successive days.

Sportsmen's Routes.

THE "FISHING LINE."

Brook Trout and Grayling Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

The waters of the Grand Traverse Region and the Michigan North Woods are unsurpassed, if equalled, in the great abundance and variety of fish contained.

Brook Trout abound in the streams, and the famous American Grayling is found only in these waters.

Brook Trout Season opens May 1st.
Grayling Season opens June 1st.
Black Bass, Pike, Pickerel, and Muscalonge are also found in large numbers in the many lakes and lakelets of this territory. The sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also on and after July 1st Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, Send to Forest and Stream office, or address J. H. PAGE, G. P. & T. A., may4 4m Grand Rapids, Mich.

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. When one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Marquette and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kenokasa, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, via the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEESE, AND BRANT SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, Gen. Supt., Chicago. W. H. STENNETT, Gen. Pass. Agt., Chicago. ap16

TO SPORTSMEN:

THE PENNSYLVANIA R. R. COMP'Y

Respectfully invite attention to the

Superior Facilities

afforded by their lines for reaching most of the TROTTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

The lines of

The Pennsylvania Railroad Company

also reach the best localities for

GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVO, BEDFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting.

Also, to

TUCKERTON, BEACH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

FLORIDA.

40 Acres—$50.

Out of 650,000 acres of United States and State lands ceded to the ATLANTIC, GULF & WEST INDIA TRANSIT RAILROAD, 40 acres can now be

Selected for $50.

In the centre of the orange region, adjacent to a road running daily trains from Fernandina, on the Atlantic Ocean to Cedar Keys, on the Gulf of Mexico, with the best HUNTING and FISHING in America, and almost free transportation given to each purchaser, these lands will be speedily bought up by actual settlers from all parts of the Union.

They compare favorably with THE BEST lands in the State, and are already surrounded by thrifty Northern and Western Settlers.

HURST'S

Stereoscopic Studies

OF

Natural History

FOR OBJECT TEACHING IN SCHOOLS

And

PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

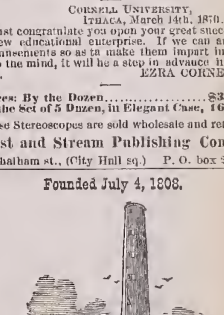
To these will be added a second series of foreign specimens, and various animals and birds in grotesque attitudes, never, however, violating their natural instincts.

We offer these views, not as pictures only, but as studies from nature. One of the great moving elements in our modern system of education is object teaching. The unerring fidelity of the stereoscope transfers the animals and birds from their natural habitat to the rooms of the student and the fireside of our homes, where they cannot fail to have a lasting impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen, with its appropriate rocks, woods, or water, and coloring from the originals.

CORNELL UNIVERSITY,
ITHACA, March 14th, 1876.

I must congratulate you upon your great success in this new educational enterprise. If we can arrange our amusements so as to make them impart instruction to the mind, it will be a step in advance in education. EZRA CORNELL.



Prices: By the Dozen.....$3 00
By the Set of 5 Dozen, in Elegant Case, 16 00

THE ORVIS REEL.

The Most Compact, Neatest, Cheapest, and Durable Reel in the Market.

NO 1.—This Reel is extra nickel-plated and finely finished. Is perforated to make it light, and keep it free from sand, also that the line may dry without removing it from the reel after use. Has a very perfect click. It is very light, very strong, and holds from 40 to 50 yards of line. It is more compact and less cumbersome than ordinary 20 yard reels. It is quite narrow, and takes up line rapidly. Put up in neat Black Walnut Case, price $5.

NO. 2—For Prizes. Same style as No. 1. Heavy Gold Plate. Extra finish, with case, price $10.

Sent by mail, postage prepaid, on receipt of price, or by express, C. O. D. LIBERAL DISCOUNT TO THE TRADE. Send for Price List of Fishing Rods and Reels. Mention this paper.

THE NEW

BOSTON

SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

W. H. HOLABIRD

Would most respectfully announce to his patrons and friends that he is prepared to make

Shooting and Fishing Suits

at the above prices. The ten dollar suit is better made than any competitor can offer for the same money. My original design having been appropriated by other manufacturers, I have been compelled to make many changes in the arrangement of pockets, &c., for which I have to thank the fraternity at large for suggestions. I believe that I have the

BEST SHOOTING AND FISHING COATS IN THE WORLD,

and respectfully solicit your orders. I send my new illustrated Catalogue, 16 pages, free on application.

Dealers will find it to their advantage to handle my goods. They are better known and more highly esteemed than any other make.

BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.

For Sportsmen.
A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.
A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.
Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by
J. H. Hubbard,

Liberal arrangements made with clubs and associations. Send for illustrated circular. HOMER FISHER, 260 Broadway, corner Warren St., N. Y. dec23 6m

Paper and Metallic Shells

FOR

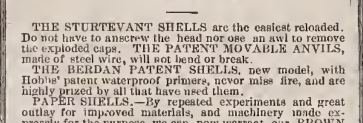
Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded cap. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.



THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2½ to 3½ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly.

CANADIAN ORNITHOLOGY.

"Our Birds of Prey."

BY

HENRY G. VENNOR, F. G. S.

THIS BEAUTIFUL AND NOVEL WORK contains 30 large Photographed Plates, and upwards of 150 pages of descriptive letter-press. It figures and describes every species of Eagle, Falcon, Hawk, Buzzard, and Owl that is known to occur or occasionally to have visited Canada.

No less than fifteen specifically distinct Falcons and Hawks, three Eagles, and ten Owls are described as inhabiting Canada, some of these, however, being given as "exceedingly rare."

The letter-press of the work is, throughout, based upon the Author's personal observations in the Canadian field between the years 1860 and 1876, and is filled with new and original facts relating to the distribution, habits, and indification of these Birds. It also contains the observations of recent American writers on several species concerning which there has been much controversy.

The whole form a series which it would be difficult to improve upon, and one that is not to be found represented in any one collection in the Dominion of Canada—many of the Birds figured having been sent from distant places on purpose for these plates. All are Canadian Specimens.

The copyright of the whole work has been secured for Canada and the United States by the Author, and only a small edition will at present be issued. This will be distributed in Canada, to Subscribers in the order in which their names occur on the Subscription Lists. Early orders are solicited.

Price Complete, in Cloth (30 Plates), - - $13

P. S.—The Plates of this Work will not be sold separately, but if desired the whole book may be had in paper cover, $12.

TESTIMONIALS.

From Hon. J. T. Headley, the Historian, Author of "Adirondack, or Life in the Woods," &c.

It is admirably written, and has just enough of humor, sentiment, and description of scenery mixed, to make it delightful. The illustrations are well chosen and very effective, while the instructions respecting routes, localities, distances, outfits, &c., embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—a compliment that I trust will be properly appreciated for its extraordinary disinterestedness.

From Albert B. Street, the Poet, and Author of "Woods and Waters," "The Indian Pass," &c.

I think it is the *best* work on the forest that has appeared—superior in word-painting to Murray's, and full of wood pictures and vivid scenes of camp-life. We realize that we are in the forest, are living with you in the scenes described, and that the trees are waving and the waters flowing over and by us. This, I think, the true test of a good book, impressing its reality and distinctive life on the mind. As a "Guide Book," it is most creditable and valuable. Indeed, it is the *only* thing of the kind that has yet been published—that very thing that has been so long wanted and waited for. It must have cost you intense application and labor. You may well be content that you have produced a good book.

From Benson J. Lossing, the Historian.

I have read those portions descriptive of the places which came under my personal observation, with the deepest interest, and most cheerfully testify to the general accuracy of your pictures as I recall impressions made of them at the dates of my visits. I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wonderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.

Sent by mail on receipt of price, $2.

CHAMPION GUNS OF ENGLAND.

PAPE'S

Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun.	Exhibitor.
1st—Greener	Greener.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards, Choke Bores.

1st—Pape ..... Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape ..... Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1¼ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold gripe now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.

FOREST AND STREAM

Terms, Five Dollars a Year. Ten Cents a Copy.

NEW YORK, THURSDAY, JUNE 15, 1876.

Volume 6, Number 19. 17 Chatham St. (City Hall Sqr.)

WHERE THE LADY'S-SLIPPER GROWS.

[Poem read at the Commencement of Cornell University, June 1876, before the Alumni. Advance sheets furnished to FOREST AND STREAM.]

CUNNING, dainty little shoe,
Filled with limped depths of dew,
Where the faery shallops float,
Coasting round the flower's throat,
Like the wild man's moccasin,
Of the fawa-deer's velvet skin,
Ronaded heel and stubby toes,
Thus the lady's-slipper grows.

Humming-birds fly down and quaff
Nectar from this pure carafe,
Liager long above its lip,
And its sweetened waters sip,
Glossy are their vests and green,
Yellow is the flower's sheen,
Green and gold the picture glows
Where the lady's-slipper grows.

Come, my friend, and leave the town,
Walls of red and dast of brown,
Heated hot with noon-day glare,
Dizzy with its toil and care—
Leave the busy marts of trade,
Seek the woods and fragrant shade
Of the sassafras and rose,
Where the lady's slipper grows.

This the way, I'll be the guide,
Up the mountain's laureled side,
Through the pines which overlean
Beaded plots of wintergreen.
By the woodchuck's crooked trail
To the low and hidden vale
Which great cushioned rocks inclose,
Where the lady's-slipper grows.

Blessed is each sprig and spray
Of the sombre woods to-day,
Blessed with an unction sweet
For the pilgrim at their feet.
Here the moss is moist with dew
All the livid day-time through,
And all things invite repose
Where the lady's-slipper grows.

Like as deep and azure eyes
Flicker glimpses of the skies—
Flicker, flicker drowsily
Through the green roof of the tree;
Morn may go and go the noon,
Come the owlet's eyric croon,
Yet we ever dream and doze
Where the lady's-slipper grows.

Half awake and half asleep
We can feel the shadows creep—
Shadows of each shrub and tree—
Up the hill's acclivity—
Here the grape-vine's bosky arch
Joins the pepperidge and larch,
Wreathing them in nuptial clothes,
Where the lady's-slipper grows.

Here the lazy, truant bee,
Yellow-breeched in luxury,
Stays and swoons, nor will he go,
Till the brazen sun be low.
Like the ghost of by-gone fret,
Which we mock and then forget,
Comes the call of distant crows,
Where the lady's-slipper grows.

Honeysuckles form a hedge
On the overhanging ledge,
Kissing us with fragrant lips—
And the pearly trickle drips,
As in some great water-clock,
From the fountains of the rock,
On whose caves the nine-bark blows,
And the lady's-slipper grows.

Friend, I would that life like this,
Free from care and avarice,
Free from traffic's rush and roar,
Might be ours forevermore.
Though the earth be bought and sold
For a paltry bit of gold,
Man to Mammon nothing owes
Where the lady's-slipper grows.

I am tired of striving long
With the avaricious throng,
Climbin[illegible] up by trampling down
Fulle mi[illegible]akers for renown—
Anxious [illegible]ful that my heart
Takes bene[illegible]ore the victor's part,
S[illegible] and was afte[illegible] ambition's throes,
[illegible]d wretch first [illegible]'s-slipper grows.

I am tired of sham and show,
Gilt above and dross below,
In the parlor, on the pave,
At the wedding and the grave.
I am grateful to have found
Rude and wild and virgin ground
Where there are no false-heart shows,
Where the lady's slipper grows.

Vanity of vanities
Are the courts and galleries
Where one has to bow and smile
Though his heart ache all the while—
But we find among the trees
Prettiest of poesies,
And forget life's painful prose
Where the lady's-slipper grows.

In the wicked world that is
Desert to this oasis,
Lives are ground into the dust.
Innocents there are who mast
Sell their souls to buy their bread,
And, like spectres of the dead,
Wan and wishful, not one knows
Where the lady's-slipper grows.

Knowing not that they would be
Wrapped in love and sympathy
Could the solace of this place
Bathe each worn and wasted face;
Ah, could they but realize
That within this paradise
All are friends and none are foes,
Where the lady's-slipper grows!

There's a tale the wild men tell,
Which I like surpassing well,
How that when one's footsteps halt
At the dim and peaceful vault,
When one's hands are heaviness,
And his lips are motionless,
When one dies his spirit goes
Where the lady's-slipper grows. FRANK CARPENTER.

Pig Sticking in Jamaica.

I WILL take advantage of a quiet hour to send you a short description of a day's sport in Jamaica which may be of interest to your readers, as that island is so very different from anything to be found in the North American continent, and yet is very easy of access from its shores. I have thrown open the Jalousies to gaze upon the astonishing flood of moonlight that is pouring down through the valleys in the mountain slopes at the rear of the house; and as I call to mind the cool, dewy, delicate fragrance of those same valleys as we rode through them about dawn-hour this morning, and turned from the fairy-like wealth of strange forms of vegetation around us, to gaze back over the plains bathed in misty heat-haze to the sapphire sea beyond, it strikes me forcibly that a life among such scenes, inlaid with an occasional trip to busy London, gay glittering Paris, or New York, which is a sort of mixture of both, with a strong national flavor to lend variety, ought, for any reasonable human being, to afford as pleasant a programme as need be desired. Bleak winter never invades these mountain paradises; no drear and dark Decembers put thoughts of *Euthanasia* into heads; the bodies belonging to which have alas increased too much in weight, and the nerves slackened too much in tension, to make ploughing through the furrows, or crashing through a bull-finch, anything but unmitigated torture.

The fiery heat which would scorch the plains below but for a huge *punkah* of Nature's own manufacture, which causes the land-breeze to swing one way, and the sea-breeze another, with a mild monotonous motion, is here tempered also by the elevation, and seldom, even at mid-day, compels any one in ordinary health to refrain from active exercise. Here too, every conceivable variety of herb, root, fruit, fern, flower, orchard, grain, or grass, can be made to sprout and flourish by the exercise of a little care and attention, while many of these grow in rich spontaneous abundance, and would defy your efforts if you attempted to exterminate them. The streams and seas abound in fish; the mountain mullet is one of the Jamaican delicacies enumerated by a former Governor—the Earl of Mulgrave, I think—as being of unapproachable excellence; the black coat and the ring-tail pigeon were the others. There was a fourth—but there has been a change since the earl's time, not perhaps indeed, for, as Artemus Ward remarked, "If you'll take notice, you'll always find a great deal of human nature in man," but certainly in word—so I shall leave the last luxury to be guessed at by those who do not know the tropics. Those who do will have little margin left for conjecture.

To return, however, to our excursion, our party, besides negro assistants—one of whom was a special crony of mine—consisted of my host, two sturdy young Englishmen who were acting as book-keepers—as they call them in Jamaica—on a neighboring sugar estate, and myself. I was heavily armed, having provided myself, in addition to a breech-loading shot gun, and a small, but serviceable rifle, with a formidable weapon which was as near an approach to a boar-spear as our skill and materials permitted Cesar Augustus, my afore mentioned crony, and myself to manufacture. The rest contented themselves with shot guns. We had some nondescript mongrels of dogs with us, the ugliest and [illegible]s of which belong to Cesar Augustus. We were mounted on strong ponies, Cesar Augustus having one of his own, and being provided in addition with two or three youngsters clad in shirts and fragmentary trousers in special attendance on himself to carry his gun or hold his pony. Cesar Augustus is one of those lucky negroes whom we have turned loose in a tropical paradise, and whom, in an absurdly unreasonable manner, we curse because they wont work. Why, indeed, should they work? Who works when he has all the desires he knows of abundantly gratified? Cesar Augustus is a country gentleman, he holds his property in fee-simple, or rather he simply pays no fee. When his provision ground is worn out he chooses another, and the feed of all the horses he could use would not be missed from the luxuriant pastures around him. He took us to hunt at his house, which certainly did not look inviting from the outside, but within was clean and comfortably furnished, and his bill of fare would have made many a mouth of the English middle-class water. For all this I don't suppose he works two full months out of the twelve, and there are hundreds upon hundreds like him in Jamaica. Long before lunch time, or breakfast time, as they call it in the tropics (between eleven and one o'clock), we were on the track of a pig, and eagerly did our mongrel pack proclaim the part they took in the proceedings. After a while we might have dispensed with their services altogether; for, not only did the ground become too broken to permit of our remaining on horseback, but the covert grew so thick that the track of the wild boar become distinctly visible, and e'er long, in order to follow, we had to crouch beneath over-lacing branches and tangled creepers. Our canine assistants, of course, soon left us far behind, but, after persistent efforts, and at the expense of torn skin and clothing, we succeeded in emerging into a comparatively open space—one of those curious blocked up sink-holes that abound in Jamaica, where some former stream, whose course has been changed by earthquake or hurricane, had been used to dive into the bowels of the earth—and in the immediate vicinity of which a fierce strife was now raging.

At the pool of a small cliff, festooned all over with vegetable draperies of every conceivable pattern, and among some broken boulders which had lain in the bed of the by-gone current, the wild hog had made his lair; and was now at bay, defending himself gallantly against the dogs, some of which had already suffered severely from rash attempts to pull him down. To have shot him, of course, would have been a matter of no great difficulty, but I was determined to flesh my maiden spear, and more by good luck than good management for my hand through want of practice was sadly unsteady, I succeeded in administering a neat *coup de grâce*, and the quarry was soon broken up with some attention to the rules of woodcraft. We then found our way to Cesar's cabin where we partook of the luncheon or breakfast I have already alluded to, and, in

the formation of which, the *piece du resistance* consisted of another wild hog, previously shot by Cesar, and cooked on a lofty bamboo gridiron in the smoke of a wood fire. I have seldom eaten more delicately flavored or more tender meat. We had also several sorts of succulent vegetables, light cassava cakes, and cooling fruit *ad libitum*. We had our own supplies of wine and spirits, though Cesar had plenty of excellent rum; and, if any body wants to tell me where to get a more enjoyable luncheon this side of Delmonico's, he may make himself sure of a patient hearing. We shot a variety of birds during the afternoon and made a special detour to a sort of *bayou* running through a mangrove swamp where I succeeded in drilling a hole through the head of an alligator, whose skin Cesar has promised to save for me.

Jamaica is only a few days distant from New York. There is no hotel accommodation to speak of, but for a sportsman who makes up his mind to rough it, there is a warm welcome from a hospitable people; while, should he have the good fortune to procure an introduction to a country gentleman or two, the amount of roughing he would have to undergo would be something equivalent to the crumpled rose leaf on the bed of the Sybarite.

I am now in Hayti, where the only shooting I have seen as yet, has been that of the Vice President and the commander in chief of the forces. If there is any sport more in your line to be found in the interior I will let you know.

DOUGLAS.

Port au Prince, May, 1876.

For Forest and Stream.

JOCK'S LAKE.

IN the year 1863 I was persuaded by a friend to form one of a party of five to visit the "North Woods" of New York for the first time. Repeated trips to that region, but never twice to the same point, have not diminished the pleasure I always experience in the memory of that occasion, and while the place we then visited has of late years been less frequented than many others, it may afford a few moments of gratification to some of the earlier friends of the North Woods if I shall recall to mind the locality we enjoyed so heartily.

It was somewhere among the late midnight hours of Sunday, July 19th, that my friend Benson and I shouldered our pack baskets, seized our handful of rods, and emerged from our boarding house in the "Salt City" and bravely wended our way to the near-at-hand railroad depot. We were soon at Utica, and in bed for the fractional night remaining. The other members of our party had already arrived, and were snugly ensconced for the night. In the early morning I was aroused by my friend and ordered to don the attire I had chosen for the woods, and to pack up and leave the clothing I had deemed essential to the journey thus far. When I was arrayed, I was dismayed at the altogether unpresentable appearance I had assumed. However, it was very early in the morning, and I was reassured by the nondescript appearance of the rest of the party, to whom I was speedily presented. Calling the roll, there were Ed. Benson, an old woodsman, and myself, a neophyte from Syracuse, Loomis, the Professor from a neighboring academy, and H. H. Thompson, our chief, then a clerk in the Treasury Department at Washington, and Johnson, a merchant, also from Washington. Horace, one of our guides, was already in the office of the hotel, silent and shy, but destined to blossom and unfold as we approached the familiar woods and streams, and to prove himself "guide, philosopher, and friend" indeed.

Two stout wagons were speedily loaded with ourselves and our luggage, and we drove off in the gray morning in high glee over the Deerfield hills northward. A few miles out of town, among the trees, in a wild, romantic sort of place, at a little half rustic inn, we stopped and breakfasted most heartily. The fun had begun. We were in capital spirits from that time onward. A long drive, passing through Ohio, Morehouseville, and other primitive but shrivelled germs of towns, at one of which we took our dinner of bread and milk and picked up another guide, who brought us finally to "Wilkinson's" (now Watkins'), the last solitary house—itself well into the woods—on West Canada Creek, thirty-six miles from Utica. We were as hungry as a long day's drive on a bread and milk dinner could make men, and I verily believe the trout supper which followed was the best eaten supper of the season. Here I first encountered the "punky," and learned the almost inestimable value of the "smudge." The punkies knew I was a stranger, I believe, for more than a million of them, according to the coolest estimate I could then make, attacked me, and in my confusion at the unexpected stings I was utterly powerless. I appealed to Benson in my distress. "You see that smudge," said he, pointing to a kettle standing before the door, containing a smouldering fire, which sent out clouds of smoke; "well," he added, laughing, "you just rush into that and stand there, and the punkies won't disturb you." "Horrors!" I replied, "must a man murder himself to save his life?" But the pressure from the invisible host was too great, and I plunged into the smoke and stood there with smarting and tearful eyes, and fearful forebodings of the coming two weeks' experience. In and out of that smoke I went in desperation. I thought of Mark Tapley, declared in my own mind that he never saw anything in all his experience half so "jolly," and resolved, like him, I would try to "come out strong!" So by and by I boldly turned my back on the protecting smudge and went forth to explore the region beyond the narrow limits of the smoky door yard, and walked out into a little seven by nine meadow on the bluff, below which runs West Canada Creek. The scene is magnificent. From the north, by a winding way, the stream comes down through the mountains on either side, roaring and foaming, and passing off to the southeast, still fretting with the rocks. Great boulders are in the bed of the stream, and great boulders from the banks and mountains of the same rock, covered with evergreen forests, stretch away into the distance. The grandeur and beauty of the scene entranced me. I was lost in delightful contemplation—but punkiest I finally surrendered, and went back to the torturing smudge to escape the worse torture I was suffering. It was horrible, and even Benson, old woodsman as he was, afterwards confessed to me it was the severest attack of punky that he ever experienced. Seven of us slept that night in the loft, in feather beds, and Wilkinson, as he took the household candle down stairs, bestowed his cheerful good night by promising to bring up a smudge if the punkies should be "very bad." But we slept.

The morning opened with heavy rain, which continued until noon. We sat and lounged in the wood house, smoked our pipes, and took our turns around the smudge pan. Fishing and hunting stories filled the hours. At noon the rain dwindled into a drizzle, and I went up a little stream near by and then and there caught my first trout.

Our original plan was to go up West Canada Creek, fifteen or twenty miles, to Stillwater, the entire distance to be traveled on foot, with heavy packs on our backs; but the rain had made the path difficult, and had raised the stream sufficiently to destroy all hope of taking fish for days to come. The council of war around the smudge decided to go to Jock's Lake (Transparent Lake on the maps), nine and a quarter miles distant, and north. That journey we accomplished during the afternoon, Wilkinson driving in with our luggage, and me walking. Riding was out of the question. The road was a mere track through a dense wilderness, over hills, down steep declivities, full of monstrous boulders, over and through streams almost deep and strong enough to sweep the horses and wagon away, through slough holes, over which we toiled five weary hours until we reached the little log hut erected for sporting parties, which stood on the west shore, and near the south end of the lake, most picturesquely situated in the midst of a partially grass-grown clearing, sloping down to the water's edge. It was not "the thing," of course, to live in the hut, but we stowed our luggage and slept there snug and dry, and lived quite miscellaneously outside. I have seen many a time since when I should have been glad of the little log hut, with its bed room, store room, dining room, parlor, and, upon occasion, kitchen, all in one. As seven of us lay side by side across one end of the single apartment, upon our bed of fragrant boughs, it was a snug fit, and woe to the man who gave no heed to the occasional command, "flop over."

The following morning found us all in good condition and spirits. Somebody was up and out early, and we had trout for breakfast. Then we began our explorations. Two boats were drawn from their hiding place and launched. The finest spring of water imaginable was found to be near camp, and the provisions were unpacked and found all right. The lake was declared to be a charming sheet of water; the weather was fine, and we were well into the woods, with our allotted time before us. What more but good fishing could be desired? That we speedily tried, and found to our satisfaction that trout averaging about three fourths of a pound each were easily taken not far from camp. And now that we have reached the beautiful lake with the homespun name, and again in memory refreshed by my journal written there, I go through the delightful experiences of our stay there, I am in doubt what to say and what to leave unsaid. There was the crystal lake fed mainly by springs beneath its surface, in general shape like a new moon, curving westward, with rocky shores, the forest dense and unbroken, and unmarred by the fires which have devastated some portions of the woods. There were speckled trout in abundance, although it required bait to bring them to basket, but they were fine fellows about three quarters of a pound each. Not to be forgotten were the rabbits that every evening played fantastic tricks near our camp, and occasionally went into our kettle rabbits, and came out dinner; and the spruce gum, the pursuit of which gave me a soubriquet, until the capture and care of a young rabbit made me the "lion tamer" of the "Numidian lion." I remember how Thompson, with keenest enjoyment, fussed about camp the two first days, and surprised us as we neared the shore at evening by flinging the stars and stripes out from the pole of our shanty and shouting as patriotically as a Government treasury clerk should do in those war times; and how on the day following, good naturedly choosing me as his companion, and Horace as our oarsman, he next made the grand tour of the lake. We had fine success in fishing, but of that day I shall longest remember the lunching. We went ashore at the head of the lake, and on a big moss covered rock at the water's edge, under two trees, extemporized a spread, a couch, and a smudge. In spite of the cigar I am smoking as I read my journal of that day, and write these lines, I can almost taste that lemonade and smell the fragrant forest as we ate and drank in the woods. The flavor of the cigars that followed it is even less difficult to recall, and the blissful nap which succeeded all was more delicious than the sweetest stolen summer sleep in a country church during a drowsy sermon. We had been told of a rock on the west shore as big as a house. We visited it. By means of a tree which had fallen against its side, I clambered to its top. It was about twenty feet high, and 30x15 feet on the top. The old fellow had a history, and had seen elemental fires, but he was mute and grand in our presence, and refused to be interviewed.

We fished in the lake, bathed in it, and made our morning toilet by its clear waters. We shot rabbits and fired at a target. We ate, drank, smoked, read many an odd tale out of the old pictorial book of fifty-two loose leaves, and slept. We did a thousand and one little things like these—simple enough all of them, and foolish and boyish enough many of them—hardly worth writing, but important to be done, which made our few days of life there delicious. Now and then an extra catch of trout, or a fearful thunder-storm, or a discussion as to whether we were all "drafted" men in the outer world, and whether a deputy marshal might not put in an appearance for our arrest as deserters, varied the monotony of good things we were enjoying. One dark, rainy night we were aroused from our slumbers by Benson in dripping rubber coat, jacklight in hand, pushing into the cabin, and Horace following him with a deer on his shoulders, the legs drawn about his neck like a fantastic necktie. They had been to the "fly" (I knew how to spell that word once), and after successfully floating up to and shooting a fine buck, had finally, through manifold difficulties, threaded their way through the woods in rain and darkness to camp again.

We were very much troubled by the gnats and mosquitoes on shore, but always found relief on the water, and of an evening frequently moored our boats out a few rods from shore, and smoked and told stories and exploded our wit in serenity and safety. The air was as pure as the water, and the temperature perfect.

Finally, one appointed day, Wilkinson drove in for us and took our diminished luggage. We gaily, and with vigorous step, marched the nine and a quarter miles back again to the "last house," spent the night, and at half past three o'clock the next morning drove away to Prospect, twenty-one miles, where we took the train and were in Utica at half past ten o'clock that forenoon. Our good clothes and dinner followed, and then we separated.

I ought not, perhaps, to add that "H. H. T." is now in New York, and an occasional correspondent of FOREST AND STREAM, nor that Benson is at Binghamton, N. Y., a busy man of affairs, but as genial a man and as ardent a sportsman as in 1863; but "what I have writ I have writ." Loomis I used occasionally to meet, but his brawny frame and kind, wise face have gone beyond my horizon somewhere in the wide world, and Johnson may, for aught I know, be still among his hardware in Washington, or, if the wheel of fortune has revolved once too often, he may be again sailing around the world in a merchant ship seeking his fortune. And I—I never forget the misery of my first night at Wilkinson's, nor the unbounded pleasure and profit of all the rest of my expedition to Jock's Lake.

February, 1876. A. J. N.

For Forest and Stream.

THE GAME OF SOUTHERN CALIFORNIA—BY ONE WHO LIVES THERE.

I HUNT: and in the hope that some among your many readers will like to read a line or so concerning the game and fish of Southern California, I'll try to write.

Here in the foot hills and lower lands we have quail, rabbits, hares, wild pigeons, doves, English and bastard snipe, black-tail deer, antelope, coyotes, wild cats, mountain lion, coons, foxes, badgers, many ground grey squirrels, and a few tree squirrels. On the marshes and lagunas are wild fowl, swans, gray, white, and a blackish-colored goose, mallards and canvas-back, lots of wild celery, red heads, gray ducks, blue-bills, sprig-tails, long-tails, widgeons, three kinds of teal, blue-wing, cinnamon, and green wing, the first named teal mighty scarce; *chuffladoxes*, gadwells, spoonbills, ice ducks, and several other varieties whose names are to me unknown. There are also brant, and on the coast many sea fowl. In the mountains are deer, California lions, cats, black, cinnamou, and grizzly bears, big horn sheep, goats, gray squirrels, pigeons, mountain quails, and rabbits, (may be I'll forget some of them on paper, but may I be pizened if I ever do in the woods. Los Angeles is a mighty civilized kind of a place, and there's a powerful sight of fishing to distract a man's attention).

We used to have many elk, but now, except a few in the Tulare country, they are used up. People live almost everywhere, and game generally has a hard time. Of course there are places, thank God! where things are better, and a man can get out of sight of somebody else's smoke, and out of hearing of strange rifles; but that ain't what I'm talking about just now. There's some antelope left. I saw a bunch of about seven hundred head on the *Libre* last fall. All our deer are black tail; of these there are brush deer, which depend mostly on hiding to keep out of the way, ranging generally to the foot hills in heavy brush, and the mountain deer, found on the mountain ranges, and these never known to hide. Both look alike, and although the distinction is generally made, I am by no means certain it is well founded, but rather incline to the opinion that they change their habits to suit the localities in which they range. There is, however, I think, a brush deer, although I am not certain I ever killed one.

On the Mojave we often kill the burro deer, black-tailed, but larger and of a stockier build than the deer first mentioned, legs thicker, and general appearance slightly resembling a jackass, from which circumstance it takes the name (burro is Spanish for jackass). This species of deer is quite numerous in some portions of Arizona. In the mountains we still hunt altogether; on the plains and large *mesas* sometimes we have a run with fox hounds or grey-hounds. I've always hunted with a muzzle-loader, not worth money to anybody but me; but since I've been in civilization I've got me a Remington sporting, 44 bore, and I'm going to sorter lay the old gun away, and I kinder hate it, too.

Well, good night. Oh! I'd like to forget it; there's slathers of trout in the mountain streams on the coast side slope. EL CAZADOR.

Los Angeles, May 27th, 1876.

FISHING AND SHOOTING IN ILLINOIS.

RECOLLECTIONS OF AN OLD SPORTSMAN—NO. 2.

WHEN your correspondent landed in Chicago, in 1839, it was an ill-built town of 4,500 inhabitants, with unpaved streets, and neither gas or water supply. West of Buffalo no railroads existed, and passengers and goods came up the lakes by steamers. So during the long winters we were shut up from the world by ice barriers, and the mail from New York struggled along for ten days through the woods of Ohio and the swamps of Michigan. There was hardly money enough in town to pay the postage on letters (about six times the present rates); we were poor, but we were jolly. Among other sources of pleasure which the old inhabitant fondly looks back upon, is the abundance of game and fish—now, alas! among departed joys. I have seen woodcocks and ducks in the sloughs, which lay about the corner of Walnash avenue and Madison street. I have killed prairie chickens on Twentieth street, and ducks on the south branch between Adams and Jackson streets. A friend of mine shot a lynx just behind Wm. B. Ogden's garden on Ontario street, and bounced a wolf out of the long grass on the prairie where Gate's large iron works are, in the west division of the city, which he killed. I think it was about 1841 that the great circular deer drive took place, when fifty horsemen, with as many dogs, made a surround of all the deer between Blue Island (now Washington Heights) and drove the whole herd, forty or fifty in number, into the then southern part of the city, perhaps about Twentieth street, then into the lake, where many were shot. Deer were then so numerous in Northern Illinois, that in one day's hunt, about 1842, in McHenry county, I saw at least fifty head, and my companion killed five—two at one shot—with a rifle. He got them in line and put a ball through both.

The country about the Calumet River, twelve miles south of Chicago, abounded with game. Ducks in the rivers and sloughs in immense numbers, plenty of grouse on the prairie, while the woods abounded with partridges, quails, and rabbits. In spring and fall the prairies were covered with plover and curlew, while the marshes and sloughs were full of snipe and woodcock. We had good shots and good dogs in those days also. I knew one of our sportsmen to drive in his buggy to Fox River in one day, forty miles, and kill one hundred grouse by the way, another of them kill eighteen out of twenty at he had

put up in the woods upon the Des Moines River. Not many are left of the jovial set who had their shanty in the Sag about 1841, and few of them are active enough to carry a gun. Old age or rheumatism has closed them in their clutch.

So also with fishing. Who would think that fish ever existed in that Stygian pool known as the Chicago River? Yet I have sat anchored in my boat at the forks of the river, and taken fine strings of black and rock bass and pickerel, while from the pier we often used to catch lake trout, and sometimes muskalonge. In 1840 the Calumet flowed through a dreary wilderness of marshes, with a few fishermen's huts at the mouth, and a tavern four miles up, where the stage road crossed the river, as its only habitations—but what fishing it had! My companion and I paddled our boat one day in October up from the mouth to the bridge, and killed 250 pounds of pickerel and bass with the rod. Now the place is called South Chicago, the river front is covered with packing boxes and lumber yards, and the land sells for $100 the front foot. About the same year we fished Crystal Lake, in McHenry county, a beautiful sheet of water that never before had a white man's boat upon it. Our sport was superb; we killed in one day 150 pounds of fine bass, besides some pickerel. That lake is now the centre of a village, has a border of ice-houses, and would probably be as promising a fishing place as the reservoir in Central Park.

In 1845 I passed a week fishing at the Sault St. Marie. The trout fishing then was almost equal to the Nepigon at present. But I tried it a few years ago, and whipped the rapids for three days in July without raising a fin. So it will be with the Nepigon in a few years, unless protection is given it.

For Forest and Stream.

MOUNTAIN LAKE, VIRGINIA.

I SEND you an account of a trip to Mountain Lake, in this State, which I trust will prove interesting to your readers. Our way thither, though somewhat toilsome, over the ridges, was enlivened by many pleasant sights and sounds. Many species of birds filled the forest with music, and their brilliant plumage contrasted pleasingly with the myriads of flowers that strew the mountain sides. The splendor of azalias and rhododendrons cannot be imagined by such as have not seen them. Nothing to surpass them was ever seen in the most ornate gardens of oriental lands, and it would occupy too much of your space to describe everything of interest we observed on our journey; but I must pause to mention a hybrid between the hooded merganser and the common mallard, observed with a flock of same ducks on Sinking Creek. From the summit of his rich blue green head streamed forth a magnificent pure white plume, which he wore as proudly as Murat ever did his, this contrasting splendidly with his bright orange bill; the rest of his body much like the mallard. I have seldom seen a more splendid bird, or one with a more princely air. Seventy years ago there was no lake here—merely a mountain gorge, some four hundred feet below the summit of Salt Knob, the highest point but one in the ancient Dominion of Virginia, four thousand five hundred feet above the level of the sea. Down this gorge trickled a stream; athwart the gorge, some three fourths of a mile below, was cast a huge mass of loosely-piled sand rock, beneath which the streamlet found its way, re-appearing below as the branch of Little Stony Creek. Hither came the owners of the half-wild cattle on the mountain ranges to salt their animals, and when, little by little, the outlet beneath the rocks became choked, and the water began to form a small pond above, it was known as the "salting pond," or "salt pond." The subterranean passage is now nearly or quite closed, and Mountain Lake is at present a beautiful eccentric sheet of water, some 1,500 yards long by 400 broad, and 75 feet deep in the deepest place. Bold hills of sweeping outline form its banks, covered with guarled and twisted chestnut, sombre hemlock, and graceful white pine. Masses of rhododendron sweep down to the water's edge all around, whose wealth of bloom is surpassingly splendid. I say again no man can conceive of it who has not seen it. Beneath the water still "stands the forest primeval;" as the boat glides over the crystal surface you seem to be sailing right into the tops of the trees. In this lake hitherto were no fish. Last winter twenty thousand fine trout and three thousand California salmon were placed therein, besides the land-locked salmon first deposited. The natives of the lake are millions of water lizards (tritons), more than millions of crawfish, many water beetles, erustacea, etc., and the whole surface is now bordered white with ephemera. Gravelly shoals where spring heads come in afford beautiful spawning ground, and I suspect those crawfish, and the salamanders, whose name is legion, (the multitude of them being astonishing) may eat up the said spawn as fast as one million of fish could deposit it. I hope not. If so, however, a dozen or two pairs of mill-pond chub (*Grystes nigricans*) will eat them up—at least the crawfish—in short order. The outlet of the lake now flows over the surface, and is protected by a fine screen. As I rowed round the lake I discovered a enormous mass tangled in some brush, which I took to be frog spawn, but found on inspection that each egg contained a salamander about half an inch long, which wriggled away in the liveliest manner when set at liberty, by opening his native cell. After tea, cigars were produced, and after some pleasant conversation with Mrs. Dupont and her son, we went to bed, hoping it would be clear by daylight, when the Doctor and I got up our horses and set out for the saw-mill on Little Stony, three and a half miles below. The boys went to the billiard room. The morning hour for trouting was passed; however, it became cloudy and cool, we concluded to try, and fished down the cataract three-fourths of a mile, some very pretty rapids. They were not much inclined to rise. I caught the trout on a red-bodied fly with canvas-back's feathers for wings. This cataract is a very beautiful sight; the water takes a leap of some ninety feet, and falls into a splendid pool below; but though we whipped this pool faithfully with both fly and bait, never a rise had we. Fishing down together about a mile, and throwing back the fingerlings, we took about twenty very pretty trout. Leaving the lake on our return at near five o'clock, with some threatening clouds debouching from the valley of Doe Creek, we arrived at home without mishap. On the banks of this Doe Creek dwelt the notorious Lucas family of murderers. Old Lucas sold ginger cakes beneath the gallows whereon his son was hanging, and was afterwards hanged thereon himself.

This old wretch first introduced the celebrated "Randall grass" to the notice of the farmers of Southwest Virginia. It is the meadow fescue (*Festuca protensis*). Although so possessed of the devil, old Ran seems to have been a man of some intelligence. I have no doubt these wretched people were lunatics, though lunacies of such a grade ought beyond question to be put to death when they commit murder. If any of your readers are inclined to visit Mountain Lake for trouting and shooting they need have no fear of the demons of Doe Creek. They are exterminated by the gallows long since. I believe there is no more delightful summer headquarters in the United States than this same Mountain Lake, in Giles county, Va.

E.

TROUT FISHING IN OHIO.

EDITOR FOREST AND STREAM:—

"Angling Recollections" in your number of May 18th, by "C. C.," brought to my mind a bit of experience which was mine when, some three years ago, I was a resident of one of the cities of the northwest. From my boyhood I have had an intense passion for my rod and gun, which of late years I have been obliged to curb somewhat, owing to circumstances which I need not mention here; but at times the longing becomes overpowering, and I am almost forced to get away to the woods or streams for a few days, and let the savage elements, said to linger in the nature of the most civilized of us, have full freedom and play for a time, ere I can settle myself contentedly down to the routine of my occupation. On such occasions one of my favorite resorts was a beautiful valley of some five miles in length and one in width lying between two lines of two bluffs, and through the lengths of which ran a fine brook which seldom ever failed to furnish me a handsome lining to my kreel of from ten to fifteen of the speckled beauties of from six to twelve ounces in weight during a morning's stroll along its banks. Several smaller streams made into the main ones from side valleys. Along its courses just before the door, down through the barn-yard and across the meadow and pasture land belonging to the friend with whom I always stopped when on my excursions, ran the largest of these, and after leaving the borders of his domain it stole through a thick covert for about forty rods to its entrance into the main stream. In all, the distance from the house to its mouth, in a straight line, was not over one hundred and fifty rods. I had come intending to spend an extra day, and had made up my mind to test some of these smaller streams, although I had been repeatedly told that it would be a sure waste of time, as nothing but a few fingerlings had been caught in them for years. But I could not be satisfied until I had experimented for myself; and so, at breakfast the first day I informed my friend and his assembled family that I proposed to test the brook before the door, that morning, from thence to its mouth. The only response I got was a hearty laugh, and when they saw that that was not enough to deter me, they urged that I should go up the stream, for there, they said, I might possibly get a few very small ones. But none of these things moved me from my purpose, and having arranged my tackle and shouldered my basket, (I had, previous to breakfast and while the dew was on, caught a box of grasshoppers for bait), I started out, the lady of the house calling out to me just as I was disappearing behind the barn, "I'll send the boys down with the team when they come in for dinner to help you bring home your trout." Ten rods below the barn I dropped my first "hopper" into an eddy, but it was bunglingly done, yet not altogether without effect, for I saw a swift form dart across the shallow at the edge of the pool, and I knew then that the stream was not entirely empty. Two or three more trials, and my first trophy was landed in the shape of a beautifully-colored fellow about six inches long. Splendid pools appeared at nearly every turn of the brook, and in an hour I was within ten rods of the borders of my friend's farm with seven beautiful trout in my basket, having lost three that rose to my hook. At the next turn of the brook a deep pool appeared, overhung by the roots and stumps of a heavy clump of alders, the tops of which had been cut away. I made a careful cast, sure that this must be the home of a chief of the finny tribes that inhabited the stream, suddenly there was a rush, my hook was seized and I struck, but alas! too hard, and the line parted at its union with the lasher, and the finest trout that ever rose to my cast in that valley was gone. I sat down upon the grass and sadly and slowly adjusted another snell. A moment before I was elated with my success, and was enjoying, in anticipation, the good joke I should have on my friends when I should return, and their astonishment at seeing the results of my morning's work. But now all this had vanished. Nothing now would console me for the loss of that fish. What *was* paled into nothingness before what might have been. I rose at last, and with that sort of hope-in-despair feeling that one sometimes has on such occasions, I dropped another fly on the pool. Slowly the water swelled about a foot away from the hook, and a broad, sparkling side was turned up to the surface, catching the sunlight for a moment, and as slowly again the water resumed its wonted smoothness. It was aggravating. It only made me realize more fully what I had lost. The thermometer of feeling sank lower than ever. Nothing that I could do would bring him to the surface again, and I was forced to move on. But while my feet tended down the stream my thoughts were back at that deep, still pool. I went down the stream to its mouth, and my efforts were rewarded with three more very fine additions to the treasures in my basket. As I came back I could not pass the scene of my disappointment without one more effort to retrieve my loss, so I once more dropped a large "hopper" temptingly above the haughty monarch who held sway down under that root. Glory! Up he came with a dash! I had him, and in a moment more he was floundering on the meadow grass. I held him up to the light. I said "he is the finest one ever caught in this brook." Just then the dinner bell rang. "Now, friends, will come my turn to laugh," thought I as I started for the house. Occasionally as I walked hurriedly along I touched the surface of the water with my hook, and before I reached the house three more were taken, swelling my number to fourteen in all, which nearly filled my kreel. I walked into the house without saying a word. The family were at dinner. I sat my basket down upon the kitchen floor. It was heavy, and they saw it. The lady asked what was in it. "Stones, probably," was my reply. "But I'm going to find out," said she, her womanish curiosity getting the better of her. You should have seen how quickly that table was abandoned by the eight or nine persons that surrounded it when she opened the lid of the basket, and held it up before them with my great prize lying bent over the rest at the top. My triumph was complete, and the rest of the time of that meal I was kept busy recounting the incidents of my morning's tramp. And, "Who would have believed it," was the oft repeated exclamation of those who had lived for years beside that brook without "dropping a line" to see if any of its finny beauties were at home. After dinner we weighed my prize. He turned the scales at precisely one pound and a half, and the ten largest ones weighed unitedly seven pounds and a half. The other four together weighed but fifteen ounces. In the afternoon I took thirteen more from the upper end of the brook, but none of them very large. Such was the result of my day's fishing where there were no trout.

SCOTT.

Columbus, Ohio, May 23d.

Fish Culture.

ABSTRACT OF THE TENTH ANNUAL REPORT OF THE FISH COMMISSIONERS OF THE STATE OF CONNECTICUT.

AS this year completes the first decade of labors for the restoration of fish to the depleted waters of the State, the Commissioners have deemed it a fitting occasion, before entering upon a detailed statement of the past year's work, to make a brief review of what has been accomplished from the beginning, under State patronage. It is believed that such a retrospect will be found instructive and valuable in shaping legislation for the future. With this view the Report before us contains a brief *resumé* of the operations of the Commissioners for each year since 1865. In 1867, the Commissioners of the New England States met in Boston, and organized as "The New England Commissioners of Inland Fisheries," to co-operate in the re-stocking of the Connecticut with salmon and shad, under the following arrangement: New Hampshire was to procure and distribute impregnated ova of salmon and shad in the headwaters of the river. Vermont and Massachusetts were to build suitable fishways for the passage of fish over the dams to their spawning grounds; and Connecticut was to abolish gill-nets, stake-nets, and pounds, in the river and on the Sound. From this it will be seen that three things were then considered essential to success; a supply of ova, a free passage over the dams, and the abolition of destructive methods of fishing.

The Connecticut Commissioners, Messrs. Frederick W. Russell and Henry C. Robinson, made the first annual report in May, 1867, and they recommended, among other things: 1st, that gill nets and stake nets be strictly prohibited after 1867; 2d, that the taking of salmon be prohibited for a certain number of years; and 3d, that Commissioners be appointed by the Governor, to hold office one or more years.

The Reports of subsequent years form an interesting history of the progress of fish culture. Experiments of various kinds were to be tried, prejudices to be overcome, and the people to be convinced of the practicability and utility of fish culture. In 1870 shad appeared in unusual abundance. "Such a run of shad in the river had not been seen for twenty years." On Sunday, the 22d of May, they appeared in the Sound, in immense shoals, near the surface of the water, making for the Connecticut river. On Monday morning over 28,000 shad of good size were taken from the pounds at or near Saybrook. The same day, at Lewis' pound, beyond Nanneetasket Point, 3,500 were taken at one time, being seventold the usual catch. At Haddam Island, 700 were taken at one haul of the seine. At Wethersfield, 900 were taken during the day. At Holyoke dam 450 were taken between four and five o'clock in the afternoon. At all the other fishing places on the Connecticut the catches were unusually large, and the fishing continued uncommonly good throughout the season. The average quality and size of the fish were also good.

Acting on the belief that this was the result of artificial hatching, the Commissioners continued their operations at Holyoke, and in seventeen days between June 20 and July 7, they hatched and turned into the river fifty-four millions of young fry.

During the same year a thorough inspection of the principal rivers of the State convinced the Commissioners of the possibility of introducing salmon, and ova from the Miramichi was procured and laid down in the hatching house at Pequonnock, to be afterwards distributed in the Quinebaug, the Housatonic, the Farmington, and the Shetucket rivers. The hatching of shad and salmon has continued down to the present year, together with the stocking of various ponds with black bass, all of which proceedings have heretofore been chronicled and described in these columns.

The report of the last, or tenth year's proceedings shows, first, that 159,000 of the fry of the land-locked salmon were procured from Sebec Lake, and distributed in quantities of about 10,000 each in fourteen ponds and lakes. Of 438,000 Penobscot salmon eggs laid down in the Westport hatching house the previous year, 310,000 were distributed, the principal lot of 30,000 going into the Farmington river at New Hartford. 480,000 California salmon eggs were received from the McCloud river, and those not lost were distributed, 50,000 in Natchaug river at North Windham, 110,000 in Housatonic river at New Milford, and 300,000 in Farmington river at New Hartford. There are now at the Westport hatching house, in good order, 420,000 young Penobscot salmon almost ready for distribution. The Commissioners give great credit to Mr. George Jelliffe, the efficient superintendent of the Westport hatching establishment, for the energy, fidelity, and great intelligence with which he has discharged his duties. No hatching of shad was attempted the past year owing to the State appropriation having been delayed beyond the time when it would have been necessary to have commenced, and when it was granted the season had passed. The Commissioners in reviewing their labors, claim that the results have been all that could have been expected. It is believed that no expense has been incurred which has not met with an equivalent return, or indeed much more. A store of practical information

has been gained that will be of incalculable value in future operations; doubts have been solved, and it has been demonstrated that salmon fry can be procured for restocking at a trifling cost; that shad can be spawned artificially as easy as other fish, and that ova and young fish can be transported thousands of miles without difficulty. The Commissioners believe that their operations with shad alone, have resulted in a grand success which pays the people annually ten fold all that it has cost.

With regard to the salmon the problem of restoration yet remains in many respects unsolved. It was believed at first that the planting of a few thousand fry, for three or four years in succession, would surely bring back the salmon. But this was a great mistake. The small quantity of fry planted was wholly inadequate to the purpose. This fact was not so clear to the Commissioners in the beginning; but gradually it became the conviction of all the New England Commissioners. It is only within the last three years that the experiment can be considered as fairly initiated and adequately continued, and it will be continued for two years longer, or until the experiment now fairly under way becomes a clearly defined failure or success.

The pound nets have caused the commissioners continual trouble. At the beginning of their work it was believed that they were very destructive to the river fisheries, and had it not been for the artificial hatchery at Holyoke the shad would probably have entirely disappeared. Now it is not unlikely that the immense number of fish hatched at Holyoke may obviate the necessity of abolishing the pounds, that is if they will submit to proper regulations. For the past two years both pounds and river nets have had good catches of shad, and so long as all fishing interests are profitable any interference on the part of the Commissioners would be impolitic and unjust. The pound men appeared in great force before the Legislature last year and procured a repeal of the act whereby the pounds were prohibited; and now there is little or no restraint imposed upon any fishermen except in limiting the season of fishing, regulating weekly close time, and limiting the size of the mesh of their nets. A law was also enacted last year providing for a report of all fish caught in the State. Many blanks for such returns have been called for, and it is hoped that when they are filled up and returned to the Commissioners, as the law provides, they will afford much valuable information in regard to the number and kind of food fishes caught in the waters of our State.

The fishway over Greenville dam was completed last spring, and an immense number of alewives, trout, black bass, eels, and other fish passed through it; but no shad were seen in it, although there were rumors that shad had been seen and caught above the dam.

Everything has been done by the Massachusetts Commissioners to make a perfect fishway at Holyoke. That shad can ascend its current has been demonstrated beyond a doubt; and where shad go the more vigorous salmon can easily push his way. The great trouble with the fishway was that the shad would not enter it, although the approaches to it seemed natural and easy. Commissioner Brackett altered the entrance last year, and shad were seen passing through it. Since the Report was printed the Fish Commissioners of Connecticut have ascertained that numbers of young salmon from four to six inches in length have been seen at the mouth of the Connecticut this season. They are on their way to the sea, being the product of those placed in the river two years ago. They will not return till 1878, when they will seek the spawning beds. The Commissioners are encouraged by the appearance of these grilse, and feel confident that their efforts to restock the river will be successful.

For Forest and Stream.

THE WHITEFISH INTEREST OF MICHIGAN.

IF the usual proportion of whitefish spawn comes to life, and the ova that will be hatched artificially be added, we shall realize an increase of fish so large that we shall catch as many next fall as used to be caught twenty or thirty years since. With regard to the Hatcheries here, one is in this city, put up by the Fish Commissioners of this State, and worked under the superintendence of Mr. O. M. Chase, of Caledonia Springs, with boxes made after the pattern used by our old friend Seth Green. Mr. Green's brother was up here to collect fish eggs last fall; he worked hard, got them in the house, and all things working well before he left, for which he deserves great credit. I am informed by the Secretary of the Michigan Fish Commission that they expect to hatch about eight millions. Some of them will be distributed throughout the State for the inland lakes, and a great many, I think a large proportion, will be put in Detroit River. There is a Hatchery put up by the Canadian Government one mile below Sandwich, near the bank of the river, which is a credit to Mr. L. Wilmot, the designer and superintendent. It is being worked under the superintendence of Mr. J. Nevin, a party sent there by Mr. Wilmot. From what I can learn equally as good success may be expected as at the Hatchery in this city. Those are intended for the Detroit River. We are at a great loss for running streams in this part of the country. The water used at the Detroit Hatchery is taken from the Water Works. One of the Water Works Board (Mr. C. Hurlbut) was at one time a catcher of fish on Stony Island. He has taken a great interest in fish propagation ever since it was first mooted in this country. The water used at the Canadian Hatchery is furnished by a small pumping engine, which gives a full supply. I have no doubt but that in a few years' time we will have as many whitefish in Detroit River as ever.

There is at Toledo, in the State of Ohio, a Hatchery—one of three put up by the Fish Commission of that State, which was very successful last season. The fish were put into the Maumee River, which at present has a strong current running that will take the young fish to the lake, where there is clear water. At first I had no expectation that whitefish could be successfully hatched in the waters of the Maumee River, but now I am satisfied they can be. Of the other Hatcheries belonging to Ohio, one is at Sandusky, and I think the other at Put-in-Bay on South Bass Island. What success has been attained I am unable to say.

With this I give you a small sketch of Detroit River and its fisheries, with the amount of last fall's catch, as near as I can from memory. I figure it at nearly 206,000. On Fighting Island are six fisheries which belong to me.

VERITAS.

IS SEINING PROFITABLE?—We are pleased to see the Gloucester papers beginning to ask this question. When the result of several years' experiment indicates to practical fishermen that which the scientific conservators of our fisheries have long maintained—namely, that our products of the sea and inland waters are being constantly diminished, and will in time be annihilated, by the use of the contrivances for the wholesale destruction of fish—we may take courage. Hope for the future revives. Our protective clubs may be encouraged to look for co-operation from those who depend upon the continued preservation of fish for a livelihood. One writer in the *Cape Ann Advertiser* has been brought to a realizing sense of the great error in the use of seines, and asks:—

"Suppose you annihilate the mode for five years, and return to the hook and line; would it not show that the latter method netted, on the average, the most money to vessels and crew? The big hauls with the seine intoxicate, like the chief prize in a lottery, and we are apt to overlook the slow gains, that come little by little, and are in reality the only method to success in the end. Of the large number of vessels engaged in seining, how many have made money for their owners? Let us hear their experience."

BLACK BASS SPAWNERS.—Black bass weighing from three to six pounds each, are too large for stocking open streams, they being liable to wander, while the small ones are more likely to remain near where placed. These small fish commence propagating in July, and continue into the month of August. The more adult fish commence propagation as early as May, and continue through the month of June.

BLACK BASS IN THE CONNECTICUT.

HIGGANUM, June 9th, 1876.

EDITOR FOREST AND STREAM:—

About a dozen black bass were caught here last week. They were taken a few rods up in a cove which runs to the river. They are the first ever seen there, and I think it is a settled fact that we soon shall have plenty of these gamey fish along our river. They weighed from three quarters to four pounds. There is a cotton mill at the foot of the falls where the brooks empty into the cove, and it was there among the rocks, and along the pebbly bottom, also where they have free access to and from the river, that they were caught. I caught one with a gray fly, at my second or third cast, and no donbt would have taken more if they had not been frightened by the mill boys, who were there in full force, some catching them in their hands after driving them into holes worn into the rocks by the constant action of the water. One boy caught one in this way which weighed four pounds. Do they come there to spawn or to feed? They seem to be there all the day, as they can be seen from the mill windows. C. O. GLADWIN.

The fish gather around the rocks so as to rub off the parasites which have been tormenting them for a long time, and to put themselves into proper condition for the angler's use. It is on account of this habit that by casting near a stone pile, one is pretty sure of catching fish. In preparing ponds for stocking with bass, piles of stones should always be thrown in.

SALMON IN THE CONNECTICUT.

HIGGANUM, Ct., June 5th, 1876.

EDITOR FOREST AND STREAM:—

I inclose you an article clipped from Hartford *Post* June 2d, thinking that perhaps otherwise it would not come to your notice:—

"SALMON CATCH.—Robert G. Pike, Esq., Fish Commissioner, received a letter Thursday, from Saybrook, which informed him that on Tuesday last fifteen salmon were caught near Lynne in the folds of the fishermen's nets as they were hauling ashore. They (the salmon) measured from six to eight inches in length, and were doubtless of the hatching of 1874, and were on their way to the sea. A specimen salmon has been sent to Mr. Pike. The Fish Commission is doing a good work for the public."

I think the fact contained in it is important, and if the fish taken are really young salmon it is another hopeful sign that, with proper help from man, this noble fish will again make this beautiful Connecticut River their home, as it was fifty years ago. If you know of any reasons why, with a good fishway over the dam at Holyoke, salmon cannot be made to inhabit this clear water, we would like to hear them. We have some men here who claim that stocking the river with salmon is all humbug, and cannot be done, one prominent man in particular, an ex-State Senator, saying that he don't believe a word of the article from the *Post*, and that it is gotten up merely in the interest of the Fish Commissioners, they wanting another appropriation from the Legislature of $5,000. One of our fishermen here caught last Friday, 2d, what is called by some of our oldest fishermen, a young salmon, while others (old fishermen also) say it is not, and there is quite a dispute going on about it. Will you please give us a description of a young salmon, say about six inches long? I think it will settle some of their disputes. I hope to see it a few years, not only young, but old salmon, taken from our river, and I for one shall be glad to meet any lovers of the rod, and share our sport with them in The Rise, The Struggle, and Landed of the salmon.

C. O. G.

[Six-inch salmon, or parr, are easily mistaken for trout, being marked latterally by a line of deep scarlet spots, seven in number. They lack the blue and silver spots, and the dark olive pattern on the back peculiar to trout. Besides, their scales are as large as pig-heads, and rub off easily when handled, adhering to the hand.—ED.]

DEE SIDE, Matapedia, N. B., May 29th, 1876.

EDITOR FOREST AND STREAM:—

Will some of your savans give us their ideas of the use of the hook or protoberance which grows so rapidly on the upper jaw of the male salmon? I have seen it on large males three inches long. When they first come from salt water you can only judge the sex by the length of head—"no hill or hook" to be seen. That they don't use it for nest making is certain; the male don't work at that; he lays off watching the performance, and will chase trout, or a smaller male. I never saw a fight between males. One always seemed to run when the other charged. The hill also prevents the teeth from touching, and a male at spawning time is not shut his mouth by an inch or two. JOHN.

This singular appendage, which is an ugly deformity, appears in the spawning season, and increases in size as the period of copulation approaches, and is then used by the male to grasp the female just above the shoulders on the back of the neck. The same peculiarity of habit attaches to various kinds of animals and fowls. The salmon is not the only creature that has a distinguishing mark when it reaches ripe maturity.

Natural History.

[This Department is under the charge of a competent Naturalist, indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

—A correspondent writes us a letter from "Springfield" which we would be glad to use if we knew the name of the State.

—Every reader who goes to Philadelphia should endeavor to secure copies of the circulars issued by the Smithsonian Department. Particularly those series marked B & C, which contain valuable lists of the animals of this continent.

—The Acclimatization Society of Paris has just received two Secretary birds from the Cape of Good Hope. A long feather projecting from behind the ear gives the appearance of a scrivener, and hence its name. In the country from which they are brought they are still called Serpent Killer, on account of the perpetual war which they wage against such reptiles. They have a slow and majestic gait, a curved beak of great power, and the body of a vulture with long talons.

NOTES FROM OUR CORRESPONDENTS.—"Teal" (Salem, Mass.) records within a week the death of a robin and a woodcock by flying against telegraph wires; also the death of a song-sparrow which was hit by a locomotive. He mentions his knowledge of several other occurrences.... Prof. W. H. B. Thomas (Mt. Holly, N. J.,) tells us that the southern limit of the rhododendrous is at Florence Heights near Burlington, N. J....Dr. Abbott, of Trenton, N. J., informs us that the "rusty-headed fisher" which we expressed our inability to identify a few weeks ago, is probably the southern name of the female gooseander....J. Murray (New York) writes us that last fall in the Adirondacks, his companion shot a dry doe in fine condition, in whose body was found a stick nearly seven inches long, very hard, with one end against the lungs and the other embedded in the heart-case. It had entered under the foreleg, and was probably received in jumping on a dead branch. ....Dr. Estes recently captured, not far from Lake City, Minn., a pure white pocket gopher (*Geomys bursarius*), which makes a very pretty pet.

WARBLERS OF THE WESTERN RESERVE.

I HAVE been very much interested in your natural history notes from different parts of the country, and take the liberty of adding my mite to the general fund of knowledge which must result from this extensive comparing of notes. Having been particularly interested in the warblers, I give below the results of my observation of them in this locality:—

Mincotilta varia. Black-and-white creeper. Common during migrations, arriving about May 1st.

Parula americana. Blue yellow-back. An abundant migrant.

Helmitherus vermivorus. Worm-eating warbler. Very rare. Shot two May 2d, 1873, which are the only specimens which have been procured near here for years; found them in deep, damp woods.

Helminthophaga pinus. Blue-winged yellow warbler. Rare; procured my only specimen May 22d, 1875.

H. chrysoptera. Golden-winged warbler. Rare; shot a female this year on May 11th.

H. rufficapilla. Nashville warbler. Rather common in some localities, though irregularly so; arrives first week in May.

H. celata. Orange-crowned warbler. Very rare; my only specimen was obtained on May 16th, 1876. A female was shot near here about the same time.

Dendraca æstiva. Yellow warbler. A common summer resident; arriving the first week in May.

D. virens. Black-throated green warbler. Abundant during migrations; have taken it from May 4th to 24th.

D. cærulescens. Black-throated blue warbler. Common after the first week in May. Having seen them in June, I think a small number may breed here.

D. cærulea. Blue warbler. Somewhat common the last two or three seasons; arrive about May 5th. Some of them probably breed here, as I have taken the male in the middle of June.

D. coronata. Yellow-rumped warbler. Common spring and autumn visitor; have taken them from April 20th to to May 14th.

D. Blackburnia. Blackburnian warbler. Abundant in spring; arrive second week in May.

D. striata. Black-polled warbler. The last of the warblers to arrive, never having taken it earlier than May 24th. I never saw many specimens.

D. castanea. Bay-breasted warbler. Not very abundant, although on May 23d, 1876, I procured two males and three females. May 15th is the earliest arrival recorded in my book.

D. pennsylvanica Chestnut-sided warbler. Common in spring, arriving about May 10th.

D. maculosa. Black-and-yellow warbler. Abundant during migrations. Have taken it from May 5th to 22d.

D. dominica. Yellow-throated warbler. One of the earliest to arrive; have shot them on April 20th. I am convinced that a few breed here, as I have seen them as late as June. I have only found them in two pieces of woods on the river bottom, though I have made special search for them elsewhere. They are as much of a creeper in habit as the black-and-white. All that I have shot have been of the variety *albilora*. I may succeed in finding their nest this season, though I have been unsuccessful so far.

D. palmarum. Yellow red-poll. Not very common. It arrives the first week in May.

D. pinus. Pine-creeping warbler. Abundant, especially in the fall migrations.

Perissoglossa tigrina. Cape May warbler. Rather rare, though in the spring of 1872 (April 30th to May 5th) a number of specimens were shot. On May 20th, this year, I was fortunate enough to secure a fine female.

Sciurus aurocapillus. Golden-crowned thrush. A common summer resident.

S. noveboracensis. Small-billed thrush. Not common.

Oporornis agilis. Connecticut warbler. Very rare. Shot my only specimen, a fine full-plumaged male, on May 27th, 1875. A female was shot in the same place only a day or two before.

Geothlypis trichas. Maryland yellow-throat. An abundant resident.

G. philadelphia. Mourning warbler. Rare; saw five last season, four of which I secured. This season I shot a male and female on May 20th, showing that they arrive late.

Icteria virens. Chat. The chats have been quite common the last two seasons, though more often heard than seen.

Myiodioctes mitratus. Hooded warbler. Not common. During this season and in 1874, I did not see one. On May 8th, 1875, I saw at least a dozen males.

M. pusillus. Wilson's black-cap. Rather common in some localities; arrives about the second week in May.

M. canadensis. Canada fly-catching warbler. Tolerably common, arriving about the third week in May.

Setophaga ruticilla. Redstart. Very abundant summer resident.

Several others have been shot here, but I have never been fortunate enough to see one of them. Soon or later they *must* join their kindred in my collection. I refer to the prothonotary, Tennessee, Kentucky, and Kirtland's warblers. I never heard of the prairie warbler being found here. H. ERNST.

Cleveland, Ohio.

NATURAL HISTORY OF NOVA SCOTIA.—Dr. J. Bernard Gilpin, who has long been a prominent member of the Nova Scotian Institute, in whose transactions he has published many papers, has recently added two more. One is on the serpents of Nova Scotia; the list including the garter snake (*Eutainia sirtalis*), the black snake (*Bascanion strictor*), the green snake (*Chlorosoma vernalis*), the king snake (*Diadolphis punctatus*), and the red-bellied snake (*Storeria occipitomaculata*). Dr. Gilpin enlarges in the most entertaining and valuable manner upon the habits of each species. The black snake is exceedingly rare, but all the species mentioned breed there, depositing their eggs under stones where they are left to hatch some time after. Dr. Gilpin regards the fact of snakes receiving their numerous young into their stomachs for refuge as perfectly well established, and, alluding to the fact that the dog-fish and other fishes do so, adds: "Future observers will be rewarded by witnessing our salamanders as well as our snakes watching over their chaplet of leathery eggs, feeding their young, and both protecting and coaching them by their own bodies."

A second paper by Dr. Gilpin is on the smaller cetaceans inhabiting the shores of Nova Scotia. He makes out five species: The dolphin (*Delphinus delphis*), the sea porpoise or cow fish (*Lagenorhynchus leucopleurus*), the common porpoise or puffing pig (*Phocæna americana*), the white whale (*Delphinapterus catodon*), and the bottle-nose or black-fish (*Globicephalus intermedius*). Detailed accounts of the habits and characteristics of each of these is given, except of the white whale—to be distinguished from the arctic narwhal (*Monoceros monodon*)—which is only a straggler to Nova Scotia. To the history of the porpoises is added an interesting narrative of the dextrous way in which the Indians hunt and secure them. These pamphlets may probably be procured for half a dollar from the author at Digby, N. S., and would well repay the reader.

SPRING AT MEACHAM LAKE.

MEACHAM LAKE, N. Y., May 22d, 1876.

EDITOR FOREST AND STREAM:—

In answer to your inquiry in regard to the arrival of the birds in different localities, I send you a few notes from my book:—

March 15th.—Saw two sheldrakes (*Mergus merganser*) in the open waters about the mouth of the inlet.

April 10th.—Three wild geese and black ducks (*Anas obscura*) and five blue herons in the outlet.

April 12th.—One bittern (*Ardea exilis*), one rail, hooded sheldrakes, and a single goose in the outlet.

April 15th.—Ducks plenty in the outlet and inlet, which are free from ice.

April 20th-22d.—Blue-birds, ground sparrows, robins, cow bunting, kingfisher, fox-colored sparrow, and golden-winged woodpecker. Cliff swallows skimming along the ice and catching "sap flies."

April 24th.—The hermit thrush gave us his first song this morning, and it almost makes me think that spring has come, but as I look out on the lake with its two feet of solid ice, I am reminded that it is still winter, with very good sleighing to the first neighbors, five miles, though we have no snow about the house.

May 1st.—Our greatest fall of snow for the winter, twenty inches. All the little birds are seeking shelter in the barns. Now my stock of plantain seeds come in play. I clear the snow from a spot in front of the house, throw the seeds out, and count thirty birds at one time picking up the seeds—snow birds, fox-colored and other sparrows, hermit thrushes, and snow buntings.

May 2d.—Fish hawks and gulls. Pigeons flying in all directions, and the partridges drumming.

May 5th.—The snow of the first has left us, and with it nearly all of the old snow. Going up the east shore to the boat I saw two deers; they looked as round and plump as in the fall.

May 10th.—Caught our first trout in the open water at the head of the lake. Saw the first kingbird and barn swallows.

May 16th.—The lake is clear of ice; this is the latest I ever knew it to hold. A. R. FULLER.

PRAIRIE ORNITHOLOGY.

PEOTONE, Ill., May 16th, 1876.

EDITOR FOREST AND STREAM:—

I wish to add a few birds to the list I sent you a short time ago. The yellow warbler is common here all summer and breeds. So also are the blue-birds, redstart, ground sparrows (*Poocetes gramineus?*) and Baltimore oriole. The scarlet tanager is not very common. I have seen as yet only one bobolink, but think they breed here. I have seen but one mud hen. Our list of birds is limited, as we have no woods or groves and nearly all the birds are such as nest on the ground. A pair of robins have built a nest in my yard in a small evergreen tree close to the walk. I watched them building it. One, I supposed the female, would come with a straw in her beak, and instead of going directly to the nest, would alight on a tree near by, when, after seeing that the coast was clear, she would fly to the tree and deposit the straw in its proper place. Then she would sit in the nest, and turning round and round mould it with her breast into the proper shape. Once she came with a bit of mud in her beak, and flew directly to the nest, but just before getting to it she saw a little girl standing in the walk, and immediately flew to another tree, where she waited till the girl was out of sight.

May I ask some or your correspondents to write to me on the subject of ornithology, especially those in the west, as I am very anxious to obtain specimens of western birds' eggs, particularly those of the different quails in California? D. H. EATON.

RECENT ARRIVALS AT THE CENTRAL PARK MENAGERIE.—One chati (*Felis mitis*), habitat Central America; presented by Mr. J. Dorand. Two leopards (*Felis leopardus*). Two Florida quails (*Ortyx virginianus*); presented by Dr. D. W. Williamson. One salt water terrapin (*Emys palustris*); presented by Mr. G. L. Tiemeyer. Received in exchange: Three Carolina parrots (*Conurus carolinensis*); two red-breasted grosbeaks (*Hedymeles ludovicianus*); one starling (*Sturnus vulgaris*); two skylarks (*Alauda arvensis*); two woodlarks (*Alauda arborea*); six Java sparrows (*Padda oryzivora*). The last four are natives of Europe. W. A. CONKLIN, Directnr.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Thirteen horned toads (*Phrynosoma cornuta*); presented by Chas. Noble, Philadelphia. Eleven prairie dogs (*Cynomys ludovicianus*); born in the Garden. One golden-naped amazon (*Chrysotis auripalliata*); presented by Willie W. Walker, Philadelphia. One wild cat (*Lynx rufus*); purchased. One loggerhead turtle (*Chelonia caretta*); presented by Jerry Nolan, Philadelphia, and three otters, presented by John Fletcher, Philadelphia. Two screech owls (*Scops asio*); presented by M. C. Taylor, Tooghkenaman, Pa. ARTHUR E. BROWN, Gen. Supt.

Sea and River Fishing.

FISH IN SEASON IN JUNE.

Trout, *Salmo fontinalis.*
Salmon, *Salmo salar.*
Salmon Trout, *Salmo confinis.*
Black Bass, *Micropterus nigricans.*
Shad, *Alosa.*
Land-locked Salmon, *Salmo Gloveri.*
Grayling, *Thymallus tricolor.*

For list of seasonable flies for June see our issue of June 8th.

FISH IN MARKET.—An abundance of fish of almost every variety known to our waters ornament the slabs of our dealers, and prices are such as to bring even the delicacies within the reach of all. We quote: Striped bass from 18 to 25c. per pound, according to the size of the fish; blue-fish, 8c.; salmon, 30c.; mackerel, 20c. each; shad, Connecticut River, 60c. each; weak-fish, 10c. per pound; white perch, 15c.; Spanish mackerel, 25c.; green turtle, 12½c.; terrapin, $12 per dozen; halibut, 15c.; haddock, 8c.; king fish, 25c.; cod-fish, 8c.; black-fish, 10 to 15c.; flounders, 8c.; porgies, 10c.; sea bass, 15c.; eels, 12 to 18c.; lobsters, 10c.; sheepshead, 15c.; soft clams, 60c. per 100; white-fish, 15c. per pound; salmon trout, 20c.; brook trout, $1.; hard shell crabs $4 per 100; soft do., $1 per dozen; frog's legs, 50c. per pound.

—The close season for brook trout terminates by law in Connecticut on June 15th.

—Weak fishing has been very fine in the Great South Bay opposite Fire Island during the past week. The favorite mode of catching them is with rod and reel from a boat drifting in the channels. A light blue fish squid kept just clear of the bottom being used. The fish run about six-pounds in weight. Some excellent catches of sea bass have also been made near Fire Island. On Saturday last Mr. E. R. Wilbur and a friend took took fifty-one in a little over an hour, the fish ranging as high as two pounds in weight. The blue fish are now in the South Bay, but none have been taken "chumming" as yet. The boats are having fair sport trolling outside the bar.

Blue-fish have been abundant in the Lower Bay, off Sandy Hook, for the past ten days, and crowds of small craft have engaged in trolling with good success.

—The shad season is nearly over on the Connecticut River, the present run being very thin; they are retailed on the carts at ten cents a pound.

—Sea bass are biting briskly at Stoney Creek, and at other places on Long Island Sound.

—A correspondent writes to tell us that he has used fish roe as a bait, with a few threads from a woolen tippet wound around it to secure it to the hook; has caught both salt and fresh water fish in this way, including speckled trout, and seldom missed a bite. He says:—

"I used to keep all the spare roe, and used about equal parts of salt and saltpetre to preserve it; put them in bottles corked (air tight), and kept in a cool place. I own I was not so successful with the preserved roe as the fresh, but if the fish were hungry it made little difference. I have kept roe for a year."

—Our correspondent, S. C. C., killed 1,000 pounds of fish to his own rod in 38 days, last spring, at Mosquito Inlet, Florida, comprising sheepshead, red bass, salt water trout, whiting, blackfish, gruuts, scup, groupers, rock groupers, cavalli, snappers, drum, bezugas, pigfish, catfish, sharks, and rays. Besides these common species, are occasionally taken specimens of more southern and tropical forms, which variety adds much to the interest of a day's sport in these waters.

—A Washington correspondent doesn't hanker after Potomac River bass. He says:—

"Last year I caught a great many, and nearly every second fish I got had a worm sticking out either close by the dorsal fin or just by the tail, and I have cut the fish and traced the worm nearly to the back of the head. This worm was a bluish green. One bass I caught with no appearance of worm outside, but being shy of eating them after seeing those worms I split him up the back and found the remains of one about the thickness of a match, as red as a piece of meat, and quite hard. Since then I cannot say I relish bass."

FISH OF RUSSIA.—The fish fauna of Russia, which comprises the cray fish, lamprirey, eels, perch, roach, pike, tench, chub, bream, dace, trout, grayling, and all the common kinds met with in England, includes many others unknown in British waters, such as the sturgeon, ide, pike perch, silurus glanus, Salmo hucho, S. spurius, S. autumnalis, and S. spectabilis.

—The French fishermen finding the supply of the roe of the American codfish, which they use as bait in their sardine fisheries, inadequate to meet their demand, have discovered that grasshoppers pounded into a paste can be made to so closely resemble the roe as to deceive the most intelligent sardine. The French Government has therefore begun the importation of grasshoppers from Algeria on a large scale, with a view to giving the experiment a thorough test.—*American Grocer.*

Now comes the glorious opportunity for the impoverished dwellers in the Far West to make money out of the invading hosts that have foraged upon their country. Let them gather grasshoppers by the ton, pound them to a paste, and ship them to France.

FISHING MOVEMENTS.—The number of fishing arrivals at this port, the past week, has been 57, viz; 13 from the Grand Banks, 4 from Western Banks, 37 from Georges, 1 from Fortune Bay, N. F., and 2 from southern mackereling trips. The Georgesmen are meeting with poor success, and were the mackerel fishery more promising the fleet would be greatly diminished; but as yet, mackerel have not put in an apearsance in any quantities, and the one branch is not more lucrative than the other. The receipts of fish for the week have been 488,000 pounds of cod-fish from Georges; 260,000 do. from Western and Grand Banks, 843,000 pounds halibut, about 100 barrels mackerel and some 1,400 barrels Fortune Bay herring in bulk, the latter selling at auction at 45c. per barrel unpacked. The large receipts of halibut this season has opened to the market a new food supply, choice pickled halibut being offered to the Western trade at $8 per barrel.—*Cape Ann Advertiser, 10th.*

East Hampton—June 10th.—The well known lake at East Hampton, has been visited by a large number of anglers, and some have been very successful. The enterprising landlord of the Belle House at East Hampton, has put a large number of salmon trout into the lake recently, and visitors may expect some fine sport with the new fish some day, in addition to the native stock.

MASSACHUSETTS—*New Bedford, June 9th,* 1876.—The warm days of June have started up our amateur fishermen, and in the windows of some of our saloons may be seen fine displays of the spotted trout, but all these were eclipsed by the "catch" of Dr. Frank Ward, whose skill as Dentist and "troutist" is well known to our citizens, who returned yesterday from a two day's visit to a neighboring town with twenty fish, the largest weighing two pounds and seven ounces, and several of the others over one and a half pounds each. The first sword fish of the season was yesterday brought in by the veteran in that line, Capt. Cobb, of pilot boat Hornet. CONCHA.

NEW JERSEY—*Barnegat Inlet—Kinsey's Ashley House, June 9th.*—June 2d. Blue-fish scarce, and run small, only one to three per boat taken. Black fish and sea bass plenty. June 3d. No blue-fishing. June 4th, do.; June 5th. do.; June 6th. A large school entered the inlet at five o'clock P. M., they ran from four to six pounds. Geo. B. Dixon and W. W. Twaddell, of Philadelphia, took 200 pounds blue-fish; Hugh McIlvane and I. G. McIlvane, of Philadelphia, ninety pounds; D. L. Kettler, C. Tucker, and ladies, of Philadelphia, forty blue-fish, 310 pounds; Capt. B. Predmore and party, 216 pounds. June 7th. Inlet and outside the bar alive with blue fish; D. L. Ketler and ladies, forty-two blue-fish, smallest weighing six pounds, largest nine and three-quarter pounds; Chas. D. Middleton and ladies, Germantown, Pa., 200 pounds; Hugh McIlvane and son, thirty-five pounds; Capt. R. Potter, Tom's River, forty-eight blue-fish, none weighing less than eight pounds; Wm. Beatty, Newark, 180 pounds; C. E. Canerly, Philadelphia, forty-nine blue-fish average seven pounds. June 8th. Blowing a gale from southward, too rough for sailing, some boats came in with from ten to fifteen each. R.

CANADA—*New Brunswick, June 8th.*—The water keeps unusually high in all the rivers on the north shore of New Brunswick. Parties were to start on the first trouting trips of the season on Monday, 5th, but there was heavy rain on the 4th, which continued the 5th, and increased the volume of water very considerably, besides unsettling it. As clear water is a *sine qua non* to angling, the rains have had the effect of putting the season back four or five days. The thermometer stood at 88° in the shade at the Miramichi towns on Friday, 2d instant. On Saturday night, Sunday, and Monday it was down to 45°. Fly fishing would be an impossibility in such a temperature, especially when it covered a swollen stream. The St. Lawrence *Advance* says that the first salmon caught on the north shore of New Brunswick this season was taken by Mr. Jonathan Noble at Fox Island, Miramichi, on the Queen's Birthday—24th of May. The same paper says that salmon appeared earlier, and are of larger average size this year on the north shore than for the three years previous.

P. S.—Since writing you, Messrs. J. M. Ruddock and R. McAndrews, who had gone off quietly to Indiantown on the evening of the 4th, have returned. They say they made their calculations for the trip, and were not to be deterred by the rain. They got a twelve pound black salmon, a grilse, four large trout, and a dozen and ten smaller ones. The grilse weighed six pounds, one trout five pounds, and three others averaged four pounds each. They fished about six hours. They report the water a foot deep over Indiantown wharf, and they could not get out on the point just below the brook. Such a fare, under the circumstances, promises a splendid run in two or three days. D. G. S.

MUSKOKA—*Gravenhurst, June 9th.*—Trout in the Hock-Rock are very plentiful this year. I caught forty-two last Monday, nineteen on Tuesday, and fourteen on Wednesday afternoon. They averaged four ounces each; rather a small average, but the larger ones, about half a pound, gave us some good sport. I used both the fly and worms for bait at the same time, catching two trout at once sometimes. Pickerel fishing is splendid in Muskoka Lake; no trouble in getting twenty to thirty pounds of an evening,

by either trolling or with rod and line, baiting with worms. Salmou trout fishing is also good. I am sorry to say that some of the boys are catching bass which are now out of season. George Ross, of Magnetewan, informs me that he is prepared to guide fishing parties to the best trout grounds on the Magnetewan River.

SHOTTED CASTING LINES FOR FLY-FISHING.

EDITOR FOREST AND STREAM.—

I see your neighbor of the *Rod and Gun*, published a letter last week from our friend Genio C. Scott, which rather astonishes me. I am a confirmed fly fisherman, and while I do not wish to renew the old fight of "Worms *vs.* Flies," I must say, the advice he gives, to just split shot on his fly cast, is new to me. "Live and Learn," I suppose I must. I should like to see our friend "Genio" trying to fish from the tangled bank of the Tobyhanna or Lycoming River, with split shot on his flies. I am thinking he would soon turn to "worms" for bait. H.

From a perusal of the article referred to, we do not understaud the writer to recommend the use of shotted casting lines except in especial cases where we agree with him they could be employed with advantage. He says:—"Sometimes trout take the fly under the surface, and it may be necessary to settle the cast by a split shot of the smallest size."

PICKEREL OR BASS.

WEST MERIDEN, Ct., June 7th, 1876.

EDITOR FOREST AND STREAM:—

Judging from your paper of the 1st, my article on pickerel and bass aroused one of the good anglers of the West, and thanks (probably to the types) was the cause of the worthy reply. It was not my intention to say, as printed "In different parts of the country," but different parts of the county, *i. e.*, New Haven. This, by way of explanation to your correspondent, Geo. A. Shufeldt, Jr. I certainly do not find fault with the bass fishing in the West, or in other parts of the country, but I speak only of how we find it in this part of Connecticut. I for one congratulate your correspondent on the fine bass fishing he enjoys at Lake La Belle. I wish we enjoyed the same here, but our ponds are not generally adapted for bass, because their bottoms are often covered with many feet of mud; but our pickerel do well, and have furnished us with good sport until the ponds were stocked with bass, and it is the opinion of many of our oldest fishermen that the bass have made away with the pickerel.

Not far from Meriden is a pond well koown for the last twenty-five years or more for its fine pickerel. Year after year, the yield was good, until about five years ago when the pond was stocked with black bass and a law passed prohibiting fishing there for three years. Well, when the time expired there was a grand rush of fishermen to the pond, all eager to capture some of the famous bass. I need not say how disappointed they were. Very few bass were caught, and as for the pickerel, they have ever since been scarce. I see very plainly, friend Shufeldt is not a very ardent admirer of the pickerel, but let him come East, and see *our* pickerel, and I feel assured that he will admit there is a vast difference between the clean dainty pickerel of the East, and their coarser kin of the West, both for sport and the table. In conclusion I wish to be understood that I do not oppose the introduction of black bass into ponds or streams adapted for them, but, that I am not in favor of introducing them into ponds in which they do not thrive well, and which are already well stocked with good fish to the manor born. VON G.

THE ADIRONDACKS—FISHING AT PISECO LAKE.

PISECO LAKE, June.

EDITOR FOREST AND STREAM:—

I'm just in clover now; that is, if trout, flies, lar, and sweet oil, Bermuda onions, pork and fried potatoes, is say nothing of a nice joint of veal—but I forget it's June; the less said about the veal the better. But if worst comes to worst, I didn't kill that calf, or even hold him by the tail while a friend did it. This calf came into a field where some men were sowing oats, and bit one of the men, and he got mad and killed it, so they tell me, and I hoist it in and ask no questions, (by it you may understand that both veal and you are hoisted in.)

I don't believe, with all your wanderings after the "speckled beauties," that you ever struck this delightful place. Here we are, far enough back from the banks of a beautiful mountain lake to fool the flies who stay down around the "landing" and wait for us, with a bracing mountain air that calls for fire in the stove when we gather around and compare notes, and brag, and I'm sorry to say, lie about what we have not exactly done, but have come pretty near doing during the day. "I got him pretty near up and he jest gin one slap with his tail and he went—and he was jest the biggest laker I've seen this ten years." Par parenthesis (confound these "big" fish, they always get off.)

We are comfortably lodged at Dan Rude's. Our post-office address is Sageville, and Dan is supposed to live there, but I'm quite confident that if Sageville and Dan were both lost more people could know where the former was by explaining that it was the place where the latter lived and "accommodated," than in case of *vice versa*.

Dan's wife cooks trout, potatoes, pork, and coffee, to say nothing of pie, in the most exemplary manner, and never looks cross however unreasonable may be the hour in which you inform her that you are hungry, and cooks you a meal without a protest. How she can be so good natured with those pesky black flies and punkies pegging away at her for I won't say how many years, I can't comprehend. Rude's Hotel is delightfully situated in the midst of a clearing, and has good accommodation and is kept clean; and, as I have said, Mrs. Rude's cuisine is one to suit a hungry man. The lake was originally the headquarters of the Walton Club, and owned by them; they transferred it to its present owners, and a race of burly guides and boatmen have grown up.

The lake can be reached *via* the New York Central Railroad to Fonda, thence by rail 27 miles to Northville, and from there either by stage on Wednesdays and Saturdays, or by water conveyance on other days, 21 miles to Lake Pleasant, where at Sturgis' House good rooms, boats, and table can be obtained; good road right up to the door. This place is easily enough reached, and pleasant enough when reached, to make it pleasant to carry in ladies. From Lake Pleasant, or Sageville, to Steve Andrew's, at the head of the lake, is four miles, and from there to to Rude's is nine miles, all are good roads where a buggy wagon and one horse could take two people and traps. The fishing is good ordinarily, but the brook trout are a little backward as yet; the ice went out of the lake on the 19th May, and the water has not warmed enough yet. Lakers have taken *the* spoon freely, and I underscore that *the* on purpose, for there is only one spoon that will catch either them or the brook trout here, and that is a plain, medium-sized brass spoon, either oval or heart-shaped, well hung, and properly balanced with the hooks. I've got a box full of "butterflies" and "minnows," and what not, but they are not worth putting out here; they look pretty in the stores, but the trout don't see them in the sunlight. Hiram Nichols, my boatman, than whom there is no better, has made from a sheet of brass spoons for me, each one of which is worth the lot of gaudy traps I have bought.

In your issue of June 1st the letter on "Weight of Fish by Measurement" attracted considerable attention, and several gentlemen present volunteered, or rather promised to comply with my request to weigh and measure, that we might prove or disprove the rule. In the following table, No. 1, which was caught by Mr Luther, of Ballston Spa, (telling, excited no little comment, as with a preposterous head he shaded off like a tadpole, and instead of weighing, as every body said he ought to, twenty-five pounds, he could barely trim sixteen. A big healed wound in his jaw showed that at some previous time he had been badly hooked, and stunted. Taking No. 10 as a standard, whose length was 10 inches and weight 6 ounces, or any other you choose, for they were all weighed and measured carefully, any of your readers fond of mathematics can work out the "triplicate ratio of their homologous sides" to suit themselves. I'm not here to "do sums," but to get clear of them.

Dimensions and weight of an average of six hundred pounds of lake and brook trout taken June 1st to 7th, 1876, from Pisceo Lake.

No.	Brook or Lake.	Dimensions.		Weight.		Caught by, and how.

24	Brook.	7½	..	0 3½	0 03	
25	Brook.	6½	..	0 02	0 1½	

We are bothered in our fishing by the "Mohawk chubs," which take the fly or spoon with as much avidity as the trout, and behave so like a speckled trout when hooked that they give us rare heartaches when we have reeled 200 feet of line, and brought our big one to the landing net or gaff. Some fifteen years ago a lot of these fish which had been brought up to use for bait, fishing through the ice, were thrown in; they have increased and multiplied, and are now found from one-quarter pound up to three pounds.

That I have had some fun in spite of them the enclosed list, the greater portion of which were taken by myself, will show you. My "partner" goes out in an hour, and I send this and fish by him. I shall not leave this feating place for some time yet. PISCEO.

The Kennel.

—We had the pleasure of examining on Tuesday, a pair of very fine Scotch deer hounds, Chiefton and Dutchess, the property of L. Thorue, Esq., of Thorndale. These dogs are from the stock of Gen. Custer and the late Hon K. C. Barker. Mr. Oakleigh Thorne, of Millbrook, Duchess Co., N. Y., advertised some dogs of the same stock for sale at very low prices.

—Mr. E. Van Derwerken's fine orange and white setter bitch, Fan, has visited Mr. Thos. Cumming's orange and white setter, Rolla, at Stamfort, Conn. Rolla is from the kennel of our Field and Kennel Editor, and is of the Bruce and Fly strain, orange and white dogs with black points.

—A poultry club has been formed at West Meriden, Conn., which proposes to hold a show of fancy poultry, pigeons, etc., soon. A bench show of dogs is talked of to take place at the same time.

—Mr. Jacob Glahu's black and tan setter, Maggie, is visiting Mr. Jarvis' Dick.

ROB ROY.—Mr. Arnold Burges, of Hillsdale, Michigan, writes us that he has imported Mr. Statter's Field Trial dog, Rob Roy, by Laverack's Fred II. out of Statter's Rhaebe, known as the founder of the Field Trial breed. Rob is black, white and tan, and stauds 23½ inches high. He won the champion stakes at Shrewsbury in 1872, together with four other field trials, and Mr. Llewellin pronounces him to be a getter of graud stock.

DOGS VS. ALLIGATORS.—Dogs are popularly supposed to be the preferred diet of the alligator, and many an unsuspecting canine passing along the river bank is snapped up without warning by the reptiles whose jaws are set like traps along the margiu. It seems, however, that dogs are sometimes found to attack the alligator, and compel him to turn tail and take to his native element. A late issue of the Sanford *Journal*, published at Lake Mouroe, Florida, says:—

"A few evenings since, while a number of young men, including the junior editor, were out in the shoal water of the lake, seining for minuows, a large alligator made his appearance close by. Discovering them, he immediately struck out for deep water, making a great splashing. Our dog, Prince, being along, the young men hissed him after the 'gator, and he went with a will. He jumped on the back of the monster, and quite a skirmish ensued, the dog being under water part of the time. Finally the running fight carried them out in deep water, out of sight in the darkness, and the dog was gone fully ten minutes before he returned. The first instance on record of a dog whipping a big 'gator in his own element."

THE INTERNATIONAL BENCH SHOW.

We have received the following communication from the Committee of the Philadelphia Sportsmen's Club:—

The programme and classification following is in substance that contemplated by the Chief of the Bureau of Agriculture of the Centennial Commission, under whose administration will be conducted the Bench Show of Sporting and Non-Sporting Dogs, to be held in the grounds of the Centennial Commission September 1st to 8th

Dogs of all breeds will be divided into the following fourteen classes, under nine sets of judges, viz.:—

CLASS 1—Hounds.—Fox hounds, harriers, otter hounds, beagles, and dachshunds.

CLASS 2—Greyhounds.—English greyhounds, Persian greyhounds, Scottish deerhounds, and Italian greyhounds.

Classes Nos. 1 and 2 to be examined by the same board of judges.

CLASS 3.—Gordon setters.

CLASS 4.—Irish setters.

CLASS 5.—English setters.

Russian setters and other varieties to be judged with class 5.

CLASS 6.—Pointers.

CLASS 7—Retrievers.—English retrievers, Chesapeake Bay duck dogs.

Class 6 and 7 to be examined by the same board of judges.

CLASS 8—Spaniels.—Clumbers, cockers, springers, Irish water spaniels, King Charles, and Blenheims.

CLASS 9—Terriers.—Dandie Dinmont, Scotch, skye, broken-haired, Bedlington, black and tan.

CLASS 10.—Bull dogs and Bull Terriers.

CLASS 11.—Mastiffs, Newfoundlands, St. Bernard, Siberian or Ulm dog.

Class 10 and 11 to be examined by the same board of judges.

CLASS 12—Sheep dogs.—English and Scotch.

CLASS 13—Miscellaneous.—Dalmatian or coach dog, Pomeranian or spitz, pugs, poodles.

CLASS 14—Toy Dogs.—Cuban lap dogs, Maltese, lion dogs, Japanese hairless, dwarf black and tan.

Classes 12, 13 and 14 to be examined by the same board of judges.

Three graded awards will be made for 1st, 2d, and 3d best dogs over two years old in each breed, and same for 1st, 2d, and 3d best bitches, and the next in quality commended.

Three graded awards will be made for 1st, 2d, and 3d best dogs over one and under two years old in each breed, and same for 1st, 2d, and 3d best bitches, and the next in quality to be commended.

Three graded awards will be made for 1st, 2d, and 3d male puppies in each breed, and same for 1st, 2d, and 3d female puppies, and the next in quality to be commended.

A sweepstake award will be made for the best foreign bred dog of any breed, one year old and over, displayed by any exhibitor; also for the 2d and 3d best, the next in quality to be commended.

A sweepstake award will be made for the best foreign bred bitch of any breed, one year old and over, displayed by any exhibitor; also for the 2d or 3d best, the next in quality to be commended.

A sweepstake award will be made for the best home bred dog of any breed one year old or over, displayed by any exhibitor; also for the 2d and 3d best, the next in quality to be commended.

A sweepstake award will be made for the best home bred bitch of any breed, one year old or over, displayed by any exhibitor; also for 2d and 3d best, the next in quality to be commended.

The authenticated pedigree of sire and dam is all that is required in entering dogs.

No charge will be made either for space or as entry fee; those proposing to exhibit will apply for the official forms, which, when returned, will be registered, and in good time the exhibitors will receive permit for space and labels, to be attached to the animals, a necessary requisite to gain admission to the grounds.

All dogs entered for competition will be judged by the standard of excellence adopted by the London Kennel Club.

Independent of the awards that will be made by the Commission, the following is a list of individual prizes offered, which no doubt will be greatly increased in number before the bench show takes place:—

The Chicago *Field*.—A silver cup for the best setter (dog or bitch) of any breed, one year old or over.

FOREST AND STREAM.—A valuable prize.

The Philadelphia Sportsmen's Club donate $200 for the purchase of two prizes, one for the best setter dog of any breed, one year old or over, and one for the best pointer dog of any weight, one year old or over.

Mr. C. S. Westcott offers a suitable prize, value $50, for the 2d best setter dog of any breed one year old or over.

Mr. Frank Roan offers a silver cup for the best imported setter dog between one and two years old; and a silver collar for the best dachshund dog of any age.

Mr. Charles E. Tucker offers a silver cup for the best cocker spaniel

John Krider offers a silver mounted dog whip for the best American bred setter, one year old or over.

Capt. A. H. Clay offers a silver whistle for the 2d best American bred setter, one year old or over.

The Detroit Gun Club, as appeared in the Chicago *Field*, will offer a very handsome prize for sporting dogs.

P. C. DESUIQUE,
CHAS. S. WESTCOTT,
BENJ. W. RICHARDS,
} Com. of Phila. Sport's Club

It will be observed that the above communication is not an official document from the Bureau of Agriculture, under whose jurisdiction the Bench Show will be held. The publication of it, however, is authorized, the object being to provoke criticism, and obtain such suggestions from qualified gentlemen as will enable those having the matter in hand to make the exhibition a success in every particular. We shall be glad to print criticisms or suggestions from intending exhibitors or others, or communications can be sent direct to Burnet Landreth, Esq., at the Bureau of Agriculture, Centennial Buildings, Philadelphia. We have not space this week to make the comments we desire to, but we would call attention to one clause that we think should decidedly be omitted. That is, one which makes a pedigree of any extent obligatory. There are many reasons why this clause should be omitted. In the first place, dog breeding as a fine art is too new in this country. Many sportsmen have contented themselves with buying good dogs without troubling themselves as to their ancestry, beyond, perhaps, ascertaining that the breed was pure. Again, if we understand the object and intent of a bench show, it is that a standard of excellence may be formed and judged upon by the appearance and points of the animal exhibited, not upon the qualities of his ancestors; or if the latter *is* the case, and descent from a celebrity is to be the standard of excellence, why not send the pedigree as a proxy and keep the dog at home? It has not been the custom heretofore to demand pedigrees of dogs; but in case of tie on points to give the award to the dog with the pedigree. The introduction of such a clause will not only be detrimental to the present show, but to all future ones.

DOGS FROM INDIA.—The *Daily News*, in describing the animals brought home by the Prince of Wales, has the following:—"There are eight Indian dogs. Four of these are tailless dogs—jackal-looking animals with sharp noses, cock ears, and not enough of tail to swear by, much less to wag; and four are "hill" dogs, varying somewhat in breed. One pair are not unlike rough and rather underbred collies, with the black-and tan well developed on the face, but they are more muscular, especially in the limbs, and in some points they resemble the otter hound. The other pair, which are a present from Sir A. Ramsey, are much larger and heavier dogs, bearing a resemblance in some point to the mastiff, in other to the St. Bernard. One is an especially noble looking dog, although his appearance has been temporarily spoiled by his being clipped.

French poodle fashion. He has a heavy coat of tawny orange hair darkening on muzzle and limbs; his head is as full of majesty and intelligence as that of any St. Bernard I ever saw; he is large-framed, tall, and powerful, and his whole aspect is full of dignity and sagacity. One of the cages on the Raleigh is occupied by a Himalayan *bouzu*, or wild dog, an animal strongly resembling an English fox, but larger and heavier. The wild dogs of the Himalayas hunt in packs; they are very ferocious, and are regarded as untamable, but the mood of the animal on the Raleigh has so far softened that he licks the hand of the man who attends to him." It is added that Mr. Drew has brought home with in the Scrapis some black partridges, the acclimatization of which in Norfolk the Prince is anxious to attempt. If the attempt is successful a new sensation will be introduced into partridge shooting, for when flushed they rise rocketing exactly like pheasants.

DRIVING A STURGEON.—The period of mythology when they used to drive dolphin teams harnessed to barges, was not more strange than the present, and feats which seemed improbable to us at school days, are reproduced in these days with the faithfulness of fact. We find the statement in a country paper that Mr. Robert L. Pell, residing near West Park, on the Hudson River, having caught a sturgeon nine feet long, conceived the idea of harnessing it to a boat after the fashion of the Tritons. Accordingly a tackling of leather and rope was attached to its body in a way which prevented its slipping behind the fins, and the fish having been placed in an artificial lake a quarter of a mile long, on the grounds of Mr. Pell, the experiment began. "In order to obtain the services of the sturgeon when needed, a pair of rope reins, eighteen feet long, were attached to the harness, and these were fastened to a large cork float, which swam upon the water. A boat five and a half feet long and two and a half wide was then constructed. It could contain but one man, and in that Mr. Pell took his seat, and attached the chain at the bow to the floating cork. The sturgeon soon began to move, and the moment he realized that a further impediment existed to his movements, he shot frantically ahead. The boat swayed to and fro, and the spray, dashing furiously from the prow, flew in every direction. Frequently the gunwhale was an inch or two below the water's edge, but such was the rapidity of motion that the water had not time to overflow it. The lake being but seventeen feet deep, and the reins eighteen feet long, there was no possibility of being pulled under the water by the diving of the fish, and the career of the boat was uninterrupted. The sturgeon kept near the sides of the lake, and swam four times around without slacking his pace. He then rose to the surface, rolled on his back, and exposed his white stomach to the sunshine, as if to say, 'I have swum long enough, and am not going any further.' Mr. Pell, satisfied with his experience, then detached the boat from the float, and landed. The fish soon again disappeared. At each subsequent sail, either by Mr. Pell, or any one else, the fish would rush regularly four times around the lake, and no more. He would then, as at first, regularly roll over on his back and rest. A neighbor of Mr. Pell caught a large sturgeon, and intimated his experiment in the river. Matters worked well for a few moments, but it suddenly occurred to the sturgeon to dive. This, the river being deep, he could easily do. To the dismay of his owner, under went the cork float, and a violent jerk at the prow of the boat was a warning to jump into the stream. The boat went down, and was lost to sight for several minutes. That was the beginning and end of harnessing sturgeon as a river pastime.

CUTTING UP SEAL FAT.—A Harbor Grace, Newfoundland, correspondent sends the following notes of seal fishing:—

"It would, I think, puzzle some of your ablest physicians to say how one hundred and seventy to two hundred men, more or less, can find comfortable and sanitary accommodation in our sealing steamers. It is the mercy of God that we have not to mourn over prevalent disease and death. Is seal fat a disinfectant? I consider that a gentleman's dog has far better times of it than our poor fellows. The only difference is that dogs have no hereafter—men, women, and children, have.

"They don't do things here below by oil vats now; no, they do things by steam. That is, they must have steamers to go hunting the seal, and they have steam machinery to cut up and render the fat. Messrs. John Munn, & Co., on whom this whole place is depending, have an immense number of stores, wharves, &c. Their steamer, the Vanguard, arrived from the seal hunting on 14th April with 13,500 seals, or rather seal pelts, that is the skin and fat of every individual seal, the carcase of which becomes a portion for the foxes or the polar bears, or the lord fish at the ice, by a species of lawful administration *ad colligendum bona*, whereby poor animals are fed. Well, such seal pelts are handed and hoisted up to the skinning loft where they are laid upon the table, and the skin is separated or cut off from the fat by adroit men who are used to the business. Then the fat is cut up into junks which are thrown into the "mill" with large revolving knives. Quickly it is cut up much smaller, and is caused to pass to the cutters or smaller revolving knives. This machine is called the "sausage grinder," a very expressive name. Our Scotish friends have a favorite dish called minced collops, which I have not tasted for more than half a century. Well, the fat as cut up by the sausage grinder, and as flowing out, is as finely cut as minced collops. It passes into the pans and is rendered by steam at a temperature of 160°, thence it passes into the bleaching pans and then into the casks. C."

—Wire gauze as a substitute for glass is fast gaining the attention of persons engaged in constructive works. It is much employed in the Regent's Park carriage works for the lifting door-screens of carriages, for which hitherto glass has been exclusively used. It is admirably suited in summer for this purpose, as it subdues the glare of light, moderates the heat, and admits but little dust, while it insures perfect ventilation. The occupants of a carriage provided with these gauze windows see plainly enough through them, and have all the advantages without the disadvantages of glass.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

R. E. R., Ferrisburg, Vt.—The small bird you describe is probably the redstart (*Setophaga ruticilla*).

UNDER TWO FLAGS, Wilmington, Del.—Thanks for the information relating to sketch of Steeple Chasn.

R. S., Springfield.—Will you be kind enough to inform me of the price of the Dittmar rifle powder? Ans. $1 per can.

CONSERVA.—B. Greenwood, 13 College Place, this city, is the only person we can learn of who deals in fresh and salt water plants for aquaria.

W. H., New York.—Can you inform me where Blenheim spaniels can be purchased? Ans. We cannot, but perhaps some of our readers will inform us.

O. F, Ancram, N. Y.—Will you please inform me the best time and bait to use to fish for salmon trout? Ans. Now is the time, with "gaug" or trolling spoon.

O. F. W., Pittsburgh.—Can you send me a form for score book for pigeon shooting matches? Are books to be obtained ready bound? Ans. Have sent score cards for pattern.

T. A. S., Macon, Mo.—Please inform me if I can find a copy of "Chatnck's History of Concord, Mass.?" Ans. Cannot hear of any; perhaps some of our correspondents can supply it.

T. W., Stark Plains, Pa.—Do goldfish shed their scales, and when? Ans. Only when they are injured, so far as we know, and then death generally results from fungus forming upon the abraded part.

SUBSCRIBER, Boston.—I intend buying a Wesson sporting rifle which I should use principally for off-hand target practice. What length of barrel and calibre would you consider the best? Ans. 30-inch barrel and 44 calibre.

J. C., Achtabula Ohio.—Will you please inform me if the law in Michigan has been altered or changed for 1876 in regard to woodcock shooting? Ans. We have no advices of any change. Watch our paper closely until July 5th, when the law expires.

P. G. Milburn, N. J.—Will you kindly decide the following question? In shooting in a match with revolvers, at short distances, is it allowable to use both hands to hold the weapon? Would it be allowed at Conlin's or any other first class range? Ans. No; but one hand is allowed.

J. J. W., Jersey City.—Will you please inform me through your paper where in New Jersey, within one hundred miles of New York City, I can find good quail shooting next fall, and some woodcock shooting; and if you know of any farmer in said locality? Ans. Address A. J. Haylor, Tenafly, N. J.

L. P., Washington, D. C.—Can you tell me if it is possible to get artificial rubber frogs in New York? I think the bass in the Potomac here would take it, as they seem fond of the natural critter? Ans. They are kept by most of the dealers in fishing tackle who advertise in our paper. Write to any of them.

J. G. A., New York.—Please inform me whether the game laws of Connecticut allow woodcock shooting in that State in July this year? I am told by several sportsmen that a law recently passed prohibits shooting until the fall. Is this the case? Ans. The close season for woodcock does not expire in Connecticut until October 1st.

PATRON, Washington, D. C.—Would you be so kind as to inform of a good work on "Gold Fish Culture," or any information pertaining to, and where likely to procure same? Ans. No book that we know of, but previous numbers of FOREST AND STREAM, will give you some information. See May 28th, 1874, and November 12th and 18th 1875.

SCULLS, Phila.—You ask in the last issue that correspondents sign their names and not pseudonyms. If you would rather have my name at the foot of what I send, instead of "Sculls," I have no objections. Ans. The request applied only to the Department of Natural History in our paper. We do not desire the names of correspondents, except for our private use.

D. H. E., Peotone, Ill.—Is Bailey's "Our Own Birds of the United States" good for determining the names of birds and eggs? What is Audubon's "Synopsis?" Ans. 1. No. Better consult our article 'May 1st, on "A Library of Natural History." 2. It is a terse account of the classification used by him, with more or less of the technical characters of the groups given; a book of reference.

MINSTREL, Jersey City.—As you are supposed to know everything, can you inform me when Dan Bryant last appeared in public, and where? Ans. This is a little out of our line; we believe, however, that he made his last appearance on April 5th, 1875, at the Twenty-third Street Playhouse in the musical burlesquio "Les Brigands Noir," taking the role of Mlle. A-I-Mee, Queen of the Brigands.

C. L. Chester, Vt.—Will you please explain what is meant by "best and best" boats? also "working boats?" I see these terms used in accounts of boat races, and wish to know what style of boats are used? Ans. The first is a term used in England to indicate that each contestant may choose his own boat, of any size, weight, or construction. The second refers to waterman's working boats, such, for instance, as our Whitehall boats.

G. D. F., Poughkeepsie.—Seeing that you answer your correspondents' questions very satisfactorily, I take the liberty of writing you. I have a chance to buy a Sharp's cabbine (new model) which I like very much. I want to know if it would hurt it very much to shoot shot in it? You see, if it would shoot shot and ball both, I could have some fun shooting at a target, and also take it out for a hunt. Ans. It will not injure the rifle in the least to shoot shot out of it.

W. A. W., Providence, R. I.—1. How long ought a canvas boat to last with fair usage, and be tight and in good order? 2. Is the canvas water-proofed by the Tappan process as good as any for that purpose? If not who makes better? 3. What is the usual weight and thickness of canvas employed for that purpose? Ans. 1. For years; we have known one to last for years and is still good. 2. Mr. Tappan claims that there is no other durable for any length of time. 3. 14 oz. duck is the best weight to use.

P. C. P., Berkeley Springs.—In your issue of June 1st I see the advertisement of W. H. Baker's three barreled breech-loading gun, Lisle, Broome County, N. J.; can you give me any information in regard to its shooting qualities. It seems to me that it is the gun we want more in this country as we are liable to meet with deer, bear, or smaller game at any moment? Ans. As to the shooting qualities of the gun we have no knowledge, but it struck us, when we examined it, as being the most feasible of any combination gun we have ever met with.

TWO SPORTSMEN.—Do fish hear? Ans. This question has been much discussed and tested by experiments. The conclusion is that they do not. They are, however, extremely sensitive to a jar, and any loud sounds uttered on or near the water, or sudden shocks occasioned by the dropping of an oar, or the like, would communicate a vibration through the water to the fish, and startle him. A deaf mute can be made to hear the sound of a piano or harp by resting one end of a stick of ebony or other hard wood against the instrument, and the other against the teeth.

INQUIRER, Indianapolis.—1. How can I have my dogs entered in the American Kennel and Sporting Field, if possible to have them entered at all? 2. I have two valuable setters (dog and bitch) who are troubled with a lameness in the right leg. It does not seem to be in the foot as I have examined that and can find nothing wrong in either dog. Ans. 1. By writing to Mr. Arnold Barges, Hillsdale, Michigan, you can ascertain whether a second edition of his book will be published. 2. Your dogs may have wrenched themselves in play. Urdin cool oil is an excellent remedy for sprains

A SUBSCRIBER, Cleveland.—We answer questions respecting goldfish culture very frequently. By searching our files you can get much information. We can select for you the copies of our paper containing references to the subject, if you desire. A fish pond in your locality would pay. The fish are easily raised. Let the water get warm. A few minnows placed in a mudhole in spring will produce thousands of young in June, but are liable to be eaten by the larvæ of the dragon fly, which like such places for their deposits of eggs. There should be a fair admixture of sand with the mud of the pond.

T. R., New York.—Next fall I intend spending a couple of weeks in the Adirondacks, and being told that rabbits are very plentiful there, I request your advice as to the best means of hunting or trapping them. I am going into the thickest part of the woods, where saup-shooting is next to impossible; also what is the best gun, English or American, that I can get for $100? Ans. Take with you a good beagle hound broken to run rabbits, and you will be able to shoot enough to make good sport. For $100 you can purchase an excellent gun of either American or foreign make. See our advertising columns.

P. S. D., Baltimore.—In reading your valuable paper I notice you refer to a breed of dogs called "scooners." I have one of them (rather my sporting friends have concluded upon his being of that breed), but his actions in the field are very unsatisfactory. Probably his training (I trained him) has been imperfect. Please tell me the nature and qualities of one of that breed, and is there any way by which I can rectify his faults? Ans. The training of your dog has been neglected, else he would have been broken of his "scooner" habit; and the sooner you apply a few vigorous cuts with a three foot rawhide, at the nick of time, the sooner he will give it up.

GEO. H., Grantville Mass.—1. Will you be kind enough to inform me in your next issue what you consider the easiest and surest remedy for killing flies on a dog (setter); also, if anything, what you would use to prevent their coming? 2. Is there no preparation for keeping flies, etc., off your face, and whose preparation is most reliable? Ans. 1. By washing your setter with a strong lather of common soft or hard brown soap; it will kill every flea it comes in contact with, and the kennel or place where he is kept must be kept clear of fleas by fumigation with sulphur, or by washing with strong soap suds. 2. Use sweet oil, with a little tar added thereto.

BASS.—In one of your answers to a correspondent who was going to Perry Springs you advised him to take fishing tackle for black bass in Illinois River. Are you certain that there are black bass there; the fish wagons tell me they don't know of any? What is the the best part of the river to catch them in—bars or deep water, banks or middle of stream, or mouth of creek? The best bait and length of line, and size of hook to fish with? Ans. Bass are caught in various parts of the Illinois River, near the sand-bars, with trolling tackle, a rod, reel, 200 feet of line, and a spoon. Lincoln, ten miles north of Elkhart, is a good point for black bass, spotted bass, wall-eyed pike (called salmon there), and pike.

G. T. E., Milton, Mass.—Please give me some information so that I can distinguish a young shad from a herring. We hatched out here in the river three years ago two hundred and fifty thousand shad spawn, and some fish have been taken here that are about the size of herring and some say that they are young shad. Ans. It is difficult for any one not accustomed to handling young shad and herring to tell them apart. Seth Green says: "There is a difference in the mouth. The shad is the largest, and the under jaw the longest. The teeth on cusb on the inner gill in the mouth are much longer than a herring's, and they have black spots about the size of the end of the little finger on each side of the back."

D. A. H., Ashbysburg, Ky.—1. Do you send the bound volumes of FOREST AND STREAM by mail, post-paid, for $4? 2. Is there good hunting and trapping in the southeast part of Missouri and the northeast part of Arkansas? 3. Where can I get a map of that country? 4. Can a nervous person, by a heap of practice, become a good shot with a rifle? By judging my writing do you think I am too nervous to make any kind of a rifle shot? What is good for the nerves? 5. How do they exterminate the trigger pull of rifles? Ans. 1. No, they cannot be sent by mail. 2. Yes. 3. Write to J. D. Brown, Sedalia, Mo., for map of Kansas, Missouri and Texas R. R. 4 Yes; give up tea, coffee and tobacco. 5. By the weight on the trigger necessary to pull it and explode the gun.

R. M. B., New York.—Can you tell me of a place not more than 75 miles from Philadelphia where I can find good trout fishing. I do not care about camping out, and I do not want to pay high board. Ans. Mohoopany trout stream, Sullivan county, is within a day's ride of New York or Philadelphia, reached via Delaware & Lackawanna Railroad to Mahoopany Depot. Hotel at the Forks; also T. M. Robinson can accommodate four boarders, and would probably suit you as to price. Swartwood will meet you at the depot. The headwaters of the south branch of the Mahoopany and other streams that take their source in Long Pond, abound in medium-sized trout. Col. Pickett has a fine house at Long Pond, where he entertains many city boarders. Reached by wagon from Dushuan, on the Sullivan & Erie Railroad, to Berwick, on the Susquehanna River. Laport and Towndale are the only large towns in this section.

C. H. V. D., Brooklyn.—I see by your paper of the 1st inst. that "striped bass have been caught from the boat-house floats on the Harlem River, in the Little Gate, and from foot of 120th street, N. R.," and in connection with that same, will you be so good as to answer the following questions, 1st: Is it likely a fair quantity can be taken in either of the above named places during the last week in this month? 2d. What tide is best to fish on? 3d. What bait would you advise, crab, shrimp, or clams? Ans. The bass, particularly in summer, is a capricious fish and there is no certainty of catching him to-morrow where you find him yesterday. We do not think the fishing will be really good now until fall, when bass will run up the little bays and creeks which indent the Westchester shores of Long Island Sound. We have generally found them to bite best on the last of the flood tide and during high water, and for bait use shedder crabs and shrimps.

A. C. T.—Are there many ducks at Schroon Lake? Ans. At this season only a few summer ducks. 2. How is the fishing? Ans. Good; trout, lake trout, or pickerel in the lake and neighboring streams. 3. Which is the best hotel and the best way of getting there? Ans. This sort of question is asked continually by our correspondents, whom we are most anxious to oblige; but to do so we are compelled to do a vast amount of gratuitous advertising. We have sent circulars to the proprietors of the Schroon Lake hotels, and several hundred others, soliciting their cards at less than half rates; the result is *nil*, as shown in our advertising columns. However, not to put too fine a point upon it, there are three hotels at Schroon Lake, any one of which is good, and the locality is reached by stage from Riverside on Adirondack Railroad to Pottersville (6 miles, or by railroad from Crown Point on Lake Champlain to Hammond's Furnace, and thence by coach 14 miles). See Wallace's Adirondack Guide, published and for sale at this office; price $2, with splendid map.

GEOLOGICAL SURVEY OF TEXAS.—There has been laid upon our table the Second Annual Report of the Geological and Agricultural Survey of Texas by S. B. Buckley, State Geologist. The report contains what Mr. Buckley considers the most useful things pertaining to the agricultural and mineral resources of the State, leaving scientific matters for his final report. The survey was continued. The reports of the silver indications in Presidio and El Paso counties are very encouraging, and copper, coal, and other valuable minerals are found abundantly in certain parts. On page thirty is some interesting archæological matter. The latter half of the report is devoted to a discussion of the soil, crops and forests of the State, and the best manner of cultivation in that latitude.

IMPORTANT.—Care should be taken, in buying Fishing or Hunting Suits to get a genuine Robbird Suit, and not one of the worthless imitations which are being put on the market. The best is the cheapest

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, JUNE 15, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Editor and Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, June 15th.—Racing: Jerome Park. Trotting: Buffalo, Elmira, Homer and Rhinebeck, N. Y., Point Breeze Park, Philadelphia, Grand Rapids, Mich. Rifle: Spring Meeting Syracuse R. A. Pigeon Shooting Tournament: Toledo, Ohio. Regatta: Bergen Yacht Club. Base-Ball: Mutual vs. Chicago, at Brooklyn; Boston vs. St. Louis, at Boston; Athletic vs. Cincinnati, at Philadelphia; Hartford vs. Louisville, at Hartford; Arlington vs. Rhode Island, at Providence, R. I.; Chatham vs. Brooklyn, at Capitoline Ground; Orange vs. Princeton College, at Princeton; Continental vs. Riverside, at Prospect Park.

FRIDAY, June 16th.—Trotting: Grand Rapids, Mich.; Pontiac, Mich., Peru, Ind. Pigeon Shooting Tournament: Toledo, Ohio. Base-Ball: Eagle vs. Nassau, at Brooklyn; Chatham vs. Hoboken, at Hoboken; Brooklyn vs. Mutual, at Brooklyn.

SATURDAY, June 17th.—Racing: Jerome Park. Trotting: Peru, Ind.; Pontiac, Mich. Regatta: Dorchester Yacht Club; Bunker Hill Yacht Club Review; Harlem River Rowing Association Regatta; Schuylkill Navy Regatta; Pioneer Boat Club, Brooklyn. Base-Ball: Mutual vs. Chicago, at Brooklyn, E. D.; Boston vs. St. Louis, at Boston; Athletic vs. Cincinnati, at Philadelphia; Hartford vs. Louisville, at Hartford; Produce Exchange vs. Staten Island, at Capitoline; Osceola vs. St. Cloud, of Orange, at Prospect Park; Wionna vs. Nameless, at Prospect Park, Brooklyn; Orange vs. Resolute, of Elizbeth, at Orange; Madison vs. Athletic (of East N. Y.), at Capitoline; Jasper vs. Athletic, at Manhattan College Ground.

MONDAY, June 19th.—Trotting: Belmont Park, Philadelphia.

TUESDAY, June 20th.—Trotting: Syracuse, N. Y.; Jackson, Mich.; Poughkeepsie, N. Y.; Terre Haute, Ind.; Beacon Park, Boston. Rifle: Competiton at Creedmoor for places on Irish Match team. Base-Ball: Chelsea vs. Olympic, at Paterson; Orange vs. Arlington, of New York, at Orange.

WEDNESDAY, June 21st.—Trotting as above. Meeting of Mass. Anglers' Association, Boston. Rifle: Competition at Creedmoor. Ohio State Association for Protection of Fish and Game meets at Cincinnati.

TO PATRONS IN ARREARS.—In view of the change in the business management of this paper, we beg those who are in arrears for subscriptions and advertisements to pay up at once, so that we may square accounts to June 1st, and wipe off the old slate.

☞ Hereafter we shall stop our paper two weeks after the term of subscription expires, without farther notification.

—A request by the Editor of the Department of Natural History in this paper that correspondents should sign their own names to articles they send him, has been misinterpreted as applying to articles in general through all the departments. We do not desire the full names of our writers, except for our personal use and their own advantage.

GAME PROTECTION.

THE CLOSE TIME FOR WOODCOCK.—We have replied to a considerable number of queries as to any change in the close season for woodcock, to the effect that, as the proposed amendments to the game laws had not passed the Assembly, they remained as in force last year. We now learn that the supervisors of several counties have made regulations altering the close time for woodcock. Among them, we are informed, are Oneida and Lewis counties, in which the close season has been extended until September 1st, and in Oswego till July 15th. We were aware that some time since a bill passed the Assembly giving to the Boards of Supervisors of various counties the power to make such local regulations as would result in the better protection of their fish and game, but did not know that it reached to the extent of nullifying the State laws regarding close seasons. If such is the case, and if each county is to have its own game laws, our legislators at Albany need trouble themselves no more about them, and sportsmen, when taking the field, can provide themselves with an extra wagon to carry the different enactments. The game laws of this State are already too heavily burdened with enactments and amendments relating to particular localities, and the sooner they are all done away with and one general simple law passed the better. In the meantime we would suggest to the Boards of Supervisors, who have made their local regulations to conflict with the State laws, that they show an equal amount of activity in enforcing them.

WEST JERSEY GAME PROTECTIVE SOCIETY.—Periodically, inquiry is made by our readers as to the functions and operations of this society, against which there seems to be an unreasonable prejudice and opposition. This is due mainly to ignorance, and the apparent inability to comprehend the objects and prerogatives of the society, and the character of the charter under which it works. We are indebted to the Atlantic *Democrat*, published at Egg Harbor City, for a clean and satisfactory statement, which is in the main a repetition of what was printed in FOREST AND STREAM in October, 1875. We quote:—

"The society was organized and incorporated for a two-fold purpose: To protect the harmless birds and the feathery as well as nimble game yet found in the southern county, also to protect our citizens (especially farmers) from the damage formerly inflicted by foreign marauding hunters, who came out from the cities to shoot and scare away the agriculturist's best friends, and in so doing trampled down fields and tore down fences, besides shooting or stealing strange poultry. The argument is often made that under the charter of the W. J. G. P. A., distinction is made between the citizens of New Jersey and of other States, prohibiting citizens of other States from enjoying the same benefits with those from this. The charter requires all non-residents to take out certificates at the cost of five dollars the first year and two dollars every succeeding year. The only requirements to membership are the payment of dues, and as no election is necessary, it is not possible to exclude any person from membership on the ground of prejudice or dislike. The funds of the society are derived from the membership dues, and after defraying all current expenses, the charter of the society requires the balance of the funds to be expended in the purchase of fish and game. This game and fish is distributed among the different members, over the six counties which are included in the charter, as evenly as possible. In addition to the above, the society uses every possible means in its power to prevent the shooting of game and fishing out of season."

NEW JERSEY.—Our Barnegat correspondent writes:—

"Our new law for the protection of fish went into effect on June 1st. No more pounds and gill nets. Only to be set at night. We anticipate plenty of weak-fish on the strength of it." KINSEY.

OHIO.—The Ohio State Association for the Preservation of Game and Fish, of which Hon. Thos. A. Logan is President, will meet in State convention on Wednesday, June 21st. We trust that sportsmen throughout the State will by their presence show the interest they take in the society and its work. The game laws of Ohio, and particularly the sections referring to trespass, are by no means all that could be desired, and very important business will be brought before the convention. This association already has the reputation of being a working body, meeting for the purpose of discussing the direct objects of its organization. The effects will soon be apparent.

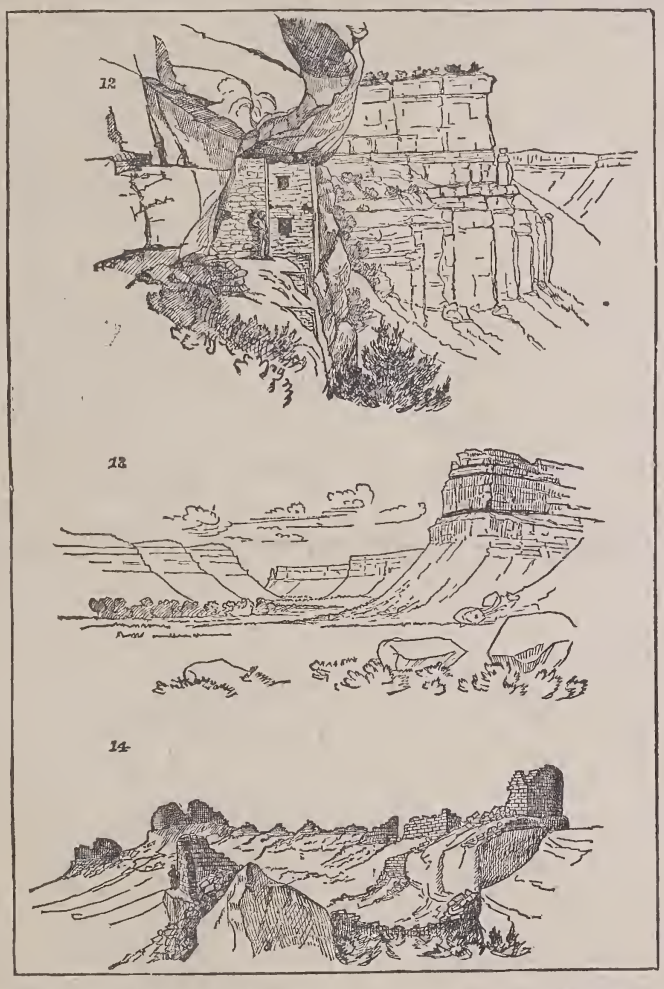
—An honest and humble admirer says. "I have been a subscriber to your paper since it started, and must say I have gained a great deal of information in regard to fishing, although I was under the impression that I was well posted, being an old fly-fisher, always dressing my own flies." To whom we reply with equal humility, that no one person can know *everything*. We must all learn from each other.

—In the schooner race of the Seawanhaka Yacht Club, on Tuesday, course twenty miles to windward from Sandy Hook and return, the Palmer, Captain Rutherford Stuyvesant, won first prize in the first class, and the Idler, Captain Colgate, second. In the second class the Peerless took first prize, and the Estelle second. The other starters were the Rambler, Dreadnaught, Meta, and Ariel.

—While woodcraft is a good thing, it is better not to depend too much upon one's self. An old backwoods hunter who has been a surveyor for fifteen years says: "I never travel in the woods without a compass." A compass often proves a most serviceable friend; it brings you food, fire, comfort, and a home.

OUR CENTENNIAL LETTERS—NO. 2.

THE CLIFF RUINS OF THE SOUTHWEST.



AT the extreme northern end of the Government building—my writing Agricultural building last week was a slip of the pen—the United States Geological Survey of the Territories under Dr. F. V. Hayden and Major Powell has a large exhibit of the results of its work. This comprises a series of the many volumes of information issued, a large number of photographs on glass set into the window, and very many sketches in water color, India ink and pencil of western scenery and Indian life. Many of these sketches are from the facile hand of W. H. Holmes, one of Dr. Hayden's assistant geologists and draughtsmen, and others were made by W. H. Jackson, who for six years has been photographer of the Survey, and has accomplished wonders in securing large pictures in the field. Major Powell's illustrations are mainly from photographs, and sketches by himself along the cañon of the great Colorado. These illustrations were mostly of the present condition and antiquities of those interesting tribes of semi-civilized Indians, remnants of which still exist throughout New Mexico and Arizona, living in settled villages, and subsisting by agriculture rather than the chase.

When, in 1874, I was attached to the United States Geological Survey, it was my good fortune to accompany Mr. Jackson in a search for the very ruins which are represented here—and to find them in the deep cañons of the rivers which drain into the Rio San Juan from the north. Woodcuts taken from three of these photographs I am able to present with this letter, through the courtesy of Dr. Hayden, whose best ambition is to disseminate the knowledge he is able to acquire among those who have not his grand opportunities. This region lies along the southern boundary of Colorado and Utah, and is at the northern edge of the great plateau or *mesa verde* which, cut by deep gorges, stretches southward across Arizona. We began to come upon the remains of villages, where the ground was strewn with fragments of pottery, and the foundations were often visible, as soon as we left the mountains, but not until we had advanced southward a considerable distance did we find any structures remaining. These were of two classes: those in the valley, and those on the cliffs. Photographs of both are exhibited, and they represent to some extent two different eras in the history of the ancient people who built them; the ruins on the bottoms in general being much older than those in the cliffs. The whole lower valley of each one of the streams alluded to above, is filled with these remains, and was once the scene of a populous life, although now totally deserted by permanent inhabitants. The ruins found indicate that the people built their houses in community, or in great blocks, very much as the villages of the Pueblo Indians are constructed at the present day, where the whole, or three sides of a square are built up of solid masonry two or three stories high, divided up into tenements which each family inhabits, and inclosing a court in which is usually found an *estufa* or circular, tower-like building, with a cellar underneath and an entrance through the roof, which is used as a council chamber and place for enacting their religious mysteries, all these tribes being sun-worshippers. This was the perfection of the plan, but very often small and insignificant blocks of houses would be found. Several which we measured, however, like that in Fig. 14, were hundreds of feet square, and a group of such "pueblos," as they are called, would surround some plenteous spring. Then as now, but perhaps not so urgently, water was the chief necessity of life in that country. These people were evidently devoted to agriculture rather than to the chase; loved peace and the amenities of life better than the savage pursuits of the northern redskins, and while not lacking in courage were wanting in the endurance and ingenuity which enabled them to maintain themselves against their foes. It is probable that they abandoned these cliffs and valleys not less than 1,000 years ago, and then not voluntarily. Sifting the traditions of all concerned, we can state with considerable confidence that increasing hordes of the savages from the mountains—ancestors of the present Utes and Shoshone—came down upon them from time to time, raiding upon their plantations and carrying off their women and children. They were unable to resist these attacks, and adopted as a means of safety the plan of building places of refuge upon the high and perpendicular cliffs which hem in both sides of the canons, as appears in the middle figure of the plate. The first good example of this cliff architecture which we came upon was half-way down the valley of the Rio Mancos. There are several photographs of it in the collection, and a most excellent colored model of plaster-of-Paris made by Mr. Holmes, which is nearly three feet square, and leaves nothing to be desired. This house was perched 700 measured feet above the river, on a little ledge formed by the decay of a stratum of rock softer than the rest of the cliff. It was two stories in height, made of finely cut blocks of yellow sandstone—the substance of the cretaceous cliffs—accurately fitted and set in a mortar now harder than the stone itself. The floor was the ledge upon which it rested, and the roof the overhanging rock. There were three rooms upon the ground floor, each one about 6 by 9 feet with partition walls of faced stone. Between the stories was originally a wooden floor, traces of which still remained, as did also the cedar sticks which served as lintels for the windows and doors. Each of the rooms was six feet in height, and was nicely plastered and painted what now appears a dull brick red, with a white band along the floor like a base-board. Near the house the ledge had been walled up and made more commodious by

means of splendid masonry, and behind it had been built a cistern holding 2½ gallons of water. Protected from the direct action of storms this house had withstood the wear and tear of ten centuries, and seems good for many more. As these valleys become settled up, the citizens should pass laws guarding these monuments of antiquity from any vandalism with the most jealous care.

From this point all the niches in the cliffs on the western side of the canons—never on the eastern—were filled with the remains of such houses, although generally of ruder construction. Occasionally one structure would entirely fill up a ledge, and a number of families would live together. One such block of houses on a shelf several hundred feet above the valley, was 350 feet long. A model of about one-third of this ruin has been made by Mr. Holmes, and also a truthful restoration of it. Sometimes —particularly farther down the Rio San Juan—numerous pockets or grottos of various sizes had been eaten into the face of the sandstone cliffs by the water. Often the entrance to these would be simply walled up and the cave

I cannot close, however, without alluding to their art. Their architecture, which accomplished the *arch*—a height to which the power of building never rose among any other people on this continent, but the Peruvians (excepting the ice-domed huts of the Eskimos)—manifests their skill in the manipulation of blocks of stone. All this was done of course, with only stone tools; no trace of metal was discovered. The stone implements, which are few, because the ruins have been ransacked by Utes and Navajoes over and over again, exhibit an advanced style of workmanship and a high polish. Many ornaments of fine stone, polished heads of imported sea-shell, stone and pottery, turquoises, pendants for the ears, and rings were found. The rocks were in many places elaborately engraved to represent notable events in their history, the general character of which it is not difficult to determine usually. No horse is shown among all their good drawings of birds and animals. They constructed very nice matting of rushes, and made cord, etc., of the fibrous *yucca* bark. They manufactured strong and gayly-ornamented cloth of

then made a warm house. Here and there the ruins were found grouped into densely populated colonies. It is not probable that they were inhabited continuously, but were resorted to by the shepherds and their families in times of alarm, and perhaps during the stormy season. They are in many cases entirely inaccessible, except by ladders, which the aborigines used everywhere; and traces of steps cut in the rock may yet be found leading to many of them, as, for example, to this cliff-house shown in Fig. 12. When it is considered that the house occupies on its cliff the same ledge as appears in the cut to be continuous with its roof on the next cliff in the rear, the necessity for some aid in climbing will be apparent. Such a position was of course one of the greatest safety when the garrison could hold out against a seige, for one man could defend the approaches against a thousand. But the continual destructive incursions which the inhabitants suffered from the north at last compelled them, no doubt, with reduced ranks, to retreat southward, fighting as they went. The traditions of that warfare, and the fortified places pointed out as battle-grounds, tell a story of the most intense and poetic interest; and a great fame awaits the man who shall immortalize in epic or drama the sad and thrilling history of this almost extirpated people. There are passages in it which afford material for an Iliad. Finally, decimated in numbers, the remnants of the tribe halted on the lofty bluffs, or mesas, on the shores of the Little Colorado in central Arizona, and built new villages now known as the Seven Towns of the Moquis. There are numerous photographs also of these villages as seen from a distance and close by; of the interior of the houses; of their curiously irrigated fields; and of the people at their work. The whole history of these nations is one of profound interest, and I leave it reluctantly, feeling as though I really had said nothing at all about it.

wool, and probably also, some cotton. In the making of pottery they excelled. The shapes included all the forms of plates, bowls, jars, and pitchers, but not many were found with very narrow necks. Much of it was glazed, and ornamented all over with red, black, and white lines and bands, disposed in zig-zags, diamonds, running Greek squares, scrolls, and various other patterns. A ruder way was not to glaze the ware, but indent the outside and smooth the inside. The manner in which they manufactured their pottery was peculiar. They rolled their prepared clay into long cords, which they coiled into the shape of the intended vessel, increasing and decreasing the diameter of the coil to suit the required shape. The adhesive cords were then welded together with the thumb-nail or a stick, and the vessel was ready for ornamenting and baking. A similar method is now practiced by the Indians of the Amazon River, according to Hartt.

I intend in my next letter to describe the exhibit of the costumes and utensils of the modern Indians, of which the Smithsonian sends a fine collection.

ERNEST INGERSOLL.

EXCURSIONS TO NEW HAVEN.—Many of our citizens have been, during the last few warm days, seeking for a quiet and pleasant excursion from the city. It would seem, if numbers are any indication, that they have selected the elegant steamers of the New Haven Line, leaving Pier 25, E. R., (Sundays excepted) at 3 and 11 P. M., and Twenty-third street, E. R., at 3:15 P. M. The cost is but $1.50 for round trip, including berth. Parties leaving at 3 P. M. have four hours in New Haven, and are landed in New York early next morning.

THE LOBSTER AND THE OYSTER.—A friend of FOREST AND STREAM, writing from Chatham, New Brunswick, says that some of the people in that locality seem to have a very high opinion of the sagacity of the lobster. One story on which they found it is as follows:—

Down at Escuminac, which is on the southeast side of the Mirimichi, there is an oyster bed known only to one Harrington, locally known as "Stormy," on account of dirty weather invariably following his visits, with oysters to sell, to Chatham. He had gained a great reputation on account of the superiority of his oysters, but during the past two years those he has brought to market have not been quite up to the mark. Last season, however, he gave his theory of the cause of the deterioration. He says that not far from the oyster bed there is a "gravel knoll" formed by an eddy on the edge of the channel of the Mirimichi. Happening to scan the bottom of this knoll with his "water glass," he observed several large lobsters. Two of them were just leaving it, each having in one claw a pebble about the size of a small hen egg. He directed the lad who was with him to scull the boat along in the direction taken by the crustacea, and the one he was particularly watching crawled directly to and upon the oyster bed. Soon it approached a large oyster, which, on feeling the water stirred, immediately closed its shell. The lobster lay, however, with the pebble poised in its claw, and within half an inch of the thin end of the oyster shell, and in two or three minutes the latter began to open again. As soon as it had opened sufficiently, the lobster, with a quick movement, darted the pebble into the open shell, rendering the oyster powerless to close it. The animal's feelers were then used to extract the contents of the shell, which it ate quite deliberately, and then lay on the spot as if digesting the sweet morsel, and contemplating a similar operation on the next oyster.

Mr. Harrington says that nearly all the largest oysters are destroyed in this way, but the smaller ones cannot open far enough to permit the pebble to be inserted. Mr. Harrington has never yet been convicted of experimenting carelessly with his innate veracity.

ACKNOWLEDGMENT.—We are under more than ordinary obligation to that standard journal, the Richmond *Whig*, for its friendly endeavors to extend the circulation of FOREST AND STREAM throughout the State of Virginia, which we are glad to say are not without their effect, many prominent names of Virginia having been recently added to the list of our subscribers. Alex. Mosely, Esq., one of its editors, is a member of the Virginia State Fishery Commission, and his journal is naturally the promoter of fish culture and angling in the Old Dominion. We find its contents as valuable to us as the politicians do for their especial needs. No doubt the *Whig* would be more than gratified should the next President of the United States be a skillful angler and fish culturist. It is said that a good angler and lover of the wildwoods cannot be a bad man, although given to tricks and strategems for the circumvention of fish.

—We have received the compliment of a crate of very fine new potatoes from the estate of Chas. G. Kendall, Esq., on Palmetto Island, near Port Royal, South Carolina. The Colonel enjoys the good things of this life; his domain is fruitful of melons, oranges, figs, strawberries, and other semi-tropical fruits. He maintains that, being insulated, he is less exposed to frosts than the main-land is; Jack seldom making his appearance there. We trust that our friend's potato bin may never be empty.

CATFISH SKIN GLOVES.—The Canadians are talking of starting a kid glove factory at Port Colborne, the gloves to be manufactured of the skins of catfish (*Siluridæ*), which are found there in great quantities. The fish, after being skinned, will be salted and exported to other places, where they will find a ready market under some other name.

TO TOTE A DEER.—In dragging the carcass of a deer to camp, never draw it by the hind legs. This is against the grain of the hair, making the load heavy and damaging the meat. If a sapling is handy sling the deer to it with its feet tied in pairs, and the nose secured to the pole, so that it will not swing and sling blood all over.

—The Vivisection bill introduced into the British House of Lords by Lord Carnarvon to prevent cruel experiments on animals provides: 1. That the experiments must be made with the sole view to the acquisition of knowledge which will be useful for saving or prolonging human life or alleviating human suffering. 2. The experiments must be performed in registered places. 3. They must be made by duly licensed persons. 4. The animal operated upon must, during the whole of the experiment, be placed under the influence of anæsthetics sufficiently powerful to prevent it from feeling pain. 5. The animal must be killed before recovering consciousness. 6. The experiments must not be made at lectures as illustrations. 7. They must not be made to obtain manual skill in an operation.

— The Florida orange crop for the present season is 25,000,000, worth on an average at the groves $15 per thousand, making $375,000. It is estimated that there are now not more than 3,000 acres of young trees from four to six years old from the bud, some bearing as many as 100 oranges the past fruit season. For the next five years it is believed the crop will gradually increase from the growth of trees to 150,000,000, yielding a product of $2,250,000, or about one seventh of the product of Palermo.

Rational Pastimes.

BICYCLING.

WHETHER it is owing to a natural spirit of restlessness or a national and characteristic desire, or rather craving, for change and novelty, certain it is that sports, pastimes or new methods of recreation, which at the time of their introduction are received with an eagerness which promise permanency, are after all the most ephemeral. The best instances which incur to us at the moment are bicyling and "rinking." Of these the latter has utterly faded out, and the former has but a feeble hold which promises, in spite of all efforts in the shape of exhibitions, challenges, and matches against horses, to follow its example; still there are feeble hopes of its rival which we trust will be fulfilled. A pastime so healthy, so practicable in its pursuit and so utterly free from any demoralizing tendencies, ought not to be suffered to die out. It is to be regretted that our athletic associations have not done more towards supporting and encouraging bicycling, particularly the college associations. It is customary at Harvard, Yale, and elsewhere, for the students to make long expeditions in various directions on foot. How much could the pleasure of their trips be enhanced by the use of the bicycle, any one who has read the correspondence on the subject, embracing letters from collegians in the London *Field*, knows. Routes are therein given, with information as to distances, runs, etc.; and the rate of speed attained, averaging twelve miles per hour, is so great, that places are visited that would be beyond the limits even of a day's drive with horse and wagon.

We have before us the initial copy of *The Velocipedist*, a paper started during the excitement attending the first introduction of the modern bicycle into this country. Of course the old velocipede with its three wheels, two being worked by the arms, was familiar to boys of many generations ago; and even the two wheeler, in which equilibrium was maintained and motion given by the feet paddling against the ground, had long been a familiar object on the streets, and the boy well split up so that he could manage a big machine was the envy of the neighborhood. The latter, indeed was the original form of velocipede, but never came into general use as an instrument of utility. The Baron Drais de Saverbrun, has the credit of having, about the commencement of this century introduced the three wheeled arm movement velocipede, which was first introduced to the Parisians at the celebrated resort known as the Tivoli Gardens. It is certain, however, that many years previous to that time, Messieurs. Blanchard and Mesurier had invented a machine which was exhibited at the court of Louis XVI. At its head was the figure of an eagle with outstretching wings, and while one man directed its movements from in front, another sat behind and propelled it. Subsequently Mr. Drenze improved upon this invention and machines constructed after his model were distributed among country postmen, who used them until a fall of snow caused their abandonment, after which their use was never resumed. M. Lallement was the inventor who affixed treadles to the front wheel, and his first appearance in the Champs Elysees produced n perfect furore. The *velocc* became an "institution" with the Parisians at once, races were organized, school boys, messengers, and pedlers were mounted, and although the first excitement had died out the bicycle remains in constant use. The new fashion was eagerly adopted by England, and in that land of out-door sport the bicyle has become firmly fixed, ranking as an athletic pastime with cricket, foot-ball, or, almost, rowing. The new fashion, of course, soon reached this country and numerous "schools" were started. The stage took up the bicycle, and manufacturers improved upon the European machine. Of late, however, the use of the bicycle has languished. And yet we are not without some very clever riders. Putting aside the professionals who have been made such "examples" of by Stanton, the English champion, we have some good amateur riders, notably Mr. Jas. M. Mason, of Highland, Ohio, who, in October, 1875, rode 99 miles in nine hours and five minutes.

Stanton, since he has been here has beaten all riders and even attempted the feat of riding against a trotting horse. He found, however, that our trotters were very different animals from the "pony" trotters that he had met at Lillio Bridge and Alexandria Park. In the short races, such as five miles, he was of course beaten by a mile or more, but it is questionable whether in a race of one or two hundred miles he would not win against an average trotter. The endurance of man, backed by will and intellect, seems much superior to that of the animal. A mile in three minutes has repeatedly been made in English matches. The Boston *Post*, in an ably written article, advocates the claim of the bicycle as means of recreation between horseback and pedestrianism, and we join with our contemporary in hoping that it may take a final foothold on our soil. The example is set by prominent statesmen and men of letters. Mr. Lowe, ex-chancellor of the British Exchecquer, makes a mile on his bicycle in time equal to any amateur's. Mr. Dana, of the New York *Sun*, is said to be an accomplished bicyclist. The *Post* says:—

"How easy and cheap to take one's bicycle and wheel off into the country in fine weather, compared with carriage or horseback riding. The pleasantest journeys may be made with them. They eat nothing, and require no care after dismounting. There is no danger from accidents, and if weary of traveling in that way the rider could push to a railroad station, pitch his machine into the baggage car and seat himself with the passengers. It may demand more or less exertion to climb the hills that confront one so frequently on New England roads, but it is nothing to steady tramping; it is easier than prolonged horseback riding, and it is far more recreating and refreshing than by the cars. The bicycle is waiting to come in."

CRICKET.

—The cricket season of the Centennial year in the metropolis has opened more favorably than was anticipated, and the promise is that we shall have some very interesting local contests this season. It still remains a discredit to the great metopolis of America that our Central Park, which has on its map a so-called cricket field, has no such resort in reality, the rule prohibiting all sports and pastimes at the park in question, except to a very limited extent, preventing the city clubs from having any facilities granted them to play cricket at the park. It has been found necessary to have fields for athletic exercises, and there ought to be a regular metropolitan cricket field, similar, in fact, to such a ground as "Lord's" in London. In the meantime, however, we have to take what the gods—democratic—grant us, and that is simply the old field at Hoboken, which this year, by-the-bye, is in better condition and order than it has ever been seen before, thanks to the attention given it by the St. George Club's worthy professional, Mr. George Giles. The cricket season opened there on Decoration Day, when the Merions, of Philadelphia, visited the St. George gentlemen and had a pleasant four-innings game on that day, the result of which may be summarized as follows: St. George—first inning, 88; second inning, 83; total, 171. Merion—first inning, 48; second innings, 69; total, 116. Best scores by St. George—Soutter, run out, 29; Giles, not out, 27; Marsh, 17; Gibbes, 16; Richardson, 15; Mocran, 11. Best scores by Merion—Williams, 23; Harnes, 17; Wam, not out, 11; Ashbridge, 10. Best bowling by St. George—Marsh 4 wickets for 13 runs. By Merion—Fox, 8 wickets for 41 runs.

Since this game the St. George Club have had pleasant meetings with the Staten Island and Stevens Institute eleveus, they defeating the Islanders, but being beaten by the Institute yonths. They of course did not present their full strength against the latter, but the team they did put in enabled the boys to win a creditable victory, which will greatly help them to become more practiced cricketers.

—The Manhattan Club are on their feet again, thanks to the liberality of Chief Engineer Acly en, of Prospect Park, where the club now practices every Saturday.

—The Prospect Park Club has not shown up this season as yet. Probably they will find it advisable to play under the new park rules.

BASE BALL.

—The model games since our last include the following:—

June 10—Mutual vs. Cincinnati, at Brooklyn (10 ins).....	1	to 0
June 6—Mutual vs. Cincinnati, at Brooklyn.....	2	to 0
June 6—Louisville vs. Boston, at Boston.....	3	to 0
June 8—Louisville vs. Boston, at Boston.....	3	to 1
June 8—Chelsea vs. Alaska, at Brooklyn.....	4	to 1
June 7—Rhode Island vs. Taunton, at Providence (17 ins).	4	to 2
June 10—Louisville vs. Boston, at Boston.....	4	to 3
June 3—Cincinnati, of St. Louis, vs. Active, at St. Louis.	5	to 4
June 8—Star vs. Mechanic, at Rochester	6	to 1
June 4—St. Louis Reds vs. Stocks, at St. Louis.....	6	to 2
June 5—Continental vs. Brooklyn, at Prospect Park.....	6	to 3
June 7—Hartford vs. St. Louis, at Hartford	6	to 3
June 10—Hartford vs. St. Louis, at Hartford (7ins).....	7	to 0
June 6—Chicago vs. Athletic, at Philadelphia.....	7	to 0
June 6—Amity vs. Active, at Greenfield, N. J.....	7	to 1
June 4—Olive vs. Blue Stockings, at St. Louis.....	7	to 4
June 9—Mutual (amateurs) vs. Fly Away, at Gapitoline.	7	to 4
June 9—New Haven vs. St. Louis, at New Haven...	7	to 5
June 6—Hartford vs. St. Loois, at Hartford.....	8	to 4
June 7—Alaska vs. Active, at Hoboken.....	8	to 4
June 8—Bridgeport vs. Yale, at Bridgeport.....	8	to 6
June 8—Chicago vs. Athletic, at Philadelphia.....	8	to 7
June 10—Winona vs. Staten Island, at Staten Island.....	9	to 2
June 10—Princeton vs. Chelsea, at Brooklyn.....	9	to 4
June 5—Olympic vs. Resolute, at Paterson.....	10	to 4

—The most remarkable contest on record was that played June 7th at Providence between the Taunton nine and the Rhode Islands, the full score of which we place on record, no less than seventeen innings being required to settle it:—

OUR PHILADELPHIA LETTER.

PHILADELPHIA, June 12th, 1876.

ON Saturday, 10th inst., the match between the Merion and Germantown Cricket Clubs resulted in a handsome and hardly expected victory for the Merions by a majority of 45 runs. By excellent bowling and good field ing they held the Germantowns down to 111 runs, and then by hard hitting, assisted by very loose fielding, piled up a score of 156. Large, of the Germantown, put together 34 neatly. John Hargreaves carried his bat out for 10, while two more of the same family—Joe and Bob—had 16 and 11 respectively. For the Merion, G. Ashbridge, after giving a number of chances, went out for 57 runs. Law, who made a long leg hit for 4, added 33 to the total. Haines made 26, and Fox 14.

The game between the Young America vs. Germantown Clubs, begun on the 3d inst., was resumed to-day, the 13th, at half-past one, with John and Joe Hargreaves again at the bat, the former having been "not out" with 16 runs, and the latter ditto with 7. The two brothers, after each having been given a life, made a stand. For a time the run getting was fast, principally from Joe's bat, when he went out with 43—nine twos, two threes, one four, one five off a magnificent leg hit, and the balance singles. John plodded on slowly until he had 26. Nearly every man on the eleven had double figures, even extras. When the last wicket fell the score for the innings was 183. The game now looked like a foregone conclusion, but the Young America sent in Dan and Bob Newhall to face Welch and Bob Hargreaves. The bowling was handled for ones and twos at a rate which led to Caldwell's replacing Welsh, and then to Brewster's taking Caldwell's place. When Dan was out, leg before wicket with 11 runs, the telegraph showed 50 for one wicket. George Newhall joined Bob, and made two fours, one three, and two singles in quick succession, and when half-past six came and the stumps were drawn, the Young America had 67 runs for one wicket, leaving them 9 wickets in which to make 104 to win. The conclusion will be on Wednesday next, the 14th. SCULLS.

The Rifle.

RIFLE NOTES.—The joint committee of the National Rifle Association and Amateur Rifle Club have resolved to send circulars to the various rifle clubs throughout the country soliciting contributions to defray the cost of the grand trophy for the world's championship....The percentage of the scores in the first competition for places on this year's team was higher than that attained last year....The competitions of Tuesday and Wednesday determined the twelve who are to compose the team and reserve. The competing eight will be elected by a majority of the twelve at such time as they themselves may determine upon....At the last monthly meeting of the directors of the National Rifle Association, a letter was read from Sir Henry Halford, of the English Rifle Association, regretting that the English marksmen could not join in the Centennial match. They could not overlook the unity of Great Britain by placing themselves in antagonism to their fellow countrymen in an international contest of this kind. Also one from Captain Macdonald, of the Scotch team, asking whether his team could be accommodated with a camping ground near the range, and stating that the team would leave Liverpool on the steamer Bothnia on the 19th of August. They wish to camp on or near the range from their arrival up to the time of the match....An organization called the Creedmoor Building Association has been formed, its immediate object being the building of a club house at Creedmoor. The National Rifle Association will purchase the building when it is completed....The conditions of two coming matches have been announced—the match for the badge presented by Mr. Poppenhusen, on behalf of the Long Island Central Railroad, to be shot for on the 24th inst., and the Schuyler, Hartley & Graham prize for rapid as well as accurate firing. For the former the distances are to be 200 and 500 yards, two sighting and five scoring shots at each distance; weapon, Remington rifle, State model. The highest score wins the badge and one fourth of the entrance money; the next highest to get one sixth of the entrance money, and the third one twelfth of the same. The other prize mentioned is open to all comers, and will be shot for, off hand, at 200 yards, with any rifle, as many shots being allowed as a man may choose to fire in thirty seconds. The highest score wins the badge and half the entrance money, and the other half is divided between the two marksmen scoring next highest.

CREEDMOOR.—The only match shot at Creedmoor on Saturday was the short range contest for the *Turf, Field and Farm* badge, the conditions of which are ten shots each at 200 yards off-hand. The wind was very bad for good shooting blowing in gusts across the range. There were thirty competitors, the winner being Mr. A. Pyle, who used an ordinary military rifle. The names of those who scores above 30 were a follows:—

Name.	Total.	Name.	Total.
Alexander Pyle.....	40	G. L. Morse.....	37
C. H. Eagle.....	39	J. F. Irwin.....	36
W. H. Cochran, Jr.....	38	S. Sargent.....	36
J. L. Price.....	38	George Waterman.....	35
H. P. Carrington.....	38	C. E. Latimer.....	35
J. L. Allen.....	38	C. A. Rouller.....	23
R. H. Keene.....	37	Capt. C. F. Robbins.....	33
Col. Valentine.....	37	Capt. W. C. Reddy.....	32
C. E. Huntington.....	37	Capt. C. E. Truslow.....	32
J. L. Kellinger.....	37	D. F. Davids.....	31

THE TEAM COMPETITIONS.—The last two stages of the second competition for places on the American team were shot at Creedmoor on Tuesday and Wednesday of last week, and the sixteen men making the highest aggregates were named for the final competitions, which were shot on Tuesday and Wednesday of this week. The aggregate scores made by the contestants, with four competitions, were as follows, the possible score being 1,000:—

Name.	Total.	Name.	Total.
General T. S. Dakin.....	835	E. Overbnogh.....	767
Frank Hyde.....	832	T. D. Gray.....	765
G. W. Yale.....	829	E. H. Raymond.....	762
Colonel W. B. Farwell.....	796	H. Fulton.....	756
A. Anderson.....	794	C. Dusenbury, Jr.....	755
R. Rathbone.....	785	W. D. Emmendorf.....	753
L. Weber.....	780	R. S. Gray.....	745
H. S. Jewell.....	776	L. L. Allen.....	725
L. C. Bruce.....	772	Orange Judd.....	721
W. Washburn.....	770	G. E. Blydenburgh.....	722
J. A. Shaffer.....	770		

From the first sixteen who were to have shot yesterday, four more were to have been eliminated, leaving the team and reserves of twelve men. It was proposed by Col. Gildersleeve to have the last competition determine not only whom should constitute the twelve, but that the men making the best eight scores should compose the team, and the other four the reserve. It was finally decided, however, that the twelve should remain an open squad to be divided into team and reserve at a certain time before the end

—At the shooting tournament on Union Hill, N. J., Mr. J. F. Ruthyen, on Monday, made the largest score on record, distance 200 yards, five shots, viz., 48 out of a possible 50. Mr. Ruthyen is one of the best off-hand marksmen in the United States.

MASSACHUSETTS.—The members of the Worcester Sportsman's Club held the first of their competition trials to select a club team, Thursday 8th inst. The distance was 800 yards, in any position, without artificial rests, at a Creedmoor target. The result was as follows: Highest possible score 75.—

Name.	Total.	Name.	Total.
A. G. Mann	57	A. L. Price	48
Steadman Clark	47	G. J. Rugg	46
A. P. Cutting	42	A. E. Grimer	36
Frank Wesson	21	A. F. Hatch	17
C. B. Holden	15		

CONNECTICUT.—The members of the Connecticut Rifle Association held their regular weekly meeting on the 10th inst at the Willow Brook range. The wind was unfavorable. J. B. Rowe won the long-range medal a second time, and consequently it becomes his property. It was originally won by G. W. Yale; the second time by Mr. Rowe, and the third time by Captain Stetson. A similar one will be immediately obtained in its place. Captain Stetson won the mid-range (five hundred yards) medal, making a score of 33 points, the highest possible being 35. Annexed are the scores, fifteen shots each.—

Name.	800	900	1,000	Total.
J. B. Rowe	22	12	13	47
J. E. Stetson	13	11	13	37
J. L. Woodbury	13	11	withdrew.	24
Orange Judd	12	06	05	23
J. C. Kinney	08	03	withdrew.	11

The other contestants withdrew after shooting at the eight hundred yard range. The two hundred yard medal was won by J. L. Woodburry, of Hartford;

ILLINOIS.—The 8th was a regular practice day with the members of the Chicago Rifle Club, and a few of the long range riflemen assembled at South Park to try conclusions at 800, 900 and 1,000 yards. The latter range, however, on account of the inclemency of the weather was not attempted. Fifteen shots per man were fired at the first two distances, and the following scores made out of a possible 75 at each range :—

Name.	800 Yd's.	900 Yd's.	Total.
James Smith	55	51	106
O. C. Blackmer	56	57	93
A. W. Roberts	34	44	78
A. G. Alford	53	23	75
H. W. S. Cleveland	43	30	30
Charles Fuller	31	4	35

The club will hereafter meet every Thursday for long range shooting, and it is hoped more members will be present.

Game Bag and Gun.

PIGEON MATCHES.

CENTENNIAL SHOOTING TOURNAMENT.—A grand prize shooting tournament will be held under the auspices of Capt. Bogardus and Miles Johnson at Philadelphia, on July 5th, 6th, and 7th. The prizes will be $500, $680, and $1,000, for the three days divided into five classes, the first two days being open to amateurs only, entrance, $10, and the third to the world, entrance $20. On the 4th of July Capt. Bogardus will shoot an exhibition match, to break 1,000 glass balls thrown up at 25 yards from spring traps or by hand, two balls to be in the air at the same time and match to be shot in two hours and forty minutes.

MINNESOTA.—The match between the St. Paul Sportsman's Club and the Stillwater Club for the championship badge was shot at Stillwater on the 2d inst. and resulted in a defeat of the St. Paul Club by one bird. The scores made were as follows, the shooting being at 20 birds each, and under the usual conditions.—

Love	1	1	0	1	1	*0	1	1	1	0	8
Potts	0	1	1	0	0	1	*0	1	1	1	6

* Dead out of bounds. L.

CONNECTICUT, — Woodcock are reported to be very plenty this year, and it is due probably to the law passed last year abolishing summer shooting; but it seems that there are some sportsmen who desire a repeal of the law, for a petition for a new game law has been put in circulation in New Haven and has, so it is said, received over 500 names including many prominent sportsmen. It provides for the shooting of woodcock from July 1st to January 1st, excepting only August and September.

SPORT IN THE WEST—DANE'S GUN.

LA CROSSE, Wisconsin, June 7th, 1876.

EDITOR FOREST AND STREAM:—

In this wide-awake thoroughly western city, we have been happily spending the last few weeks, visiting old friends, making new acquaintances and enjoying city life generally as one who has spent three years "in the timber" is well fitted to do. La Crosse is quite a sporting town, several very fine dogs are owned by well known citizen. "Czar," a direct descendant of Rake and Rachel, owned by Mr. Webb, of the American Express Company, to whom we are under obligations for many favors, being one of the best. Mr. Webb informs us that the fall woodcock shooting on the Mississippi River bottoms here is as good as can be; that a party from St. Louis came here every fall in a small steamer, the Fire Fly, on purpose to shoot woodcock for the St. Louis market, and that they express the birds "by the barrel full." Surely it would pay some ardent devotee of cock shooting to "take in" this point this fall, then cross the river into Houston Co., Minn., where Chief of Police Frank Hatch, (one of your subscribers and correspondents, by the way,) informs us there "are more quail than any where else in the world."

Quite naturally we drifted in our wanderings about town into the gun shop of J. C. Dane, where we have spent more than one entertaining hour, learning something about guns from this fine mechanic, and learning also that Mr. Dane is building guns second to none made in the country, and as we think, in all essential points superior. These guns are fitted up with Dane's patent snap action, and patent firing pin; there is no lever in sight; the unlocking of the gun is accomplished by pressing backwards the patent finger piece which forms the fore-part of the guard, and it is a very simple, natural motion to make, and requires but little more force than is needed to pull a trigger, and the motion in character is precisely similar. This motion unlocks and breaks down the barrels, and when snapped back and ready for firing, the gun looks like a muzzle-loader, no unsightly and unhandy lever being in the way.

A second and noteworthy improvement is Dane's patent self-recoiling, or momentum firing pin, which entirely precludes any danger from accidental discharge, it is impossible to explode the charge by accident or carelessness, and the working of the lock and firing pin should be seen to be appreciated. Justice cannot be fully done it on paper. Dane builds these guns of all grades from $75 to $300; does his work all by hand, elegant work it is too, tests each gun personally until it suits him fully, and fills the order to the letter, and warrants them in every particular. It strikes us that a stock company could take hold of this gun and patents and make money out of it. For strength, general shooting qualities, ease in handling, simplicity of construction, it certainly "lays over any gun we have ever seen or handled. T. P. C.

FLANNEL SHOT CARTRIDGES.

LAWRENCE, Kansas, June 3d, 1876.

EDITOR FOREST AND STREAM:—

Have just read "Wing Shot's" experience with flannel cartridges in No. 17, and as I think my suggestion, in February, of the merits of the "flannel" system of choke boring was the first to appear in FOREST AND STREAM, though I fancy old to most sportsmen of experience, I will suggest my way of making them. I use flannel because cotton or linen is apt to burn, and if there is dead grass the possible result is not pleasant. Take a strip 16 to 18 inches long, and of a width equal to the circumference of the bore of the gun; then sew the edges together at one end, then pour in a charge of shot, using a small funnel, which is always handy in loading, then tie above the shot closely with strong thread, and again one quarter inch above, then another charge, tying as before. When the end is reached you have ten or twelve charges, only needing to be cut apart between the two ties. Quite thin flannel should be used, or the charge will be solid. The material called merino is about the right texture. This is the cheapest and best concentrator I know. Kay's is expensive, and, I find, very irregular. I have tried 100, and at least one half went solid, so that in using up what I had left I cut off the crease, so as to make them burst. For long shots, no choke boring can do better than charges loaded as I have indicated. W. A. HARRIS.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

NEW YORK YACHT CLUB REGATTA.—The ill luck of the New York Yacht Club on its regatta days in always having what the log books call "light winds and calms," is proverbial. But for once either the clerk of the weather or the regatta committee made a mistake, and fortunately pitched upon a day which could not have been improved on, the result of which was that the regatta was one of the most successful ones which ever occurred in this harbor. There were a few mishaps it is true, as will appear lower down, but these were but the spices which gave flavor to the feast; both wind and weather were all that could have been desired. It was about ten o'clock when the steamer Wm. Fletcher, having on board the judges and members of the press, arrived off the club house at Staten Island, followed by the club steamer Wm. Cook, and the excursion steamers Magenta, Cyclops, and others, all with full freights. Here the contestants, together with a fleet of yachts not entered in the regatta were found sailing about or at anchor, awaiting their instructions and the signal guns. At nineteen minutes past eleven the first gun was fired, and the fleet being under way, ten minutes later the gun was fired for the yachts to pass the line between the judges' steamer and the club house, and the schooner Meta being nearest dashed across followed by schooner Meta being nearest dashed across followed by the others in quick succession. The names of the contending yachts and their respective times of crossing are given below:—

Windward	H. R. Willoughby	11	43	17
Madcap	J. H. Busk	11	43	17
Breeze	H. P. Kingsland	11	34	04

The Palmer and the Arrow having passed between the judges' boat and the stake-boat somebody called to them to go back and pass inside the stake-boat, which they did, although according to the printed sailing directions they were quite right. The Wanderer did not pass the line until after fifteen minutes' limit had passed, and was therefore ruled out of the race. The wind was blowing a good topsail breeze from the southwest, enabling those of the yachts that had started with sheets well in to almost lay a course for buoy No. 10. So long a start had the yachts been given that the leaders had almost reached the first turning point before the Fletcher came up with them. The picture was a glorious one after the Narrows had been passed and the fleet were all in view. The Meta had been deprived of her lead by the sloops Gracie and Arrow, and the schooners Idler, Palmer and Madeleine had also passed her. The race between the two sloops just named was very exciting. Both had to tack to weather the buoy, and although the Gracie had the lead she stood on much further than was necessary, allowing the Arrow to round first. The sailing of this sloop was remarkable throughout the day; she had beaten the Meta twenty-two minutes to the southwest spit, rounding that point at 12:54.39. The Gracie followed about a minute later, and in two minutes the huge Idler rounded in grand style, sending up a balloon jib which was destined soon to be on deck again. After an interval of six minutes, and closely following each other, came the schooner Palmer and sloops Vindex, Coming, and schooners Madeleine, Meta, and Comet; then the sloops Addie V. and Active, and the schooners Peerless and Restless almost side by side. The little Madcap came next, and then the schooner Tidal Wave sent up a balloon jib; and she waited a few minutes longer she would not have been minus a jib-boom, as the strain being too great for that spar it snapped with a loud report, and the schooner was disabled for the rest of the day. As the judges' boat steamed up to the point of the Hook to catch the leaders, we could see the white caps breaking inside showing that there was more wind and plenty of sea. As the fleet reached out from the Hook the fresh southerly wind was met, which, together with a strong ebb tide, made a sea that was too much for many of the yachts. In fact, it was the sea which caused most of the mischief, as there was not more than a good whole sail breeze. Never was a transformation more suddenly effected. The dainty yachts which were but a few minutes before clouds of canvas, were suddenly stripped for business, the schooners to three lower working sails, and the sloops to jibs and mainsails, with single reefs in some of the latter. The Alarm in pitching into a heavy sea carried away her fore topmast, and her chances were destroyed. The schooner Peerless was almost the first to turn about and give it up, followed by the sloops Addie V. and Gracie. Down to leeward a large schooner which afterwards proved to be the Madeline, was seen with the head of her mainmast carried away just below the cap. Away astern the like huge Mohawk, not entered in the race, known by her square sail yard, had been coming proudly through the fleet with both gaff topsails set, standing up like a house, when suddenly, away goes her mainsail, the sail parting across the head just under the gaff, leaving that spar standing with a fluttering mass of ribbons attached to it. How the accident happened is unexplainable, as there was scarcely wind enough to carry away a top-sail much less such a sail as the Mohawk's mainsail. The sloop Vindex kept on and the three great schooners, Rambler, Wanderer, and Tidal Wave, came on together, with the Restless and Clio to windward of them. The Tidal Wave did not at this juncture feel the loss of her jib boom, although she sadly wanted it on the run home. Of the second class sloops the Active with her huge topmast found too much sea and went back, but the little Madcap and the Windward, with topmasts housed appeared to be making good weather of it and pluckily kept on. There was more sea than the Fletcher could stand, so after sighting the light ship and timing the Idler, Palmer, Arrow, Comet and Vindex as nearly as could be she was headed for the home stake boat in order to take the time at the finish. It was a tight race between the Idler and the steamer, the yacht beating but only by a minute or two, her time being obtained accurately. The yachts came straggling along at short intervals, their times being as follows:—

KEEL SCHOONERS.

Name.	Start.	Finish.	E. Time.	Cor. Time.
Rambler	11 38 43½	3 52 55	4 14 11½	4 14 11½
Alarm	11 39 36½	4 07 53	4 28 16½	4 27 54½
Wanderer	11 48 02	3 51 17	4 03 15	3 59 23
FIRST CLASS CENTREBOARD SCHOONERS.				
Palmer	11 41 36	3 38 58½	3 57 22½	3 57 22½
Idler	11 36 11½	3 31 00	3 54 48½	3 51 22½
Tidal Wave	11 35 50	4 00 55½	4 25 05½	4 23 23½
Madeleine	11 40 27	dismasted.		
SECOND CLASS C. B. SCHOONERS.				
Restless	11 34 12½	4 10 58	4 36 45½	4 36 45½
Estelle	11 35 14	4 05 07	4 29 53	4 28 38
Comet	11 41 21	3 46 48½	4 05 27½	3 58 14½
Peerless	11 43 42½	withdrawn.		
Clio	11 42 25	4 07 17	4 24 25	4 11 54
Meta	11 29 47	4 07 08	4 37 21	4 23 58
FIRST CLASS SLOOPS.				
Arrow	11 41 02	3 52 33	4 11 30	4 11 30
Gracie	11 36 27½	withdrawn.		
Vindex	11 37 20½	4 25 15	4 25 54½	4 21 14½
Adie Voorhis	11 38 19	withdrawn.		
SECOND CLASS SLOOPS.				
Coming	11 38 10½	withdrawn.		
Active	11 38 10½	4 35 30	4 57 19½	4 57 19½
Windward	11 43 17½	4 31 59	4 48 41½	4 48 08½
Madcap	11 43 11½	4 31 53	4 48 41½	4 48 16½
Breeze	11 34 04½	withdrawn.		

Thus the Rambler wins the keel schooner prize; the Idler the first class schooner prize, beating the Palmer by exactly six minutes; the Comet the Bennet Challenge Cup for schooners, beating the Idler by 5m. 53s., and the second-class schooner cup, beating the Clio by 12m. 9½s.; the Arrow the Bennett Challenge Cup for sloops, beating the Vindex by 9m. 34½s., and the first class sloop cup, beating the Vindex the same time; and the Madcap the second class sloop cup, beating the Wiudward by 4m. 52s.

There was nothing on the Bay on Thursday that sailed better than Mr. Astor's Atalanta. The sloop Vision was also out but not entered. The time made by the Idler is the fastest ever made over the course. On such a day she would prove a safe champion in the race for the American cup.

BROOKLYN YACHT CLUB REGATTA.—Saturday was even a more favorable day for a regatta than Thursday, as there was quite as much wind without the troublesome sea outside the Hook, which on Thursday did so much to upset the equanimity of both yachtsmen and spectators. Of the vessels entered, the Madeleine and Tidal Wave, in the first class, having both been disabled in Thursday's race, were necessarily absent. So also were the Playful, Siren, Mystic, and Clio, but for what reason is unknown, unless it was that their owners knew the uselessness of contending against the Comet. The course for schooners and first class sloops was from the stakeboat off Bay Ridge to Southwest Spit, around the Lightship, back to Southwest

Spit, and home to a stakeboat off the new club house in Gravesend Bay. The second class sloops sailed the same course, substituting the Gedney Channel bar buoy for the Lightship, and the third class went direct from the starting point to a stakeboat anchored in the Horseshoe, two miles south of bouy 8½. The starting yachts were as follows:—

SECOND CLASS SCHOONERS.

Estelle—J. B. Smith,	Comet—W. H. Langley,
Louise—N. P. Rogers,	Gypsey—H. T. Livingston.

FIRST CLASS SLOOPS.

Gracie—J. R. Halsey,	Arrow—D. Edgar,
Undine—W. M. Brasher,	Kate—G. F. Randolphe.

SECOND CLASS SLOOPS.

Pirate—J. S. Beecher,	Lizzie L.—J. S. Johnson,
America—J. I. Treadwell,	Selene—H. S. Wood.

THIRD CLASS SLOOPS.

Cynthia—E. P. Miller,	W. T. Lee—C. A. Cheever,
Victoria—Thos. Fry,	Susie S.—E. P. Miller.

At 11:37 the first gun was fired, and at 11:34 the signal was given to cross the line. The Arrow was first over, followed by the Comet and the Katie side by side. Next came the Gypsey and Louise, and then the Estelle, Gracie, and Selene, followed by the Undine and the William T. Lee. Close behind the Lee came the America, followed by the Susie S., Pirate, Lizzie L., and Victoria. The wind was light, but the yachts had a fair tide. The Arrow had a long lead, with the Comet after her. The Estelle was almost becalmed under the Staten Island bluff, having gone too far over to that shore, and the time thus lost was fatal to her chances, as the other schooners, when once outside the Narrows, went off with a rattling breeze, and were down to the Quarantine island before the luckless Estelle drifted out and caught the breeze. At 12:30 the Arrow tacked, followed by the Comet eight minutes later. The breeze had now freshened so much that club topsails were taken in and working ones substituted. The leading yachts reached the Southwest Spit in the following order:—

Name.	H.	M.	S.	Name.	H.	M.	S.
Arrow	1	28	59	Gracie	1	45	25
Comet	1	36	41	Undine	1	47	30

The rest were not timed, as it was necessary for the judges' steamer to go on for the Lightship to time the leaders. There was still more wind outside, but it was not so rough as on Thursday. The Comet gained on the Arrow, but the latter rounded the Lightship first at 2:24.12, the Comet's time being 2:27:02, and the Estelle's 2:42:30. Running in for the Hook, the Comet finally passed the Arrow, and turned the Spit buoy ahead of her. From here it was a run before the wind for home, and kites were piled on. The following table gives the result of the race:—

SECOND CLASS SCHOONERS.

Name.	Start. H.	M.	S.	Finish. H.	M.	S.	Elapsed Time. H.	M.	S.	Corrected Time. H.	M.	S.
Estelle	11	51	47	4	40	55	4	49	48	4	52	28
Comet	11	47	21	4	13	03	4	25	22	4	25	46
Gypsie	11	50	45	4	59	05	5	08	21	5	03	49
Louise	11	50	41	Did not go round.								

FIRST CLASS SLOOPS.

Gracie	11	53	30	4	29	50	4	36	20	4	34	07
Arrow	11	46	13	4	16	27	4	30	14	4	24	33
Undine	11	56	24	4	42	38	4	46	14	4	32	09
Kate	11	47	22	4	45	31	4	58	09	4	41	38

SECOND CLASS SLOOPS.

Pirate	11	59	44	4	51	43	4	51	59	4	51	59
America	11	58	26	4	22	41	4	24	15	4	21	19
Lizzie L.	12	01	26	4	15	43	4	14	17	4	10	32
Selene	11	55	35	Turned back.								

THIRD CLASS SLOOPS.

Cynthia	12	00	13	3	45	38	3	45	25	3	45	25
Victoria	12	01	47	4	14	47	4	13	00	4	10	00
Wm. T. Lee	11	58	09	3	41	58	3	43	49	3	39	39
Susie S.	11	59	28	3	39	18	3	39	50	3	35	30

Thus the Comet wins the club prize for second class schooners, beating the Estelle 26m. 42s. The Estelle wins the Flag Officers' prize in this class, beating the Gypsey 10m. 21s. No first class schooners were started. The Arrow wins the club prize for first class sloops, beating the Undine 7m. 36s. The Undine wins the Flag Officers' prize in this class, beating the Gracie 1m. 58s. The Lizzie L. wins the club prize for second class sloops, beating the America 10m. 47s. The America wins the Flag Officers' prize in this class, beating the Pirate 30m. 40s. The Susie S. wins the club prize for third class sloops, beating the William T. Lee 4m. 9s., and the William T. Lee wins the Flag Officers' prize in this class, beating the Cynthia 9m. 55s.

SEAWANHAKA YACHT CLUB.—The Corinthian race for sloops belonging to this club was also sailed on Saturday, under the same favorable conditions which attended the Brooklyn club. The course was from a starting point off Fort Wadsworth to and around the Lightship and return over the same course. The following table shows the time of starting and fiuishing:—

Yachts.	Started. H.	M.	S.	Finished. H.	M.	S.	Corrected. Time. H.	M.	S.
Coming	11	43	50	4	25	35	4	31	55
Addie	11	43	20	4	25	45	4	32	11
Vindex	11	45	00	4	30	05	4	30	49
Madcap	11	43	33	4	42	10	4	34	38
Active	11	44	30	4	42	22	4	39	45
Windward	11	42	10	4	42	59	4	41	50
Sadie	11	46	50	4	45	18	4	37	55
Scamper	11	51	40	4	59	08	4	39	28

The Coming was first around the buoy and Lightship, but the Addie Voorhis pushed her very close on the home run, and finally passed her, coming in ten seconds ahead.

The Vindex was adjudged the winner of the first prize for first class yachts, and no second prize was awarded. The first second class prize was awarded to the Madcap, and the second to the Sadie. The prizes were elegant silverware. The only accident during the race was a momentary "foul" at the start between the Addie Voorhis and the Coming, and the carrying away of a spar from the Vindex on the home stretch. The whole regatta was admirably managed, and its conduct elicited many commendations from the spectators. The Brooklyu regatta was so nearly on the same course that the vessels were much intermingled, and one could most of the time note the progress of both regattas.

THE CENTENNIAL YACHT RACE.—Entries for the second day's race must be made to Mr. J. M. Sawyer, No. 85 South street, before noon June 22d. Yachts will be classified as follows:—

First Class—All cabin sloops under 15 tons, old New York Yacht Club measurement. Second class, all open yachts over 25 feet mean length. Third class, all open yachts of 25 feet mean length and under. Fourth class, all open yachts carrying pleasure or working sails. No restrictions as to sails for first class. Second and third class to carry jib and mainsail only. Fourth class will be restricted to working jib and mainsail, but may carry light sails. Time allowance will be based on length only for all classes, one-half of overhang included in measurement. The allowance will be two minutes to the foot in mean length.

Prizes—Medals and diplomas of the Centennial Commission and silver prize of Centennial Regatta Commission.

NASSAU BOAT CLUB.—The annual spriug regatta of this club was held on the Harlem on Saturday. Four races were on the programme, but only two were contested. Of them the first was for junior single sculls, one mile straight away. There were three contestants—James D. Fort, Wm. Robinson, and A. L. Heyn. Fort took the lead at the start, with Robinson second, the same order was continued through the race, Fort winuing by three lengths from Robinson in 6m. 25s. The prize was a silver cup presented by Mr. Daniel Appleton.

The second race was for pair oars, in which there were three entries. The crews were: Red—Frank G. Brown, bow, and John A. Walker, stroke; Blue—J. B. Robert, bow, and Lindsey Watson, stroke; White—A. B. Frost, bow, and G. S. Floyd-Jones, stroke.

Red led at the start, but blue came to the front after the first quarter, while White ran aground and was out of it. Red steered wild, and subsequently withdrew, leaving Messrs. Fort and Floyd-Jones to go over the course alone, which they did in 7m. 30s. against wind and tide.

COLUMBIA BOAT CLUB.—This Brooklyn club held its annual regatta in Gowanus Bay on Saturday. There was but one race—that between four-oared gigs—the course being from Delaplaine Point to a point below Bay Ridge, distant two miles and a quarter straightaway. The names of the crews are as follows:—

Dixie—Red.—J. S. Stokes, bow; C. O. Lewis, No. 2; W. J. Bruff, No. 3; R. Bleecker, stroke; P. E. Robinson, coxswain.

Dandy—Blue.—L. Avery, bow; H. H. Leland, No. 2; C. W. Lippitt, No. 3; H. T. Dunham, stroke; S. B. Hazard, coxswain.

The water was rather lumpy for shells, a considerable quantity of water at times coming inboard. The Dixie had the lead at the start, and the Dandy was unable to come up with them, the first named winning by twelve seconds in 15m. 33⅘s.

NEPTUNE ROWING CLUB.—The Neptune club of West Brighton, Staten Island, had their regatta on Saturday. There were four races on the card, all one mile and return. The first race was begun at four o'clock, the entries being as follows, the captain of the Nautilus club acting as referees and Walter Mann as timekeeper:—

Name.	Handicap.	Boats.	Weight, Pounds.
Robert L. Lefman	70 seconds	Aonie	152
T. R. Keator	30 seconds	Isaac Smith	173
James H. Riley	Scratch	H. P. Delafield	168

Lefman was sent away first, Keator forty seconds after, and Riley thirty seconds after Keator. Keator overtook Lefman at the stakeboat, when he unshipped his sliding seat and withdrew. Riley caught Lefman halfway home, and came in winner of the race in 16m. 18s. The entries for the second race were:—A. C. Sharp, A. B. Shand, and W. L. James. The latter had the lead until the stakeboat was turned, when he was passed by the other two, Shand coming in ahead in 19m. 16s., Sharp being twelve seconds later. The next race was for barges, in which the Judy, steered by Mr. Edward Smith, beat the Punch in 16m. 34s. The last race was between J. H. Riley, in a single shell, and a four oared crew, comprised of A. Bodine, bow; H. Martin, No. 2; W. Donald, No. 3; A. Childs, stroke, and B. S. Beckwith, stroke. They started two minutes before Riley, who waited on them until they were "pumped," and then spurted in ahead; time, 18m. 6s.

—We are to have something of an Intercollegiate race after all. Trinity College, Cambridge, has officially accepted the invitation and will send a four.

STILL ANOTHER PORTABLE BOAT.—Portable boats multiply. We have received from J. H. Rushton, boat builder of Canton, St. Lawrence county, New York, whose advertisement we print, photographs of a boat built by him for parties in Louisville, Ky. It is built on the same general plan as his other styles of boat, but is lighter in weight, and cheaper. Its dimensions are as follows.—Length over all, thirteen feet; width amidship on top, twenty-eight inches, at bottom of top streak, thirty inches; depth amidship, eleven inches, at ends, twenty-one inches; weight, without seats, thirty-five pounds. Boat to be decked over with canvas. Copper fastened, and without seats or any fixings, it ought to bring $50 in order to pay. Such a boat as this, we think, would be much sought for by all living on or near lakes or streams. They are built on a keel—a piece of oak 1x1⅛ inches, rabbitted to receive the siding, which is of cedar, three sixteenths to one fourth inch thick. The stems are oak or elm, bent; ribs, oak or elm, three sixteenths to one fourth inch thick, and one half to five eighths inch wide, made oval, and are put in the boat one and a half inches apart. Three heavier ones are put in where the row locks come. Being lapstreak, eight to ten boards on a side, and ribbed so closely, makes them very strong for their weight, which is less than any other boat of like capacity, unless it be a birch canoe; and being very flat on the bottom are very steady and have great carrying capacity, and will run in very shallow water. They are well turned at the ends, both being alike, have considerable sheer, which gives them a trim, jaunty appearance on the water, and at the same time enables them to live in very rough water for boats so small and light.

A MODEL BOAT.—Wm. E. Bowditch, the popular florist at Grove Hall, Dorchester, Mass., has had a model boat built this season on an entirely new style. Starting from an oak keel, strips of pine three-quarters of an inch in thickness are nailed on one another until the sides were twenty-two inches high and twelve and a half feet long. The model is sharp at bow and stern. Her rig is of two styles—as a sloop and cat rigged. When used as a sloop her mast and boom, each thirteen feet long, are joined so they can be taken apart and stowed beneath her floor when not needed. A neat Italian awning can be spread when required. She has Grane's patent rowlocks, so that there will be no chance of losing an oar. She is fastened with composition nails throughout, and all her metal works are brass. Her weight is only 160 pounds, and she is intended for river navigation principally. The boat was built by Mr. George W. Wood, and is a decided credit to him and its owner. It is Mr. Wood's first attempt at boat building, and attracts deserved attention from all for her beauty and neat finish. Two men took her to the water one day last week, where she floated in a manner perfectly satisfactory to all.

The Horse.

BALKING.—As to the matter of "balking," no general direction can be given, or rule established. If the education of the colt has been conducted in accordance with correct principles, he will not balk. Balking on the part of colts is, for the most part, the result of the trainer's ignorance or passion. Yelling and whipping on the part of the trainer or driver, overloading, sore shoulders, or ill-fitting collars—these are the causes that make horses balk. But if you have a horse or colt that balks, while one cannot, without a personal knowledge of the subject, tell you what to do, we can tell you what *not* to do—never whip. If he won't go, let him stand still and think it over. He will very often think better of it, and after a few moments' reflection, and a few tosses of the head, go on of his own accord. Or, if this does not answer, get out of the wagon and pat him, and talk to him kindly. A horse is very susceptible to kindness; and we have known more than one quite vicious horse gentled into good behavior by a few pats from a lady's gloved hand on the moist neck and veined muzzle. Sometimes it is well to loosen a strap or start a buckle. We have known the mere act of unchecking and rechecking the animal answer the purpose. It took his attention off in another direction, you see, changed the current of his thought, and broke up his purpose and determination to rest st.

For this same reason an apple, or a bunch of grass from the roadside, or a handful of oats, or a few kernels of corn, will often accomplish what an hour of beating could never effect. The truth is, a man must govern himself before he can hope to govern lower animals. A man flushed with passion, his brain charged with heated blood, and eyes blazing with rage, is not in a condition to think clearly; and it is just this thinking clearly that is, above all else, needed in directing and controlling horses. Hence it is that coutact with horses, and an actual experience in teaching them, is one of the finest disciplines a man can have. He grows to love the colt he is teaching; and no nature is utterly depraved in which is going on the exercise of affection, no matter how humble the object may be. His employment makes it necessary for him to think; and this keeps intellect, which might otherwise have no development alive. The language of the stable is not, as many pious and ignorant people imagine, all slang. Care and anxiety are felt in the groom's room, and consultations held upon the issue of which the health and safety of valuable property depend. Plans are formed and methods of procedure adopted, upon which fame and vast sums of money come and go. Faults of nature and errors of education and practice are corrected, and the trainer discovers that in schooling God's creatures he is being schooled himself. Thus, as in all other branches of honorable industry, the horseman discovers that he is the point from which one current goes forth and another enters in. He bestows, and he receives; he educates, and is educated; and the life which so many thoughtless people despise closes, as in the case of Hiram Woodruff—the upright in heart and act—with honor, and a fame which can fail only when kindness towards animals and integrity among men are regarded as of no account.—*Golden Rule.*

PIEDMONT CLUB, OF VIRGINIA.—The Piedmont Fox-Hunting Club, of which Major Len. Anderson, of Stokes county, N. C., is President, is an organization which embraces among its members gentlemen from Pennsylvania, Ohio, Massachusetts, New Jersey, the District of Columbia, and nearly all the Southern States. The club meets annually, generally in the month of November, and the hunt lasts for two weeks. Not a day passes during that time that they do not succeed in getting a race, and about half of the time in "tailing" the fox. They are mounted on thoroughbred horses, and the club controls for each hunt from forty to fifty trained hounds, selected from packs which number in the aggregate about two hundred thoroughbred beagles. This organization is in fact the most prominent hunting club in the country, if not in the world, and its sporting exploits take precedence, as regards thrilling excitement, unalloyed and health-giving pleasure, and manly exercise, over anything of the kind that has ever been attempted since the days when the noblemen of ancient Germany hunted wild boars in the forests of the Rhine.

TROTTING CENTENNIAL.—The Russian *Gazette de la Bourse* says: "This year will complete a century since Count Alexis Orlov Tchesmensky brought from Arabia the celebrated stallion Smetauka, the ancestor of the Russian blooded trotting horses. The owners of the stable of Khrenovsky purpose celebrating this centenuary by erecting to Count Orlov a monument surmounted by his statue in bronze. The Count will be represeuted driving a horse, after M. Svertchov's well-known picture. On the pedestal will be placed the arms of the Count with a commemorative inscription as follows: 'To Count Tchesmensky, by the proprietors of the Russian breeding stables, on the occasion of the 100th anniversary of the breed of trotting horses, and blood horses called the Orlovs. 1772-1875.'"

SNUFF BOXES.—The snuff box in the days when social formality was more rigid than it is now, bore an important part in the play of wits. An otherwise awkward pause, an occasion for momentarily avoiding the eyes of your interlocutor, or a desire to conceal an uncontrollable expression of your features, could be improved, remedied or guarded by gracefully taking a pinch of snuff as you looked out under the corner of your eyelid at the effect of your sally on the person with whom you were conversing. The snuff box played a great part in diplomacy for a century at least, and within our own day it has been regarded as a very appropriate gift for a statesman or a great soldier.—*Sun.*

ORIGIN OF THE WORD SCHOONER.—In the display of the Gloucester fishermen at the Centennial, in addition to the models of fishing craft of every description, we find the following account of the origin of the word schooner:—

"Cotton Tufts, Esq., being in Gloucester, September 8th, 1790, writes: 'I was informed (and committed the same to writing) that the kind of vessels called schooners derived their name from this circumstance, viz: Mr. Andrew Robinson of that place, having constructed a vessel which he masted and rigged in the same manner as schooners are at this day, on her going off the stocks and passing into the water, a bystander cried out, "Oh! how she scoons!" Robinson instantly replied, "A schooner let her be!" From which time vessels thus masted and rigged have gone by the name of schooners; before which, vessels of this description were not known in Europe or America. This account was confirmed to me by a great number of persons in Gloucester.' The strongest negative evidence corroborates these statements. No marine dictionary, no commercial record, no merchant's inventory, of a date prior to 1713, containing the word *scooner* or *schooner*, has yet been discovered. Since that date no other seaport in the world has had so many schooners belonging to it as Gloucester, which had, in 1875, five hundred and eight."

Appropos of Gloucester, we learn from the *Cape Ann Advertiser* that on Tuesday last, if wind and weather were fair, one Alfred Johnsen, a native of Denmark, aged 30 years, was to have started to cross the Atlantic in a fishing "dory." The boat in which the perilous voyage is to be undertaken is built of pine, being 16 feet in length on the bottom, and 20 feet on top, 5½ feet in width, and 2½ feet in depth; is decked over, with the exception of standing room and hatch-way; has three water-tight compartments, and is provided with a mast ingeniously contrived to hoist or lower at will. She will carry a mainsail, two jibs and a square-sail. The accommodations for sleeping are in the hatchway, where he has fitted up a mattress; there is also a hatchway aft, where he will have an opportunity for rowing, if he should desire.

The craft is nothing more nor less than a common fisherman's dory decked over and provided with a mast and sails. He proposes to take the direct course across, which is followed by ocean steamers, and is provided with chart, compass, quadrant, and other nautical instruments. His provisions consist of canned meats, condensed milk, fruit, hard bread, tea, coffe, etc., and he has a stock sufficient to last him ninety days; also sixty gallons of water. He has an awning from which he expects to catch sufficient water to keep up the supply. He also has a stock of medicines which have been provided for him by Dr. Charles E. Cummings, of Lowell, who has been here on a visit, and taken a great interest in this trip. He is provided with a kerosene stove, on which he can cook, a powerful lantern to hoist at night, to keep vessels from running him down, which is, in our opinion, one of the greatest dangers attending the trip. He also has a drag with which to heave the dory to in case of a storm, and proposes to get the most of his sleep during the daytime, in order that he may be on the watch at night."

Our contemporary says:—

"The general impression is that the project is a foolhardy one, and will not be accomplished; but that he will be picked up by some vessel, after having tried the experiment to his heart's content. This, however, is only one side; there are others who feel confident that he will succeed, and if they only had the pluck and experience in managing a dory that Mr. Johnsen has, would like to try it themselves. There will be an immense desire to hear from him. He has the best month in all the year to make the attempt, and certainly we wish him and his little craft *bon voyage*. We shall have full particulars of the trip in due season. It will be remembered that some years ago the boat 'Red White and Blue,' of nine tons; made the passage across with two men; but that feat is hardly worth mentioning in comparison with the little dory 'Centennial' which is to start on Tuesday afternoon."

BULL-DOG COURAGE.—An evidence of the courage and pugnacity of the English bull-dog was shown in a remarkable manner a few days since, in England. A dog of this description, who had never been accustomed to see trains until lately, has taken a great aversion to them, and has made a point of chasing them whenever he has had an opportunity of doing so, but, of course, without being enable to catch them. On the morning in question, being out with his owner's brother, in the vicinity of the Somerset and Dorset Railways, between the Midford and Wellow station, the early train from Bath was heard to be rapidly approaching. The dog, as usual, was off directly. The gentleman, knowing they were in advance of the train and fearing the dog would be killed, called loudly to him to come back; but quite in vain. He then ran to see what would be the consequence of the brute's folly, and was just in time to see the dog boldly charge the cow-lifter of the engine and disappear. The gentleman then closed his eyes for for one moment, not wishing to see the dog's remains torns to pieces, and on opening them the next moment, much to his surprise, he distinctly saw the dog under the rapidly passing carriages, evidently waiting an opportunity to make a dash between the wheels; but their, to him, unusual velocity rather bothered him; he therefore remained until the last carriage had passed over him, and then emerged, wagging his tail as though he had done something to be talked about, and having only sustained a few cuts about the head, and losing all the hair from one side of his tail.

A HONEY FOUNTAIN.—They have everything on a grand scale in California. There is a hive on the eastern slope of the San Fernando range, in Los Angeles County, which men have tried several times to capture, and have as often failed. It is in a rift which penetrates the rock to a depth of one hundred and sixty feet. The opening is thirty feet long and seventeen feet wide, with two passages. The bees come and go in solid columns about one foot in diameter. Efforts have been made to descend to the store of honey in the rock, but the men were invariably driven back, and one man lost his life. The hive has been known four years, and it is estimated that there cannot be less than eight or ten tons of honey in it. A man who lives in a cabin not far from the spot gets more honey than his family can use from the leakage. It flows out of a small aperture in the the rock like a spring. He has a honey fountain at his door.

The Kennel.

ENGLISH SETTER PUPS.

Lot 1.—Orange and white, six weeks old, by Lark (No. 217 A. K. and S. F.), out of Reddie. Her sire and dam imported from Duke of Hamilton's kennel. Price $20 each.

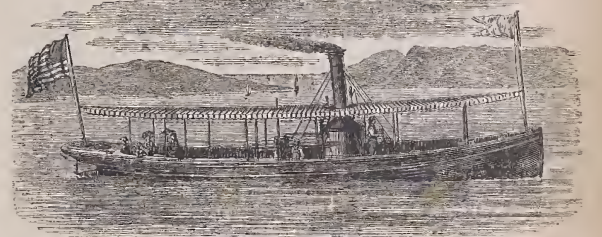
BOW-FACING ROWING GEAR.



A REVOLUTION
IN
BOATING.

This rowing gear is an invention which allows the rower to face forward instead of backward, pulling in the same manner as with the ordinary oars. The oarsman faces the direction in which he goes, and rows faster and more easily than with any other oar. The stroke is longer than with ordinary oars. The oars can be closed up out of the way without detaching them from the gunwale. The boatman makes no more effort in steering than in directing his course while walking. These oars can be attached to and detached from the boat very quickly, and they can be closed up in a convenient form for carrying. Can be attached to any boat, and is especially adapted to hunting, fishing, and all kinds of pleasure boating. Address, during Centennial, "Hunter's Camp" of Forest and Stream, Centennial Branch P. O., Philadelphia.

BUY IT Vanity Fair.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
FEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.

I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.

For Sportsmen.

A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Frir. Best dealers have it.

From A. B. Lamberton, Rochester.

Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.

A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.

We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.

Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

Sportsmen's Routes.

THE "FISHING LINE."
Brook Trout and Grayling Fisheries
OF NORTHERN MICHIGAN, VIA
Grand Rapids and Indiana Railroad.
(Mackinaw, Grand Rapids & Cincinnati Short Line.)

The waters of the **Grand Traverse Region** and the **Michigan North Woods** are unsurpassed, if equalled, in the great abundance and variety of fish contained.

Brook Trout abound in the streams, and the famous **American Grayling** is found only in these waters.

Brook Trout Season opens May 1st.
Grayling Season opens June 1st.

Black Bass, Pike, Pickerel, and Muscalonge are also found in large numbers in the many lakes and lakelets of this territory. The sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st **Round Trip Excursion Tickets** sold to **Points in Grand Traverse Region,** and attractive train facilities offered to tourists and sportsmen; also on and after July 1st **Mackinaw and Lake Superior** Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, send to Forest and Stream office, or address

J. H. PAGE, G. P. & T. A.,

THE SPORTSMEN'S ROUTE.
Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Fond du Lac, Green Bay, Escanaba, to Naganece and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kameska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, over the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEESE, AND BRANT SHOOTING, THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing in localities points on the Northern and Northwestern lines of this company will be found unsurpassed by any to the West.

MARVIN HUGHITT, W. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agt., Chicago.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing missfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like movable anvil made of steel. The nickle cone also prevents missfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2¼ to 3¼ inches.

Shells and Loaders, and description Price List, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,

A. H. BOGARDUS.

may13-1y

EDWINSON C. GREEN'S

BREECH LOADERS,

CHELTENHAM, ENGLAND,

Are unsurpassed for material, workmanship, durability, and shooting qualities. Their superiority in shooting power has been shown wherever tested in this country and in England, standing first, second, and third at the New York trial in 1873; also the highest average at the London *Field* trial in 1875. A case of these guns made to order for sportsmen, and taken from stock, are shown at the Centennial Exhibition, Philadelphia, British Department. Prices, $45 to $250, currency. Those wanting a SUPERIOR gun at a MODERATE cost send for descriptive circular and price list to RUSSEL & HAYDEN,

Jacksonville, Illinois.

HURST'S

Stereoscopic Studies

OF

Natural History

FOR OBJECT TEACHING IN SCHOOLS

And

PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various animals and birds in grotesque attitudes, never, however, violating their natural instincts.

We offer these views, not as pictures only, but as studies from nature. One of the great moving elements in our modern system of education is object teaching. The unerring fidelity of the stereoscope transfers the animals and birds from their natural habitat to the rooms of the student and the fireside of our homes, where they cannot fail to have a lasting impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen, with its appropriate rocks, woods, or water, and coloring from the originals.

CORNELL UNIVERSITY,
ITHACA, March 14th, 1870.

I must congratulate you upon your great success in this new educational enterprise. If we can arrange our amusements so as to make them impart instruction to the mind, it will be a step in advance in education. EZRA CORNELL.

Prices: By the Dozen.....$3 00
By the Set of 5 Dozen, in Elegant Case, 16 00

DESCRIPTIVE GUIDE

TO THE

ADIRONDACKS,

AND HAND BOOK OF TRAVEL

To Saratoga Springs, Schroon Lake, Lakes Luzerne, George, and Champlain, the Ausable Chasm, the Thousand Islands, Massena Springs, and Trenton Falls.

By E. R. WALLACE,

Newly Revised Edition.

Handsome 12mo., Flexible Covers, Red and Gold, Maps, etc. Beautifully Illustrated. Over 300 pages. Price, $2.

TESTIMONIALS.

From Hon. J. T. Headley, the Historian, Author of "Adirondack, or Life in the Woods," &c.

It is admirably written, and has just enough of humor, sentiment, and description of scenery mixed, to make it delightful. The illustrations are well chosen and very effective, while the instructions respecting routes, localities, distances, outfits, &c., embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—a compliment that I trust will be properly appreciated for its extraordinary disinterestedness.

From Albert B. Street, the Poet, and Author of "Woods and Waters," "The Indian Pass," &c.

I think it is the *best* work on the forest that has appeared—superior in word-painting to Murray's, and full of wood pictures and vivid scenes of camp-life. We realize that we are in the forest, are living with you in the scenes described, and that the trees are waving and the waters flowing over and byns. This, I think, the true test of a good book, impressing its reality and distinctive life on the mind. As a "Guide Book," it is most creditable and valuable. Indeed, it is the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for. It must have cost you intense application and labor. You may well be content that you have produced a good book.

From Benson J. Lossing, the Historian.

I have read those portions descriptive of the places which came under my personal observation, with the deepest interest, and most cheerfully testify to the general accuracy of your pictures as I recall impressions made of them at the dates of my visits. I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wonderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.

THE ORVIS REEL.

The Most Compact, Neatest, Cheapest, and Durable Reel in the Market.

NO 1.—This Reel is extra nickel-plated and finely finished. Is perforated to make it light, and keep it free from sand, also that the line may dry without removing it from the reel after use. Has a very perfect click. It is very light, very strong, and holds from 40 to 50 yards of line. It is more compact and less cumbersome than ordinary 30 yard reels. It is quite narrow, and takes up line rapidly. Put up in neat Black Walnut Case, price $5.

NO. 2—For Prizes. Same style as No. 1. Heavy Gold Plate. Extra finish, with case, price $10.

Sent by mail, postage prepaid, on receipt of price, or by express, C. O. D. LIBERAL DISCOUNT TO THE TRADE. Send for New Price List of Fishing Rods, Reels, Flies, Lines, &c., &c. Mention this paper.

THE NEW

BOSTON
SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

W. H. HOLABIRD

Would most respectfully announce to his patrons and friends that he is prepared to make

Shooting and Fishing Suits

at the above prices. The ten dollar suit is better made than any competitor can offer for the same money. My original design having been appropriated by other manufacturers, I have been compelled to make many changes in the arrangement of pockets, &c., for which I have to thank the fraternity at large for suggestions. I believe that I have the

BEST SHOOTING AND FISHING COATS IN THE WORLD,

and respectfully solicit your orders. I send my new illustrated Catalogue, 16 pages, free on application.

Dealers will find it to their advantage to handle my goods. They are better known and more highly esteemed than any other make.

CHAMPION GUNS OF ENGLAND.

PAPE'S

Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun.	Exhibitor.
1st—Greener	Greener.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards, Choke Bores.

1st—Pape	Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape	Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1¼ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

THE GREAT

London Gun Trial,

1875.

W. W. GREENER'S

Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: $75, gold; extra for extreme close shooting, $10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & C. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

Send 25 cents for large Illustrated Catalogue of Guns, and including Game Laws for all the States, and summary of Great London Gun Trial. Ready March 1st. jan13 1y

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH and DURABILITY of the New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.

Selected.

AN ANGLER'S FIRST DAY OUT.

THE wild winds o' winter hae ceased a' their moanin',
The bleak, cheerless season o' winter has passed;
Nae mair the bare bough o' the forest are groanin',
When rent by the force o' the load roarin' blast.
There are buds on the trees, there are flowers by the river,
The lammies are gambollin' on the green lea;
And a' thing is feelin' the freshness that stealin'
On meadows and upland, on flowerst and tree.

The burnie that rushed tae the sea, as in anger,
When the snaws o' the winter came down from the hill,
Is feebtin' and boilin', and splashin' nae langer,
But murmurin' peacefnly, like its sin sel;
And the trooties are lonpin; that must be the reason
Why Tom is sae joyfu'—my crouies nae dear.
We're gaun tae the flshin', and ilk ane is wishin'
Tae catch the first troot, just tao hansel the year.

Ah! as we walk doon through the woodland together,
What mem'ries are crowdin' o' years gane awa,
O' days by the stream, on the lake, and the river,
Or on bonnie Loch Leven, the pride 'o them a';
And we see ourscls doon where the primrose and gowan
Are spanglin' the sward, maog the whin and the broom;
While zephyrs are wreathen' the ripple and breathin'
The fragrance they're gath'rin from bud and from bloom.

"See here's my auld wasp—d'ye mind when I caught him?
Yon braw saumon troot just below the mill-dam;
And here's the same flec that was killin' last autumn,
When naething else would. Are ye listenin', Tam?
When doon by that pool wi' the birk trees ourechangin',
I bookit a big—weel, ye've aye had yer doot.
He flew past the rushes, my line caught the bushes,
'Twas you knot on the gut, tho, that lost me the troot."

"Ye're ready. Ah! weel, I will try a black heckle,
Tosh, see how they're lonpin below the saugh tree;
A drake wing, a hare lug, they'll surely bo fickle,
If they wunna be takin' wi' aoe o' tbn three!"
Now lightly the casts skim the rippling water,
Under banks, under branches, warily thrown;
Till a strike! the line's pukit, a two pounder's hookit,
And the reel's thrillin' music proclaims he is on!"

Let sportsmen delight in the pleasure o' killin'
The wild whirrin paitricks and grouse by the brace,
The packs "deep-mouthed music" wi' joy may be thrillin',
The hearts bold and eager that joined in the chase;
Give me the brief moments o' blissful excitement,
When the strong "insty trout" struggles bravely and hard,
Bounding fleet as the swallow, through deep and through shallow,
Till in fairest proportions he's stretched on the sward.

The main wha thinks naething but what he himself says
Can ever be richt, and a' body's wrang,
The saints, that are saints because nacbody elan is,
Come muse by the river and hear the birds sang;
Come, hearts discontented wi' fortune's reverses,
Come minds dull and wearied wi' meaningless prate,
If fishin' no cures ye o' this it assures ye
That naethiog on earth will alter your state.

For Forest and Stream.

Life in Southern California.

BY this date you will have received, and I hope not quite forgotten, the long letter from Santa Barbara. It was an attempt to let you know how and what we do in California. No place has put this lovely land-locked nook out of our mind. We do not expect to come either again, but should we do the Overland Journey, for the purpose of wintering on the Pacific Slope, *nem. con.* the vote is given for our dear old Arlington, in case we should not be lucky enough to find a cottage. Even then, we should do our dining there. It gives one so many privileges, in its long piazzas, cozy drawing room, reading room, &c. The one great drawback is the tremendous distance between the two oceans.

I took a fourteen mile drive to see Col. H.'s ranch of 3,000 acres, famous for its proprietor, who sold wool enough, last year, to net $110,000. The place I visited has nothing to with sheep. The Colonel has a plantation of sweet (Languedoc) soft shelled almond trees in bearing; what that means you can calculate, when I tell you that he has thirty thousand amaudiers, and that they are, or soon will be, worth a half gold eagle per tree. The nuts we get at Los Angelos were very hard shelled, and not half as large as those produced on Col. H.'s place, very little larger than a filbert. They fetch ten cents per two pounds in market, whilst the Languedoc are worth thirty-five cents. Some old trees of the latter yield thirty dollars worth a year. They are sure for a crop; perhaps owing to their being budded on peach stocks. The other kind is grown as seedlings and fails, two out of five seasons. Col. H. has 10,000 peach, pear, and apricot trees, not to mention orange, lemon, citron, lime, guava, &c.

Dr. W. has a 1,200 acre ranch, on which he has 5,000 young almond trees, some of which are bearing finely. His place is a lovely valley, in which are seventy odd acres of level land, entirely shut in by the coast range of mountains and by high hills, except in the West, where it opens to the ocean, by a beautiful view, stretching across to the island of Santa Cruz, one of the great sheep raising districts, two miles away. Miss W. showed me where a thousand chickens roost every night; their eggs meet with ready sale in the next town. Her sister is a great botanist. In this land of flowers and vegetable wonders, she has ample resources for gratifying her amiable weakness. My journey would be made much more pleasant and profitable had I her knowledge of the names and properties of the vegetable productions I see in such endless profusion.

During my stay in Santa Barbara I read Dana's "Two years before the Mast." It is of greatly increased interest, when perused in the midst of scenes so well and truthfully described. In the edition I chanced to get from the Odd Fellows Library, he describes the marvellous change that had come over San Francisco, between his first and last visits. Of Santa Barbara, he had very little new to remark. Five years have completely transformed it. It is almost completely Americanized, has multiplied its population many fold, is an active business place and boasts, I suspect, the only very good hotel out of Frisco. I saw a piece of land which could have been bought for $5,000 three years ago; $37,000 was refused for it, just before we reached the place. Wealth is pouring in, and with it, people of cultivated mind and good taste, who wish to inhabit this "Loafer's Paradise," where every prospect pleases and man can scarce be vile. I am sure there is not such another *dolce far niente* spot in all Uncle Sam's dominions. If H. had been ordered here, six years ago, to build a depot, he might now have been rolling in luxury, behind a pair of horses of quality, along the beautiful Barbarian beach, which extends a mile to the east of the steamboat wharf. Its bathing advantages, equal to those of Newport or of Narragansett, are just now being enjoyed by the Californians. Of fishing, there is no end, in the channel formed by the island. Our days were so taken up with sight-seeing that we did not angle.

When Monday morning ushered in May day, we went down to an early breakfast, to be in readiness for our ambulance and its two powerful horses, driven by a small Tentonic Santa Barbara man. He is a little, wizened, wrinkled, russet-appled fellow of great intelligence, and an unsurpassable handler of the ribbons. The man who drove us up from Los Angeles was without consideration for peoples back-bones, such fearful bumps and thumps did he subject them to, in crossing gullies or rough ground. Our first station was fourteen miles from the Arlington. To reach it we took four hours, nor was this surprising, when we looked back from the summit of San Marcos Monntains, (one of the coast range) up the 1,800 feet we had just climbed. Henry and Brown—Charley's two steeds—made a superb pull. At some places, we went over solid stone, cut into parallel transverse groves and having an angle of 45°. Usually we walked, partly to enjoy the beautiful landscape, and partly to give our team 300 pounds less weight to pull. It is habitually foggy along the coast, at this season. Monday furnished no exception to the general rule. We missed much of the coast view, but enjoyed that of the beautiful ranches which lay spread so far beneath us.

At the summit "Pat's" stage station is the place at which the tired horses are permitted to rest whilst the traveler partaketh of refreshment. That same was stewed chicken, (and Charley says they always have it). Our fowl must have been that celebrated chicken that crowed in the morn to wake the maiden all forlorn. J. fell back against the breastwork engaged by her attacking knife and fork. She could make no impression on it. S. had an upper joint, but it was "one too many for her." I went lower down and being musically disposed, did essay a drumstick. Nothing but dynamite could have ever made an impression on it. I am sure that by judicious rechauffage, that dish could be made to do duty on Pat's table, for the next year. Many travelers pass the night at P.'s, in order to break the next day,s journey better and to have the morning view from the San Marcos summit. Had we done so, many of M.'s horrors—the flat patterns would have been found in possession of the beds, and the fog would have rendered the view an impossibility.

In descending the north side of the coast range, we found a densely wooded country, containing numberless crystal springs crossing our road, on their way to help form the Santa Ynez River. This flows by the foot of a mountain range bearing the same name. I won't attempt to tell you what superb scenery we beheld, as we looked East and North. Without words spoken to an intelligent ear and a little pictorial help, I could give you no idea of how rarely the grand and the beautiful were united in the panorama spread before our enchanted eyes. Some day I may try to tell you what I feel myself utterly powerless to write. By Monday evening, a little while before the sun disappeared, we reached Ballard's station, forty-five miles from the Arlington. It is a place like Deyton's, described in my last letter to G., at which the mail stage changes horses. It was not inviting, but we were of the begging, not of the choosing class, and made the best of it. The cook and waiter was a Chinaman named Charley, who grinned, laughed, welcomed us, in fine English, and almost offered to shake hands with me. His name and memory are endeared to us by reason of the bread he had made for supper. All four pronounced it the best we had eaten in California and scarcely inferior to the best batches we had even seen turned out in Paris or Vienna.

In coming down the mountain I was invited to ride with a chatty old Californian, who had stopped to lunch with us, at Pat's. He drove an uncommonly fine pair of blacks, to a stout road wagon. His history was interesting and romantic, as that of so many of the old settlers seems to be. Many years ago, he came out to Callao, with coal for use of Pacific Mail Steamship Co. After delivering his cargo, the vessel was found to be so damaged as to require very expensive repairs. No adequate amount could be borrowed on the ship's security, nor was it possible to have the work properly done. He waited until the port charges and other expenses *ate him up*, when he found himself obliged to carry coal, in sacs, for a living. He went to San Francisco and got command of a rickety old steamer, and worked on her until he cleared enough money to go into the distillation and rectifying of petroleum. Succeeding very fairly in this, he was burnt out one night, escaping only with a linen coat and plenty of pluck. In one way or another he drifted down the coast, where he bought (I think he married) a widow, with a 50,000 acre ranch. In the course of time he has grown very well off, by means of sheep, cattle, and grain. At the present he is considered a very rich man. His father was a captain in the English Navy, and he would have also entered the same service, had it not been for deafness of an incurable kind. I found him unusually intelligent and agreeable in conversation. Like most of the ranchers, he was never weary in extolling the unapproachably superiority of California, to all other countries. Now, Captain, there must be some drawback to your life. It is too good to be wholly true as you describe it, said I. "Wait a bit, I'll tell you something. In 1864 there commenced a drought which lasted twelve months and twenty-seven days. In all this time, not one drop of water fell on the earth, where I lived. I lost over 3,000 sheep, and nearly all my cattle,

by starvation. The sheep I had driven off in search of pasturage, only about 300 ever returning, from a distance of a hundred and forty miles to the south. My cattle I kept from perishing by having hundreds of oak trees cut down, from the evergreen leaves of which they managed to get subsistence, until the rains came. Then, as if by magic, green juicy grass seemed to spring up from apparently barren earth, which had been baked hard by more than a year's constant heat of the sun. I've never had a bad year since."

Another drawback I found to consist in the number of weary miles over which their produce must be taken to the nearest shipping point. To the farmer, his grain ceases to be valuable, when heavy transportation must be added to the expense incident to growing and harvesting it. So, too, with wool and with sheep. By reason of a change in our tariff laws, wool growing is now conducted at a merely nominal profit. I have known good sheep sold for one dollar a head. Many sheep farmers will gladly dispose of their flocks, for a dollar and a half. Two weeks ago, a man in St. Louis, Obispo county, sold his for fifty cents a piece. To such people as these, the hitherto golden fleece is not eighteen carat fine.

During the latter part of our first day we passed through miles and miles of the Oak Park country I described in my previous letter. Even after many leagues of it, I could not persuade myself, now and then, that we were not about to see some handsome dwelling that would be in keeping with the noble oaks and flowery lawns. None such appeared. When we did see a human habitation, it was, as often as not, that of a shepherd, who was out with his band of woolly one's, and in leaving his hut, had left it tenantless, so to remain, until he had brought back his charge to the corral, at night fall. The end of the second day found us at a small town called Guadalupe. It takes its name from a celebrated Rancho of that name, bought some years ago for $150,000. The present owner has already sold off property to realize the above amount and has done very little to diminish his acreage. Just before reaching G. we passed through 40,000 acres of beautiful barley, 10,000 acres of wheat, and a good many thousand acres of Irish potato land. All these fields were without intervening fences; moreover, the barley, in many of them, had not been planted for one and two years. It was what is called "volunteer," or grain that grows from the previous year's seed that had fallen upon the ground and been simply raked in, by having a heavy harrow driven over the field. That constitutes, absolutely, all the cultivation it receives. Near G. is a famous region for butter and cheese making. It is only four miles from the ocean and is never without a peculiar and abundant supply of grass. Many Swiss live hereabout and are considered the best people to manage the dairies. Honey is another product of the place. This year the yield is bountiful, floral supply being unusually great. In dry years the "little busy" makes nothing for his master. Fifteen miles before reaching Guadalupe, we left the hills and came down to the Santa Maria Valley. I pointed out the mist brought up from the Pacific by the Northwest wind. How we wished I had proved to be a true pointer! When we got into the haze, it turned out that the mist was of sand, whirled by the keen cold wind right in our faces, so as to sting the skin very sharply and to render it impossible to keep our eyes open. I need never to cross the Great African desert, to know what a "sand storm" means. I well remember how I used to pity the poor caravans, as pictured in my old "Jografly," with the camels kneeling down and their riders trying to seek safety by getting to their leeward and crouching on the sand. We were told that such an experiment as we enjoyed (?) was a sure thing for any one passing over those fifteen miles, after 11 A. M., from now until the rainy season. October is an early month for that desirable change of weather. As we mnffled ourselves up and I breathed through my overspread handkerchief or respirator, Charley said, "Oh! dese sand storms is very bad, somedimes. I was vunst herdin sheep for Mr. T. down by Ventura. Dey cum a sand storm an' lasted three days, ven it was oher I hat lost tree hundert sheep. Dey was perried up by de sant. De nex man to me, he had lost 'leven huudert."

The end of our second day's drive found us dirty as pigs and very much sunburnt and used up. Mr. J., landlord of the Revere House, matches his hotel for style and neatness. As is almost always the case, we sat down to the universal *fry*. No easy task did it prove to find out the worst thing set before us. According to custom, we decided to put our trust in eggs, as being the only food we could tackle with confidence as to cleauess and possible edibility. Wednesday's journey was toward San Luis Obispo, a place of note, in county of the same name. It contains about 1,500 people, and is an important business centre, in a country producing much grain and many cattle and horses. It is only eight miles from a sea-port of the same name. We stopped there to land and take on passengers, twenty-one hours from San Francisco on our way down the coast. Great stories had been told us of the great and comfortable satisfaction we should find at the C. Hotel. We met with disappointment in every thing, and were glad enough, when seven A. M., and Charley came on the following day. Out of town, up a long steep mountain of the coast range, we plodded our weary way. The disagreeable Northwest wind kept us company for seven or eight miles, but ceased to trouble us, after we turned eastward and left the mountain chain behind us. On our way we passed the "Rancho Santa Margnerita," an affair of 7,000 acres, used as a cattle range and belonging to Mr. P. M., a native of California. As we came through his broad acres, the annual "Rodero" was going on. We drove over to a stand, somewhat like that in which the judges were seen, on a race course. Here was the ranchero, looking on superintendingly, whilst his vacquoros were marking and branding the calves, constituting the increase of his herds, since last year. The vaequeros were mounted on finely broken mustangs, and used their riatas with a dexterity that left nothing between it and the marvelous. Two horsemen caught the animal to be insignified; one putting the lasso over the head, the other catches the calf by a hindfoot. The horses were made to put the cords on the strech, in opposite direction, when the victim soon tumbled over on the ground. So dexterous are the operators that a dozen of them can do all that's necessary in the premises in an hour, for a hundred incipient beeves and cows. In old times, what we were beholding was a great occasion. The rancheros family and friends were assembled on the stand, a band of music played and refreshments were served. When any Vacquero performed an unusually brilliant feat, the master would scatter handfuls of silver coin amongst those engaged in the carnival. After all the young critters wants had been attended to, Mr. M. was kind enough to let his quarter hundred mounted men make the rodero (Rodero) itself. This means a general gathering of cattle which feed in a particular neighborhood. Before going up to the hills and valley, wherein his herds were at pasture, the vacqueros wished to change some of their horses, for fresh ones. About fifty were driven into a corral, into which entered the men on foot. Each selected his steed he wished to hestride, and with one cast of the lariat had a halter on the animal's neck. The mount having been completed, away the cavaleade went, in every direction from which the herds were to be driven. From previous experience the old cows and beeves repaired, at once to the "stand," as Mr. M. called the place of assembly. In an hour or so, the last comers had joined those first to arrive. Probably there were gathered something like six hundred, all huddled together and kept in a compact body, by the living outer circle of horsemen. The work of "parting" now commenced. The cows and calves not previously marked were driven out of the great mass and put into a field by themselves. These remaining were allowed to go on with their quest for food. Now and then, an unruly member would break away and scamper off toward the hills and wooded places. Then one or two vacquoros would pursue and try to make him join the mass. If obstinate in refusing to do so, the riata would be thrown with unerring aim, encircle its head or heel, the cord would tighten, the mustang and rider brace themselves *per contra*. when over would thumble the pursued, a helpless heap of dust, hair, and bellow. Now and then, the rider dashes up by a running bullock, grasps its tail and with a dexterous jerk, both running at full speed, capsizes his prey. Mr. M. told me in reply to a question, "I don't know how many eattle we have. I am pretty sure of 12,000, but it may be n thousand or so out of the way. We have them grazing from here to eighty miles eastward of this ranch." He told me he had frequently lassoed grizzly bears. I'd give a hundred dollars to see *that* performance. M. has unbounded respect for his cowherds. He is a better vacquero than any of them, as was shown at a State contest, from which he emerged champion. At full speed he can lean from his saddle and pick up a whip, on the ground, or a half dollar from a peg three inches high; with the riata, they say he is wonderful.

After thanking our courteous master of the rancho, we drove on through the oak parks, until we reached "El Paso de Robles," a famous watering place, at which warm sulphur springs and baths of mud are found. Some years ago two shepherds bought many thousand acres for sheep pasture; it cost them twenty-five cents an acre. The sulphur water was used to dip and wash their flock for ere of scab. In time they came to hear how the natives and early Spanish settlers had found the spring water to cure rheumatism and other ailments. Then, they magnified the virtues and poteney thereof, got a sounding physician's certificate of endorsement, built a sort of tavern, (a la White Sulphur Springs) surrounded with cottages. For the spring alone they have refused $150,000.

After leaving P. R. we had an uneventful but very pleasant drive to Solidad, terminus of the Southern Pacific Railroad, our joy was not small to reach the end of the slow and dusty progress we had made, moreover to get to S. we had been obliged to leave our not very comfortable beds at Low's Station, between two and three A. M.

We have seen thousands of squirrels, hundreds of partridges, a few ground owls and one wild cat, not to speak of great and small hares. Now and then, ducks in pairs, and flocks of sand hill cranes would present themselves to view. Many magpies, California jays, birds with exquisitely beautiful shades of blue in their plumage, brilliantly feathered woodpeckers and a lovely little sparrow, inhabiting those great parks, constituted our aviary in addition to the gnmo birds already mentioned. From Los Angelos to Solidad, 334 miles, the traveler's experience becomes somewhat unpleasantly monotonous, with the exception of what is met with, in and about Santa Barbara, and what I have tried to describe as unusually attractive episodes. Those enormous ranches prevent people of small means from becoming landholders. Nor do the rancheros themselves indulge in cultivation of any thing asthetic. Their houses are such as one sees in the backwoods of our Western States—mere tenements for protection against the elements. We all, simultaneously, called each other's attention to one road-side dwelling, the enclosed front yard of which had been laid out as though a landscape gardner had had a voice in its arrangement, whilst on a rough Etagère, on the gallery rested a dozen flower pots. In those 334 miles we saw not another such by-the-way sight.

From Solidad, on Sunday morning, we gladly enough took the 9:35 train for San Jose, distant about eighty miles. Of this lovely place, I shall have somewhat to say in my next letter.

I am now writing from the Palace Hotel, on the morning of Wednesday, the opening day of your great Centennial show. We reached here yesterday. J. T. M.

For Forest and Stream.

BAY BIRD SHOOTING IN MAY.

"DON'T move a hair! Here they come to the left. Jerusalem, what a bunch! Down (whispering) down! Whistle, Jake (to our gunner). Remember now, both at once!" And as the flock of graceful birds swing over the stools, bang, bang, go the four barrels, sounding like two, and the survivors dart in different directions over the meadow.

"Little too soon that time. How many, Jake? There's one to your right, a little this way. So, did you get any the second time, M. ?"

"Thirteen," says Jake, tossing the birds into an oyster basket. "Mostly calicos, but some grayback and robin-breast. It was a good bunch, but scattered all apart. See yonder, that bullhead; he's coming this way (whistling softly as the bird sights the stools, louder as he mounts upward and hesitates, and then, as if satisfied by the imitation, sets his wings for the stools, and swooping downward leaves his life in the air to S.'s right barrel.)

"Strange these plover won't decoy on the bars, and yet will come in so on the meadows," remarks Jake. "I believe that bird come back from the bunch that just went away." Throwing him into the basket—"that makes six bullheads so far."

"See those curlew," exclaimed S., pointing upward; "a hundred at least! No use calling I suppose (resignedly); but don't I wish we could get into them. What a pretty note they have," as the tremulous call of these birds came floating downward. "We must come down next August for these curlew and willets. They decoy right well then, and are fatter than now. I've seen some of these robin snipe split open when killed then, they were so fat and tender; but the mosquitoes they were had then.

"Yonder's a nice lot of graybacks," broke in Jake. "See, this way, tother side of the thoroughfare; down they go again. Here! quick! kill this calico—whistling coolngly to a single bird that had come up unperceived, and was circling away.

"Take him, M.," and down he comes with a broken wing by an unkward hurried shot from the writer.

"Its the beginning of ebb," says Jake, after a pause and rising. "We must get fixed on the bar by then; the birds seem to be hungry, and we can reckon on some shooting this afternoon at low water. I'll bring the dinner from the boat, and we can eat it here." So the basket and jug of water are brought, and the long-lost appetite that was left in the woods last summer comes back and is heartily welcomed.

We are in "Ludden's Sound," Townsend's Inlet, N. J. Coming down from Philadelphia, summoned by the glad tidings "bay birds are here," my friend S. and myself are off for a couple of days' shooting. This kind of sport has often been described, and is almost universally enjoyed by gunners. There are exceptions, however, who affect to despise it, but then they are always pitied for lack of judgment. Banwell deligbted in Barnegat for his bay bird shooting as much as in Superior for his fishing. Brigantine Beach is a good place, but used a great deal. Beesley's Point, not quite as famous, yet affording good shooting; but lower down the Jersey coast than any of these, just above Cape May, where the marshes fairly begin and the birds first strike the meadows, is Capt. Bill Sutton's modest gunner's retreat, where one is always welcome, a retired sailor, who, by his honest, straightforward manner, has made hosts of friends among that class of undemonstrative men who like sport for its sake alone, and will always take their ease in their own inn, yet in a manner different from old Sir John's. Sutton is a Jerseyman of pure blood, honestly believes that he can kill forty-nine pigeons out of fifty at twenty-one yards, is down on all the Yankee emigrants into his beloved State, can sail a boat closer into the wind's eye than most of his class, and having made the subject his particular hobby, can, as a result, kill ducks with any "Spaniard of them all." His house is back from the waters of the Sound about three-quarters of a mile, commanding a good view of the same, together with the sand hills of the distant beach, and near enough to the ocean to have the sullen morning of the breakers ever present to the ear.

Leave Philadelphia at three P. M. and you can partake of his fish, sweet potatoes, and oysters at seven. Tuesday A. M. at five, S. and the writer, with our guns and shells, together with Jake Sutton (Captain's brother) carrying the lunch, decoys, etc., started for our day's shooting. The weather looked black and threatening, every sign that the northeastern storm would hold on. After traveling from place to place, looking for birds, we made our blind on the meadow, where we determined to stay until the "bars" closed at low water, when we would transfer our position to them, as from the fact that comparatively few birds were moving about on the meadows in the morning, the chances of having good shooting when they came to feed at low water were greatly increased.

At noon we had two birds—grayback, or as some call them "Jackson" snipe, correct name being "dowitcher." Our poor luck was disheartening, but about one o'clock it changed completely, and for some cause—we could not explain it—the birds came fast and furious—single birds, bunches of six or eight, and occasionally flocks of fifty and upwards of various kinds were all around us. First would come a single calico back, then three or four graybacks, followed by a flock of ten or twelve birds, led generally by a big "black breast" or bullhead plover, and containing among them, especially in the larger bunches, graybacks, robin, snipe, plover, calicos, little black breasts, with now and then a yellow leg. Some would pass us by resolutely, we three "charmers" charming never so wisely; others would circle around answering our call, but shy of the blind, while the single birds at once generally set their wings for the stools. There was great sport that afternoon; no tramping over sticks and stones under a hot sun, and if there was a little rain and coolish wind there were no mosquitoes, and we sat in comparative comfort and took our shots as they came.

Scattered over these meadows in every direction are small irregular pouds half an acre or so in extent; these in winter are the regular roosting places at night for ducks, and in summer the best spots for bay birds next to the bars at low water. From our blind that afternoon at one of these pouds, looking towards the ocean the sails of vessels far at sea could be seen like white gulls against the dark horizon's line. Last night they were buffeted hither and yon by the fierce northeastern storm, but now move stately by with scarcely a perceptible motion, although by the roar of the surf they must still be plunging through the waves. The beach in this vicinity is strewn with the bones of vessels that have been too venturous, the last victim being a schooner wrecked a week ago. As she was old, and trade at present in her line very dull, the Jersey mind is pregnant with misgiving and suspicion, and no doubt at the "veudoo" just held where her remains were "hammered" away the subject of insurance was fully discussed.

It is very pleasant to camp among the hills of New York or Pennsylvania, or paddle over the lakes of wild Canada and take the trout and deer in plenty, the lights and shadows on the lakes and mountains, the song of the bird and murmur of the forest make such recreation thoroughly enjoyable and ever to be remembered with delight. I remember of telling my guide last July, away up in the forests of Muskoka, about this bay bird shooting, where the water rose and fell twice in the twenty-four hours full five and six feet; where the bottom of the bays was covered with multitudes of fine oysters, to be had for the picking up at low water; how we had caught weak and bluefish by the boat load in a morning's fishing during their season, together with sundry other marvelous (to him) accounts of crabs, eels, etc., all of which was within seventy miles of my home, and of laughing heartily at his profane expression of utter disbelief in the statement When we are enjoying the mountains we think of the shore and *vice versa*, both are worth living for in their way.

After our lunch, and while waiting for the tide to fall, Jake's back was brought into requisition to keep off the wind, and leaning against him cigars were produced to aid

us in our watch for birds(!) S. never smokes, and thereby has nothing to console him when the flights are slow—at least nothing apparent, but he certainly makes up for the loss when they do come, distracting his thoughts by the destruction of birds. One good thing about this bay bird shooting is that the more gunners there are on the marshes the better the sport is apt to be, as the birds are thus kept moving all the time; there are also, as a consequence, more faces at the table at the house, and a corresponding amount of "chinning" about guns, etc., in the wide "reception-room" when supper is over. Robinson Crusoe, nervous chap that he was, received no severer shock at the sight of the footprint on the shores than the writer has felt at beholding, in the sand of the trout brook, the print of "some feller's" shoe that had just got in ahead; so while trout fishing is to be enjoyed best by not more than two at once on the same stream, bay bird shooting affords ample room for scores of gunners on the same meadow—but I forget, those vessels.

From our boat resting on the bar that afternoon, while the tide was coming down, we could see, as in the morning, the white sheen of the sails of numerous ships and coasters, large and small; there were traders from neighboring ports running close inshore, and the fruit and oyster boats of the coast below, while further out, dimly showing their upper rigging, were the greater ships bound for a distant sea, steering out over the surface of the ocean that was looking that day as forbidding and wild and savage as when of old the timid navigators of Italy and the North crept along within sight of their coasts for fear of the fabled "sirens" of the deep. It was frowning and roaring, when we looked across the sand hills, as when later in history sailors were growing bolder, and steering by the stars out of sight of land, were talking with wonder of him of Genoa, the master spirit of that age, who had just shown the way across the sea. Lying in the boat watching the sails was lazy work, but there were no birds flying as yet, so we could do nothing but wait for the tide to fall.

"I have ships that went to sea more than fifty years ago,
None have yet come back to me, but keep sailing to and fro;
I have seen them in my sleep, plunging through the shoreless deep,
With tattered sails and battered hulls,
While around them screamed the gulls,
Flying low, flying low!

* * * * *

"I have waited on the piers, gazing for them down the bars,
Days and nights for many years, till I turned heartsick away;
But the pilots when they land, come and take me by the hand,
Saying, 'You will live to see
Your proud vessels come from sea,
One and all, one and all!'"

* * * * *

That poem is a metaphor that goes straight to the hearts of its readers; it is a song as old as language, and the passion expressed as common to us all as the hunger and thirst of physical life. We send out our ambitions and hopes and desires very early, some as far back as school time, and they leave us every year; some that should take but little time for the journey, and others that if returned at all, may come when their arrival will bring no joy for us. The complaint of a lifetime is in those six verses, and the fulfillment of the desires of the heart can be spoken with truth, as of ships at sea. The sailors of the port who have, likewise, their ventures on the same sea, if they be friends will comfort us in time of wreck all they can, for they have passed through the same storms; the waiting and watching during the long nights; *this* vessel that brought back no return for the long voyage, and *that* one in particular, with its rich promise, that was utterly wrecked just in sight of port. Some of us have known it all, and the occasional wanderer that returns only makes the delay less dreary for a moment, and then we return to hoping and watching for one more that perchance was wrecked while we slept but an hour. How they have wandered since they sailed away! Although we have dreamt of some of them many times, present with us asleep as well as awake, they are absent still the same.

The gulls hovered over us continually during the morning on the meadows, and offered good practice at their elevation. Very soon little patches of mud began to show above the water, and the birds commenced to stir about; little flocks of beach birds were the spies sent out to see if the tide was down, and then the shooting began. At one time S. and myself were out of shells, our boxes being in the boat that Jake was using to gather the floating birds, while we stood in the mud on the bar, little concealment being necessary, as the birds were very tame.

We killed that day 108 birds, embracing robin snipes, graybacks, bullhead plovers, and black-breasted snipe—that is, we gathered that number, besides losing about twenty that fell in the grass and water. Wednesday, shooting only five hours, we got 38, and Thursday afternoon I came up to the city. S. killed 64 alone. Next August will be the time, and I hope that month will find me there.

MUSIC.

For Forest and Stream.

JACKING IN THE NORTH WOODS.

AS I sat at my desk this afternoon, worn out from the effects of a very busy day, my thoughts were irresistably turned toward the old North Woods in general, and to one memorable night in particular. Half closing my eyes I could see the little bark shanty on the side of the lake, the sun gradually sinking in the west, the pork frying in the pan, and the trout all ready on a clean chip awaiting their introduction to the hot lard and afterwards to my expectant palate. The boat, drawn half way up the beach, was having the jack pole fitted to the hole in the bow, and the last touches of the experienced hand of old John were given to the two candles, so that there should be no mistake when the signal of light-up was given, when we should hear the "swash-swashing" of the old fellow whose tracks we saw in the inlet while we were catching our supper. The sun has gone and the trout are safely stowed away under our jackets; we fill our pipes and wait until it is sufficiently dark to warrant our starting out. It is nine o'clock, the moon has gone, and the slight breeze which had for a time kept the leaves of the tall poplar that stood among the cedars on the margin of the lake quivering and rattling died away, and nothing save an occasional hoi hoi ho——al of an owl or the croaking of a frog broke the stillness of the night. I knock the ashes from my pipe, and putting two fresh cartridges in my gun, I call John. Groping our way to the boat, we get in and silently paddle across the lake to the marsh on the other side. Stopping to to listen my heart gives a jump as the muskrats, frightened by the sight of the boat, dive below the surface and make such a splashing that I surely think it must be a deer, but a minute's consideration convinces me that it is a false alarm, and waiting long enough to be satisfied that I am mistaken, I whisper to John to try the head of the lake. Backing out from the shore he turns the bow toward the inlet, while I, making myself as comfortable as my cramped up legs and now aching back will allow, take lessons in astronomy from the reflections of the stars in the water. For fifteen or twenty minutes nothing is heard but the stealthy dip of the paddle as we work our way toward the head; on rounding a point the momentum of the boat is stopped, as we are now nearing one of the favorite feeding grounds for deer. A suppressed hist from John tells me he hears our game; waiting long enough to satisfy myself that I am not mistaken this time, I strike a match and gently raise the blazing splinter toward the jack, fearing every instant that it will go out, or that the deer, startled by the sound of the scratching, may take alarm and whistle us his good-bye as he bounds away to a safe retreat up the side of the mountain. The candles flicker and snap as the heat touches their damp wicks, but finally burn up bright and clear. I slowly turn the jack shoreward, and, through the fog which has commenced to form on the surface the water, I can see the ghostly form of a deer, his eyes shining like two balls of fire, his head up, and ears thrown back gauging at the lights that were, to him, sailing over the water. Bringing my gun to bear so as to cover his shoulder, I pull the trigger. The loud report dies away in a hundred echoes, and then all is still. When the smoke has drifted away we land the boat, take out the jack, and search for our game. In a few minutes we come upon him where he fell. It takes but a minute to bleed and drag him down to the boat. Blowing out the lights, we put out the oars and return to camp. His heart broiled over the embers, together with a cup of hot tea, takes the chill from our bones, and wrapping our blankets around us we lie down on our hemlock couch well satisfied with our night's adventure. TAHAWUS.

New York, May 22d.

For Forest and Stream.

THE BEAVER RIVER.

FOR pure air and water, beauty of scenery, fair speckled trout fishing, neat and cleanly quarters, good boating and good board at low prices, I know of no better place for a family to spend one or two of the summer months than at C. A. Fenton's, No. 4, Watson, Lewis county, N. Y. Owing to Fenton's great popularity with his guests, he has found it necessary this year to increase his accommodations by the addition of another house.

Six years ago, while wandering with my guide, the noted John Sabattis (now dead), in search of new ground, where we might enjoy wilder scenes and have better angling than we had been in the habit of having, we stumbled upon Fenton's. So impressed was I with the beauties surrounding the place, and so pleased with its near proximity to the railroad—the distance to Lowville, on the Black River Railroad, being only fourteen miles of good and four miles of bad road—that I entertained strong hopes of inducing my family to accompany me on my future trips to the wilderness. For several years previous they had refused to go in consequence of the hardship (to them) of making the journey in and out of the woods. After much urging a bargain was made that we were to go, and I was to bring them home in ten days if they said so; but they said no, but willingly stayed six weeks, and have gone every season since but one, when I went alone to explore, and we have engaged accommodations for this summer also.

There are any number of streams, ponds, and lakes in the neighborhood, where speckled trout can be caught by starting from the house in the morning and returning the same night, but if one prefers to stay longer new trips can be enjoyed without number. A short day's trip down the Beaver River will take one over a succession of rapids and falls to the noted Eagle Falls—a delightful trip, which can hardly be excelled—while up the river for fifteen miles there are seventeen rapids and falls, and fine fishing.

I would advise any visitor to Fenton's to make this trip, if he go nowhere else. I have walked up and down both banks, and some years since went down in a boat, making a trip of three days from Fenton's. My guide, Boyd, Sylvester Edwards, and myself walked by wagon road up the river eleven miles to Stillwater (Mr. Wardwell's), took dinner at his house, which is the last human habitation in this direction for sixty-two miles by "carries" and water courses, took our boat, blankets, some few camp utensils and provisions, and moved down the river. By dusk we had gone over the "carry" and down four rapids, and had a fine lot of speckled trout, all killed on the fly. Not wishing to be encumbered with anything that we could get along without, we brought no tent, and having fished too late to peel bark and construct a shanty by dark, we resorted to the very common device in the wilderness of sleeping under our boat. Turning the boat bottom up, one end was placed on slightly elevated ground, and the other raised by a stick about seven feet; two crotched sticks were cut and pushed into the ground about three feet from the boat, and a side pole laid on top parallel with the keel, then a rubber blanket was laid from the keel to the ridge pole, making a shelter from dew about six feet wide. As an additional protection against wind and rain, large branches and saplings of spruce and balsam fir were cut and planted against the side of our house. Cutting enough balsam boughs for our bed, and wood to keep us warm during the night, after partaking of a delicious supper of trout, fried potatoes, wheat cakes, with maple sugar and butter, and tea, was to lie down and dream sweetly of the morrow.

The second day we made but about three miles, as the river was generally shallow, and filled with huge rocks.

In order to get over this part without damage to our boat, the guide waded in the river, holding fast to the stern, while I in the bow covered every spot of water with my flies where a trout was supposed to lurk. We met with good success again, and landed for the night at the outlet of Mosher's ponds, where we again rested under our boat.

The third day's fishing was not so good, as it never is in this part of the river. The rapid became more precipitous and heavier in consequence of being contracted in less space, and for some two miles we had to carry boat and baggage. Home was reached at ten P. M. We were not over tired or hungry, but were very happy. I might write for a week, giving you detail of pleasurable trips in this section, but cannot spare time to say more at present.

W. W. HILL.

Fish Culture.

FISH CULTURE IN NOVA SCOTIA.—The Fish Commissioners of Canada are making vigorous efforts to restock the rivers of Nova Scotia, and the new Hatch House at Bedford, near Halifax, under charge of Mr. A. B. Wilmot, has produced over 400,000 salmon ova this season, which have been distributed among various rivers in the Province, 25,000 and more to River Philip, Cumberland county, from whence the ova were originally procured, and some to Gold River, and some to Sackville River, which is now preserved against all fishing. We would suggest that some be sent to the Indian and Ingram Rivers, St. Margaret's Bay, once the favorite resort of salmon, but now somewhat depleted by over fishing and obstructions from dams and saw-dust. The Nova Scotia rivers, as soon as rehabilitated will take precedence of those that empty into the Gulf of St. Lawrence, as they are not only already more accessible, but will be made more so by the new railway to run across the peninsula from Annapolis, on the Bay of Fundy, to Lunenbury, on the Atlantic, which is now being constructed.

FISH AS A FARM CROP.

SETH GREEN likens the raising and killing of fish to the raising and killing of chickens, or any other domestic animal, and urges fishermen to spare the little ones. The idea is a novel one, but most sensible. There is no more sense in taking fingerlings for the table than there is in making pot-pies of chicks a few weeks old. We copy Mr. Green's letter from the Rochester papers:—

"ROCHESTER, May 30th, 1876.

"Nearly every farmer raises chickens, and in the fall he counts them and makes up his mind how many he can kill. If he is a good manager he will have a chicken dinner when he feels like it the year round, and will have some left to raise him another stock the next year. But if he kills them all as soon as they are large enough, he will go without chickens the balance of the year."

"The same is the case with regard to fish. Although you cannot see the fish to count them as you do your chickens, yet the fact remains that there are a certain number of fish in each locality, and when that family of fish is caught in its respective locality they are all gone. You can no more expect to have fish dinners from those waters thereafter, than you would chicken dinners after your chickens were all killed. Now let me tell you how to manage, and you will have a fish dinner whenever you please. Never take any more than you want for your present use, and perhaps, if they bite well, take a mess for your friend, and then stop fishing when you have got enough. If you catch a small one, take him carefully off from your hook and put him back in the water; don't throw him down in your boat and take him ashore for the purpose of counting him, and then throw him away. That little fish, if put back, would grow to be a large one in time; and the man, woman, or child, that does not put that little fish back, is worse than a brute; for the brute, with few exceptions, will not kill anything for fun. I want the readers of this letter to ask themselves whether they ever left in a boat any little fish that were too small to cook? If you have, never do it again. Show your manhood, too, by informing other parties that you may see doing it that in the gratification of their pride they are wantonly destroying the lives of little fish. Say to them (If you do not feel too indignant to pucker your mouth to say it), "Please do not do it again." Do not expostulate with them harshly, for kinds words will be more likely to be remembered."

"If parties living near the lakes that were stocked with salmon trout in the years 1872 and 1873, will anchor a buoy in the deep water and bait with small fish twice a week they can go to that buoy and drop a hook baited with a piece of the same kind of fish that you have been in the habit of scattering around it, and take a mess of fish whenever you please. This fish will last the season through, provided you manage taking the fish with the same judgment that you do your stock of chickens, and stop killing when you have got a mess."

"Fish are local, and there is a certain number of fish that live in the neighborhood of your farm, and they do not go further from it than your chickens do from your barn; and there is a rule among fishermen that is generally observed: If a man sets a buoy and keeps it baited it belongs to him, and no well-meaning man will fish near his neighbor's buoy. "SETH GREEN."

CONNECTICUT RIVER SALMON—THE EFFORTS TO PROPAGATE THEM SUCCESSFUL.

HIGGANUM, Ct., June 19th, 1876.

EDITOR FOREST AND STREAM:—

The gentleman I spoke about in my former letter—the one who thought "stocking the river with salmon a humbug"—wrote a few lines to that effect and inserted them in the Hartford *Post*. The inclosed, taken from the *Post*, is in answer to him, and a good one I think, and equally as good to the rest of the *few* old fogies we have among us:

"INFORMATION ASKED AND GIVEN.—An apology is due to the Higganum reporter, who, on Monday last propounded a series of question in regard to salmon. The absence from the city of Robert G. Pike, Esq., Fish Commissioner, from whom the information was obtained, must be our apology for this seeming neglect. Mr. Pike having returned Friday, we have obtained the desired information, and proceed to remark that it is the privilege of children and simpletons to ask foolish questions, such as the Higganum correspondent unconsciously airs his ignorance. He is probably belongs to that formerly numerous class 'down it, river' who ridiculed the idea of increasing shad in our rivers, who poked fun at the Commissioners for trying to improve on (to quote their refined language) 'to improve on the Almighty's works.' Now that a grand success has crowned the efforts of the Commissioners, and shad have multiplied beyond our waters beyond the most sanguine anticipations, some people have all they want at reasonable prices, instead of being wounded or mistake is

carping geniuses are silenced in regard to shad, and in their chagrin turn their pop guns against the salmon. But it will be all in vain. The Commissioners are men of character and ability, and know what they are about; they have thoroughly investigated the subject and are quite as likely to be right about it as our Higganum critic. We do not know how we can state more definitely the fact that salmon were caught down the river than we have done. We have read the letter of Commissioner Bill, of Lyme, to the effect that, during the week ending 28th May, quite a number were caught by the gill net fishermen at Lyme, that they were seen and examined by him, that he preserved and showed them to numerous persons, and they were finny salmon, and were admitted to be such. They were from six to nine inches long, and were entangled in the fine twine of the net and brought in in its fold. Such fish had never been caught before, and the fishermen did not know at first what they were. If Hagganum wants more information, Commissioner Bill will give it, with the names of the fishermen, and if he has not parted with the "sample salmon" will, doubtless, show it to him. But we will not undertake to "convince" those people unless we have some better assurance that they have brains to comprehend.

"The Higgaoum correspondent shows his utter ignorance of what he is talking about when he asks the question: "Do salmon have teeth on their tongues?" He evidently did not know that salmon do have teeth on their tongues—a fact koown to everybody who ever examined a salmon. If he don't believe it, let him thrust his finger into the first salmon's mouth he sees, and he will have a realizing sense of teeth before he gets it out again. If this correspondent had read the last report of the Fish Commissioners he would know a great deal more about these fish than he now knows. The first great planting of salmon fry in the Connecticut River by the Commissioners was in 1874; about two years elapse before their scales appear, and then they go to the salt water. They are then known as "smouts." And these were the fish caught and given to Commissioner Bill. Those that escaped the gill nets and reached salt water will return next year, or perhaps a part of them the year after; the time of absence in salt water differs in different rivers, and the Commissioners have yet to discover their habit in the Connecticut. In answer to Higganum's final question we have made inquiry, and learn that $3,000 will be needed this year for the work, and that the Fish Committee of the Legislature have reported and recommended that sum, and it will doubtless be voted without any great show of oppositioo. The people of this State are too well pleased with the success of the Fish Commissioners thus far to deny any sum they may ask. So the 'good work' will not lag for want of liberal appropriation; and the car of progress will sweep along on its track, in spite of all the carping and growling of our Higgannm Tricod and his friends down the river."

I hope we shall hear more from both sides, for by keeping the matter open, and getting the people interested in the subject, will help along our fishiog interest greatly, I believe. C. O. G.

THE DISPLAY OF AQUARIA IN THE AGRICULTURAL BUILDING.

[*From the Philadelphia Bulletin.*]

Among the many attractive displays is that of the Department of Aquaria on the west side of the building. It is in charge of Prof. Fred. Mather, who is thoroughly posted in fish culture, and it has been arraoged not only for the interest of the fish-breeder, but for the gratificatiou of the people and the study of the naturalist. The display is contained in thirty-five large tanks and aquaria, one tank alone being twenty-three feet long by seven wide and four deep. They are divided in three classes—those for salt water specimeos, those for fresh water, and the third for cold water fish. To supply salt water, a tank, capable of holding some ten thousand gallons, has been built outside the building, and brought from the Atlantic by way of the Camden and Atlantic Railroad. Frosh water, of course, is plentiful, but to keep cold water fishes properly, the water before reaching the aquarium passes through a coil of lead pipe packed in a box of ice.

The specimens of fish include not only the edible but other species, and some of them quite singular lookiog. The water in the tanks, etc., is kept properly replenished by means of a small steam engine, while several of the aquaria contain plants in such quantities as to preserve a perfect adjustment of the relations between the animal and vegetable kingdom, so that there is no need of replenishing the water.

The collection of fish is not quite complete, but will be in a short time. The British Commission have despatched a large tank to Bermuda to bring back some of the curious fishes and corals found there. Amoog them will be angel sharks, brainstones, madrapores, and other corals, etc. A tank has also been sent to the Atlantic coast, and will return with specimens of sharks and other sea-water fish. Besides these it is expected shortly to have a specimen of a catfish weighing over one hundred pounds, and other fish from the Mississippi basio, to be furnished by Messrs. J. W. Peters & Co., of St. Louis, while the local (Delaware) fishes will be furnished by Mr. Rutan, of Gloucester.

Later in the season the hatching process will be illustrated, when trout and salmon begin to spawn. Several of the foreiog machines are already on exhibition.

Among the specimens now on exhibitiou is an aquarium containing about a dozen crabs, and the creatures seem to skip around as if there were no cares nor Centennials in the world. Then come specimens of the big king crab, or horse-foot, so-called from its resemblnoce to the horse's hoof. Its movements can be easily seen through the glass, and its habits well studied.

After these come numerous specimens of terrapin, one aquarium alone containing about twenty-five, who from their lazy movements seem to take the world easy. In the largest tank are kept a number of green turtles, the heaviest weighing over three hundred pounds—an immense fellow, with a big thick head, and long, white flappers. In the line of toad fish there are about a dozen specimens. They are curious enough looking, and yet seem just as contented as the Centennial as when taken from their homes.

Of the fresh water eels, some very fine specimens are shown; also, of lake sheepshead or fresh water drum, and rock bass. Then come specimens of graylings in large numbers from Michigan, and Oswego bass or Southern chub.

Perhaps the most curious looking creature is a specimen of the hell-bender, an ugly, repulsive-looking establishmeot belonging to the family of salamandridæ. The ooe on exhibition is about twelve or fifteeo inches long, and has no sturnum. The ribs are rudimeotary, the legs or fios are four in oumber with four fingers each. The salamaodridæ have wonderful recuperative powers. The limbs may be removed, and in less than a year they will grow agaio.

There are shown long-finned chub-suekers, black gill sun-fish, large black bass, and moon-eye fish or lake herring. In one aquarium are gathered hundreds of small specimens of California salmoo, the eggs of which were sent from Califoroia to the United States Commissioner, and hatched at Marietta, in Pennsylvania.

In addition to those named, there will soon be exhibited specimens of sturgeon; also trout from the great lakes, and a lot of fresh water fish, to be furnished by the Ohio and Michigan Fish Commissioners. An assistant of the Aquaria Department of the Exhibition is now in Ohio in connection with the matter.

Prof. Mather also has in charge a number of bottles containing the spawn of shad, youog lobsters, and a number of specimens of fresh water insects injurious to fish culture.

The exhibit already attracts large numbers of visitors, and when it is completed it will be one of the most interesting features of the Agricultural Building.

TROUT CULTURE IN A NEW FIELD WITH FAIR SUCCESS.

BOSCOBEL, Wis.

EDITOR FOREST AND STREAM:—

In January, 1875, Mr. A. Wall left my ponds with twenty thousand trout eggs for Knoxville, Tenn. Owing to preparations for hatching he lost a large number of them. In January, 1876, I sent him twenty-five thousand more. I received a letter from him a few weeks since, saying that he had from six to eight thousand trout from the eggs running from five to ten inches long, and twenty thousand healthy fry from the last lot of spawn. It will be noticed by fish culturists that the yearlings had grown more rapidly than they do farther north. This I attribute to a higher degree of temperature in his water, the spring running as high as fifty-six in cold weather.

To show me how rapidly fish grew there he sent a California salmon five months old nearly five inches long and fully twice as large as my largest thongh of the same age. A. PALMER.

Natural History.

[*This Department is under the charge of a competent Naturalist, tutored by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.*]

BIRDS OF LOWER MICHIGAN.

BY A. B. COVERT, OF ANN ARBOR.

(*Continued from Page* 266.)

FAMILY TYRANNIDÆ.

Tyrannus carolinensis. Kingbird. A common visitor, arriving from the south about April 20th. The nest is built by June 10th. It departs southward by the middle of September.

Myiarchus crinitus. Great-crested flycatcher. Very common in summer, arriving from the south by the 10th of May. The eggs are laid about June 10th. It sometimes rears two broods in the seasoo, and departs in the fall by October 15th.

Sayornis fuscus. Phœbe-bird. Very commoo, coming from the south about the 1st of April. The nest is built about June 1st. It rears two broods in the season, and leaves us for its southern home by the middle of Octoher.

? Contopus borealis. Olive-sided flycatcher. Rare, and not seen before May 20th. The nest is built by the 10th of June. By September 1st it goes south.

Contopus virens. Wood pewee. Abundant after first or second week in June. It remains a little later in autumn than the olive-sided.

? Empidonax acadicus. Green crested flycatcher. Very rare; one specimen taken Juoe 17th, 1874; no instanee recorded of its nest being found.

? Empidonax Traillii. Traill's flycateher. Not common, but arrives from the south by the middle of of May. The oest is built about June 10th, and early in September it moves southward.

? Empidonax minimus. Least flycatcher. Very common, arriving about the middle of April. The nest is built about May 25th.

? Empidonax flaviventris. Yellow-bellied flycatcher. Very rare; arrives about the 20th of April. Ooe nest was found by J. J. Jones, June 5th, 1873. It migrates southward in September with the precediog.

FAMILY CAPRIMULGIDÆ.

Antrostomus vociferus. Whippoorwill. Common after the middle of May. The eggs are laid about June 1st, and it departs for the south by the last of August.

Chordeiles virginianus. Night-hawk, or bull-bat. Also very common, arriving by the 10th of May, breeding about June 1st, and following the whippoorwill south.

FAMILY CYPSELIDÆ.

Chætura pelasgia. Chimney swift. Abundant after its arrival on the last days of April. Its home is finished by the last week in May. It early leaves for the south, few being seeo after September 1st.

FAMILY TROCHILIDÆ.

Trochilus colubris. Ruby-throated humming-bird. This beautiful little gem is a very common summer visitor, arriving here by the middle of May. The nest is built about the 10th of Juoe. About the middle of September they depart in parties of four to six for their southern home, from which they seem while here hardly more than wanderers, so commonly do we associate gaudy plumage with a tropical clime.

FAMILY ALCEDINIDÆ.

Ceryle alcyon. Belted kingfisher. In pleuty, arriving by April 1st. The eggs are laid about the 1st of May. Departing mainly for the south about the middle of September, a few remain still later, and sometimes all winter.

FAMILY CUCULIDÆ.

Coccyzus erythrophthalmus. Black-hilled cuckoo. Very common after May 10, the males preceding the females about ten days. The nest is built by May 20th, and the cuckoo is ready to start south by the middle of September.

Coccyzus americanus. Yellow-billed-cuekoo. Very rare; arrives from the south by May 1st, the males preeeding the females as with the black-billed. The young appear about the 10th of June, and all go southward by the middle of September.

MAXIMUM LENGTH OF THE BLACK SNAKE.—In the last number of FOREST AND STREAM Dr. Abbott inquires as to the maximum length of the black snake (*Bascanion constrictor*). In Southern Illinois, where a few years ago many species of snake were abundant, this species was one of the most numerous; specimens of six feet in length were not uncommon, but I cannot affirm that this length was much exceeded. I have, however, information from an entirely trustworthy friend of the capture of a black snake which measured ten feet or thereabouts in length, it having been picked up by the informant, who mistook it for a charred fence rail. It is probable, however, that the specimen referred to was an Alleghany black snake (*Coluber obsoletus* Say; *Scotophis alleghaniensis* Baird and Girard*), which measured eleven feet in length†. My father killed one in Southern Illinois which measured nine feet in length, and I have killed several which were upwards of eight feet long, one of them having a half grown hare (*Lepus sylvestris*) in his stomach. R. RIDGWAY.

—In respect to the greatest length of the black snake, I would state that I have a specimen that measures a little over seven feet; and that I saw one killed that measured eight feet. These are the longest that I have ever seen, although I have heard of much longer ones being killed.—W. F. H. GETTY (Yonkers, N. Y.)

—In the summer of 1867 I found in woodcock coverts a black snake coiled in a circle and showing fight. Having shot the snake I picked him up, but although I stand six feet in my stockiogs, I could not hold him high enough by his tail for his head to clear the ground. I estimated the snake's length at seven feet and nine inches, and it was larger round than my wrist, I have since then killed a few over six feet in length.—E. H. A. (Litchfield Co., Conn.)

—A black soake was killed by Prof. Horsford upon Mt. Tom near this city a few years ago which measured a trifle over eight feet in length. Seven red squirrels were taken from its stomach. The skiu has been preserved.—FRED H. KEYES (Springfield, Mass.)

*See "Check List of North American Batrachia and Reptilia by Edward Cope."

†In the text the length is stated as "eleven *inches*—the largest I ever saw"—an evident error. [See Smithsonian Report, 1874, p. 433.]

ARCHÆOLOGICAL CONGRESS.—It is proposed to hold an International Convention of Archæologists at Philadelphia during the Expositioo, for the purpose of promoting acquaintance and increasing the means of information in American archæology and ethoology. The first meeting will be held in the Ohio buildiog on September 4th, at the closo of the American Association for the Advancement of Seience in Buffalo. Addresses from prominent anthropologists will be delivered, and it is hoped that a great impetus to investigations in this country will be gained. The call is signed by Dr. C. C. Abbott, Prof. Baird, F. W. Putnam, S. S. Haldman, Charles Rau, J. W. Dawson, C. C. Jones, S. D. Peet, Wm. B. Sloan, and others.

—Dr. Coues writes to the "American Naturalist" that Dr. Rufus Raymond, of Brookeville, Ind., has found a bank swallow buildiog her nest under a building which was built over the water, enteriog to her nest through a two-inch auger hole. This is the first recorded instance of its abandooing its fossorial habit, although its brother, the rough-winged swallow, frequently does so.

SPRING BIRDS OF VERMONT.

FERRISBURGH, Addis on Co., Vt., May 31st.

EDITOR FOREST AND STREAM:—

I send you the appended notes of my observations of the coming of the birds. Being no ornithologist, I have seen several which I could not name, and have set down none but those whose identity I was sure of:—

March 14th.—Cold north wind; saw 30 or 40 crows flying northward; in ordinary winters we have no crows here, but the past one having been unusually mild, individuals have been seen from time to time. 17th—Snowing a great deal; have seen more snow buntings this afternoon than in all winter. 27th—Saw a song sparrow. 28th—Saw five wild geese going north. 30th—Heard a blue-bird, and saw a robin. My brother saw 80 or 90 wild geese flying *southward*.

April 1st.—Saw another song sparrow about a bush heap, tuning his pipes in spite of northerly wind and snowy weather. 4th—A good many robins about, although it is snowing fast; a flock of black-birds. 5th—Saw a phœbe-bird; song sparrows plenty. 9th—Heard a meadow lark, and a downy woodpecker with strange voice almost exactly like the chuckling of a red squirrel; a sparrow hawk seen. 12th—Saw many swallows about Little Otter Creek; J. Birket, who was trapping there, said he saw the first yesterday. 13th—Heard frogs and saw a snipe. 14th—Saw many song-birds, and at evening heard one hylu. 16th—Flushed a woodcock in the orchard. 18th—Saw a golden-winged woodpecker; heard ruffed grouse drumming. 22d—Snow-birds and tree sparrows are becoming less plenty. 22d—Saw a grouse drumming, and watched him till some noise alarmed him, when he walked away; it was after 4 P. M., and soon no more drumming was heard in the woods. No trailing arbutus is in blossom yet, but liver-leaf is in bloom

May 8th.—First bobolink heard. 9th—Baltimore oriole and Bartram's tattler; yellow-crowned warblers have been plenty for a week. 14th—Heard a wood or hermit thrush; liver-leaf is almost out of bloom; violets, Dutchmen's breeches and adder-tongues are in bluom. 20th—Saw a great-crested flycatcher. 21st—Dandelions beginning to blossom. Male bobolinks plenty, but saw no females yet. 23d—Saw two pairs of scarlet tanagers; heard a ruffed grouse drumming. 25th—Heard a night hawk. 28th—Saw a humming-bird, and heard of one being seen a week ago. 31st.—Saw a red-headed woodpecker, the first I have seen for three or four years. Twenty-five years ago it was not at all uncommon here. The golden-winged, hairy, and downy woodpeckers are not nearly so plenty as they need to be, but are still not uncommon. It is easier to account for the decrease of these birds than of some others, such as the common wren, which was once as plenty here as almost any of our small birds, but is now never seen, and the Bartram's tattler, which not many years ago bred in goodly numbers in our meadows and pastures, but is becoming scarcer [illegible] year. The cutting off of the forests has greatly shortened [illegible] many of the woodpeckers, but

there can be no lack of food for wrens, nor for tatlers. Baltimore orioles are much plentier of late years than they were thirty years ago, when the sight of one was an event in the lives of us youngsters. At least half a dozen pairs build within thirty rods of our house every year now.

June 1st.—Heard a cuckoo. R. E. ROBINSON.

A PERSECUTED ORNITHOLOGIST.

MACHIAS, June 8th, 1876.

EDITOR FOREST AND STREAM:—

I write to tell you of the scrape you have got me into by publishing my letter, and also the advantage of advertising in your columns. Every mail I receive, which is once a week, brings me from three to five letters from persons wanting eggs. My farm takes up my time so that I am not able to get them for them, but I have spoken to several fishermen to get them for me, and will supply them so far as I am able. But it is too late for most kinds. I believe I wrote something about the "flying place." I have made inquiry, and can tell more about it. A friend of mine was there one day last April, and he said he saw birds enough fly through that day to load a vessel of 200 tons. This is a large story, but from all I have heard about the place large numbers of birds fly through. The first that come, they say, are old, strong birds that fly high so that few are killed. Later in the season the young birds come along that do not fly so high and more are shot. I hear that a party from Portland were there a few days week before last, and bagged 340 birds. One of them, I hear, was President of the Grand Trunk Railroad. GILBERT LONGFELLOW.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Eleven gray gophers (*Spermophilus Franklini*). Presented. One screech owl (*Scops asio*). Presented by Rev. Edgar M. Levy, Phila. One alligator (*A lississippiensis*). Presented. One water snake (*Nerodia fasciata*). Presented by Jos. M. Wilson, Washington, D. C. Nine prairie dogs (*Cynomys ludovicianus*). Born in the Garden. One manatee or sea-cow (*Manatus americanus*). Presented. Forty-eight large bull frogs (*Rana pipiens*). Presented by Jno. H. Dusenbury, Phila. One loon (*Colymbus torquatus*). Presented by Adam Matsinger, Phila. Four beavers (*Castor canadensis*). Presented. ARTHUR E. BROWN, General Superintendent.

If a person swallows any poison whatever, or has fallen into convulsions from having overloaded the stomach, an instantaneous remedy, more efficient and applicable in a larger number of cases than half a dozen medicines we can now think of, is a heaping teaspoon of common salt, and as much ground mustard, stirred rapidly in a teacup of water, warm or cold, and swallowed instantly. It is scarcely down before it begins to come up, bringing with it the remaining contents of the stomach; and lest there be any remnant of a poison however small, let the white of an egg, or a teacup of strong coffee, be swallowed as soon as the stomach is quiet; because these very common articles nullify a larger number of virulent poisons than any medicines in the shops.

Sea and River Fishing.

FISH IN SEASON IN JUNE.

Trout, *Salmo fontinalis.*
Salmon, *Salmo salar.*
Salmon Trout, *Salmo confinis.*
Black Bass, *Micropterus nigricans.*
Shad, *Alosa.*
Land-locked Salmon, *Salmo Gloveri.*
Grayling, *Thymallus tricolor.*

For list of seasonable flies for June see our issue of June 8th.

FISH IN MARKET.—An inspection of the slabs in our various markets shows that choice fish of all kinds are in great abundance and selling at low prices. The new Intercolonial Railway now brings us salmon direct from the Restigouche. The first were received in refrigerator cars on Tuesday, coming consigned to E. G. Blackford. They were superb fish, weighing 15 pounds each, and as fresh as though out of the Penobscot. We quote: Striped bass, 15 to 20 cents per pound; bluefish, 10 cents; salmon, 18 cents; mackerel, 10 to 15 cents each; weakfish, 10 cents per pound; Spanish mackerel, 25 cents; green turtle, 12½ cents; terrapin, $12 per dozen; halibut, 15 cents per pound; haddock, 8 cents; kingfish, 25 cents; codfish, 8 cents; blackfish, 10 to 15 cents; flounders, 10 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 12 cents; soft clams, 30 to 60 cents per 100; brook trout, $1 per pound; hard-shell crabs, $4 per 100; soft crabs, $1.25 per dozen; frog's legs, 45 cents per pound.

—Some fair catches of large weakfish have been made off Robin's Reef during the week. Bluefish have entered the Great South Bay in immense numbers, and large catches have been made both with squid and chum.

—The United States Centennial Commission announce an International Fly-casting Tournament on or about August 15th, to be held on the border of the lake in the Centennial grounds. An extended list of prizes, none of less value the $20 will be offered under the regulations of the New York State Sportsman's Association. It is proposed to have three separate tournaments, the first with single-handed trout rods; the second with two-handed salmon rods; and the third with the squid or spoon. The affair will be in charge of Mr. Fred Mather, Superintendent of Aquaria, Agricultural Department, Centennial Commission, who invites correspondence from all interested.

FISHING IN CANADA.—Certain persons in Rochester and elsewhere are making much ado, with many disparaging reflections upon the Canadians, because the Dominion Government charges one dollar for a permit to fish in Rice Lake and the lakes back of Peterborough, in Canada. We see no cause of objection to the charge. As Seth Green says in a letter to us, we have better fishing in our own waters. There will be good salmon-trout fishing in Cayuga, Seneca, Hemlock, Canandaigua, Skaneateles, Otsego, and Crooked lakes, and many others that have been stocked within the last three or four years. If the Canadians deem it politic to charge for their fishing they have a right to do so, and outsiders have no just cause of complaint. The fact is, that a permit is required by law for fishing in any Canadian waters in charge of overseers. A permit is required for the Nepigon, for instance, although it may not always be demanded. But the real cause for this action is lost sight of by the malcontents, namely: to prevent pot hunting, which has been carried on to a ruinous extent, in season and out of season, even in the far off Nepigon. By bringing all fishermen under surveillance, these abuses can be in part prevented. The regulation is certainly not more arbitrary than the laws of Kansas, Florida, and, we believe, of Maine, which prohibits the carrying of certain kinds of game out of the State. We could wish our own Government were more alert and efficient in the protection of our own rivers. Rice Lake is a charming place to visit, but as the muscalonge and black bass—its only game fishes—spawn in spring, they are not in good condition until August, and better in September.

AN AQUA-SCUTEM.—A small water-proof cape, such as can be folded into a small compass and carried comfortably in the pocket is sometimes a great comfort while fishing. The lower portion of the body is either wet intentionally or protected by wading stockings; but in case of sudden showers the shoulders suffer. Mr. Wakeman Holberton, of Messrs. Eaton, Holberton, & Co., has invented a water-proof cape which is manufactured by his firm and which seems to answer the purpose exactly.

A CHANCE FOR A PRIZE.—Messrs. Conroy Bissett & Mallison offer as premiums for the largest weak-fish and striped bass caught with rod and reel (not trolling) in the waters adjacent to New York during this season, a handsome German silver 200 yard reel, and a fine German silver bass rod. All fish are to be taken to their store and weighed. The prizes are now on exhibition and gentlemen are invited to call at No. 65 Fulton street, and register their names.

—Restigouche salmon are finding their way into the Boston market in large quantities since the opening of the Intercolonial Railway.

—Shad have been very plentiful in the Lower Miramichi the present spring.

—The Key West *Dispatch* claims that the entire fishing trade of that port amounts to $125,000 a year.

—Black-bass are taken to some extent in the Delaware at Milford, Pike county, about fifty miles above Easton.

—The jury on agricultural machinery at the Centennial Exhibition have decided to abandon the old practice of field trials, believing that no fair estimate of the value of machines can be formed from such trials. The quality of durability, for instance, which is one of the most important in a competition of reapers, plows, &c., cannot be ascertained at all by a single exhibition of their working. The jury will therefore merely examine the machines as they stand in Agricultural Hall, and will recommend such makes as seem to them to combine the most improvements.

For like reasons it is equally difficult, as we have already stated, to determine the superiority of fishing rods by fly-casting contests only.

—The schooner Golden West arrived at New London the 6th from the South Sea, with 2,600 South Sea seal skins and 460 Cape Horn skins. Her owners are happy. She has been out eleven months, and has not lost a single man or met with a disaster. The South Sea seal skins are considered equal to the South Shetland skins, and are worth $20 each, while the Cape Horn skins only sell from $7 to $8. Nearly all the seal skins are exported to London, England being the best market.

—The herring fishery off the Canada coast this spring has been most successful, the fish being more abundant than for many years. Ninety vessels loaded in a short time, thirty-two cargoes being shipped to the United States and fifty-seven to Denmark. Codfish and mackerel have replaced the herring and are plentiful.

MAINE—*Machias, June.*—Black fish and brook trout plenty. Game Association about putting black bass in the lakes now filled with pickerel. One salmon caught with fly at Dennysville last week, several at East Machias with dip net. Good season thus far for grouse, deer signs plenty in woods. We hope for more fun in future, for sportsmen seem now to be interested in game protection.

S. B. H.

MASSACHUSETTS—*New Bedford, June 16th,*—Blue-fish are plenty and our lower harbor affords fine sport in taking them. Sword fishing is now in season. The smack D. B. Mayhew, brought in seventeen, caught yesterday. The Cuttyhunk Club house opens this week and then there will be large bass to be seen coming over on the little steamer that runs from here to Cuttyhunk twice a week.

CONCHA.

CONNECTICUT—*Bridgeport, June 16th.*—A friend of mine tried the striped bass at Niantic, Ct., a few days since—caught five fish—one four pounds, one four and a quarter pounds, one five pounds, and two six pounds weight each. They have not struck in very much yet, but soon there will be fine fishing there. Three gentlemen went Friday last to Deep Water Rock, near the light house in Black Rock Harbor, for black-fish. They brought home fifty-two fish ranging from one to four pounds. One was caught which turned the scales at eight and a half pounds. We called this very fair fishing. A blue-fish was caught in a seine last week in our harbor weighing ten and a half pounds. This is extraordinary for this part of the Sound.

J.

NEW JERSEY—*Barnegat Inlet—Kinsey's Ashley House, June 12th.*—A Purvis, Philadelphia, 4 sheepshead, 26 sea bass, being first sheepshead of the season. June 13th. A Purvis, 66 sea bass and black-fish, 12 sheepshead; John P. Tunddell, E. B. Tunddell, J. L. Tunddell, Philadelphia, 26 blue fish; Joel Ridgeway and party, 55 blue-fish; J. C. McCurdy & Co., of Philadelphia, 60 blue-fish; Jr. R. Agnew & Co., Philadelphia, 68 blue-fish. June 14th. A Purvis, 13 sheepshead; professional fisherman, from 5 to 12 sheepshead each. June 15th. A Purvis, 20 sheepshead; professionals, from 5 to 17 each; blue-fish not biting, best boat, West & Co., Philadelphia, 13. June 16th. J. C. McCurdy & Co., 29 blue-fish, the only catch worth reporting; R. S. Laquier, N. Y., and A. Purvis, 7 sheepshead; P. P. Gustine, Jacob Fries, and H. Myers, Philadelphia, 26 sheepshead; about 125 by professionals. June 17th. W. P. Biddle, J. A. Jones, S. Law, and Capt. Grim, 50 blue-fish; Jas. Willcox, Philadelphia, 30 blue-fish; R. Laquier, N. Y., 7 sheepshead; P. P. Gustine & Co., Philadelphia, 45 sheepshead; by professionals about 150 sheepshead. Mr. John Krider has established a bulletin board at his sportsmen's depot, 2d and Walnut streets, Philadelphia, where daily telegrams are received from Barnegat Inlet, quoting the catches of fish at that point. It will be of great benefit to the Philadelphia sportsmen. B.

—As far as I can learn there seems to be little disposition to violate the shad fishing law on the Delaware. I believe further that this arises from a *decided disposition* on the part of fish wardens and a few others to make it hot for violators. The disposition to enforce the law is stronger, I think, in Jersey than Pennsylvania. Small rock and perch bite freely in the streams flowing into the Delaware from the Bay to Trenton. Bass are more plentiful in the Schuylkill this year than last, the average catch being better in numbers and weight. SCULLS.

CANADA—*Chatham, N. B., June 17th.*—Quite a large number of anglers have evisited Indiantown within the past fortnight for the purpose of killing the famous sea trout that frequent the waters of the Southwest Miramichi at that place. On Friday and Saturday last about a dozen rods could be counted within a distance of half a mile along the bank of the river. The weather was not favorable as there was more or less rain both days, and the run of fish was the poorest that has been known at Indiantown for several years at a corresponding date. A good many trout and salmon were taken, however, the trout being of fair average size and the salmon of mixed quality—black and spring. The luckiest rods killed fifteen to eighteen trout and one or two salmon a day, while the others did not get satisfactory fares. The trout caught during the two days ranged from one to three and a half pounds in weight, and the salmon, of which Mr. Orr captured four or five with his own rod, averaged about ten pounds each. We believe that the comparative scarcity of trout at Indiantown is due to the fact that the season has been very backward.

FISHING MOVEMENTS.—We notice considerable activity in the mackerel market the past week, the number of arrivals being 22, with fares ranging from 50 to 300 barrels. Mackerel have put in an appearance off shore, and operations were quite lively the first of this week. The receipts for the week have been about 2,000 bbls., with a lively demand and a competition among commission buyers that gave a healthy tone to the market, prices ranging from $8 to $11 per bbl., as to quality. The receipts of Bank fish have been small, the number of arrivals reported being 5 from Grand and 1 from Western Banks, with a total catch of 65,000 lbs. cod and 320,000 lbs. halibut. Prices have been well maintained. Georges have been in fair receipt, but the weather has been unfavorable for curing. We notice a slight downward tendency in prices, but no break of any consequence yet, and shipments are made daily at former quotations. The number of Georges arrivals for the week has been 63, and the receipts 930,000 lbs. cod-fish and 130,000 lbs. halibut. One vessel has arrived from the Magdalen Islands, with a full fare of pickled herring. Total number of fishing arrivals for the week, 91.—*Cape Ann Advertiser, June 16th.*

COCK-ROACHES FOR BASS BAIT.

WASHINGTON, D. C., June 16th, 1876.

EDITOR FOREST AND STREAM:—

Thinking you would like to hear a good joke, I send the following. While fishing for bass near Washington, a gentleman who I think never fished for bass before, asked if we ever used roach for bait. We answered yes, and forthwith he pulled out of his pocket a bottle filled with cock-roaches. Well, if we did'nt yell, you bet. He asked why we were laughing. We told him, and showed him the difference. He wiped his face and packed up, and went home to whip some one. G. W

The Kennel.

RETRIEVING.

AMONG the most important matters in the breaking of dogs to shoot over is, that they should be properly find and retrieve the fallen birds. Nothing mars the pleasure of a day's shooting more than to be compelled to leave behind us a dead or wounded bird; and this trouble would very rarely arise if proper judgment is exercised in breaking. The mistake that most shooters make is, that in their haste to secure the fallen bird they will walk directly over the ground where it has fallen with game about them which fills the air with the scent, and consequently the dog at once becomes confused with it, and may run directly over the dead bird without finding it.

A skillful sportsman never makes an attempt to secure a fallen bird until he has reloaded his gun, and then he never walks over the ground to help his dog find it, but will keep him down, or standing quietly near him until he is ordered to "seek dead." If the bird is shot directly down wind, the shooter should, by all means, get to leeward of the shot before he sends his dog for it. And then, too, he should be very careful by no word or movement to excite his dog to quick action. When a dog is near the place where the bird has fallen the slower he moves the sooner he will find it; we mean with dogs which have been properly broken to this accomplishment. No one can ever have a first-class retrieving dog who will walk over the ground and help his dog look for the bird, because a dog thus improperly worked will soon neglect to use his nose, and depend, in a great measure, upon his master to find his birds. And then again, another very great mistake is frequently made by shooters which is, while the dog is trying to find the bird, to pick it up and walk off with it, leaving the dog looking for it. We have seen this done over and over again. No dog thus managed ever becomes a first-class retriever. We have owned many setters and pointers who would never fail to find a dead or wounded bird, unless it got under a rack, stump, or some place where the dog could not go. Another great mistake is

made by most sportsmen, which is to send two or three dogs to find a dead or wounded bird; no two or three dogs can find a bird in one-fourth the time that one good dog will do it, as they become jealous of each other, and instead of using their noses they watch each other, and if the bird is found at all they waste much time in doing it. A dog with a good nose, skillfully broken to retrieve, never uses his eyes to find the fallen bird, but steadily applies his nose to wind it, and never fails. If a bird is only wounded, as many are, and runs to cover and hides, the eyes of the dog or shooter are of no use in finding it. Everything depends upon the dog's nose, and nothing whatever should be done to confuse him while at his difficult task, for if left to his own instinct a good dog will surely succeed.

THE KENNEL REGISTER.

THE following is a list of dogs entered in the Kennel Register since the publication of the last list and up to Tuesday last. We have certificates ready to forward for Mr. Topham's Brisk, Mr. E. H. Nicoll's Bang, and Mr. D. G. Elliot's Left, but have not the addresses of those gentlemen.—

SETTERS.

Ethan Allin's Clum, Cosey, Pansy and Trusty.
Dr. Aten's Belle, Fanny, Glen, Ned.
Mr. D. C. Sanborn's Neli.
Mr. H. A. Topham's Brisk.
Dr. H. A. Rosenthal's Sport, Dash and Flora.
Mr. E. M. Huff's May.
Mr. E. A. Herzberg's Ace and Jessie.
Mr. W. J. Conover's Vic.
Dr. W. E. Burger's Lady.
Mr. Lawrence Sinster, Jr.'s Jerry.
Mr. J. Aretas Clark's Frank.
Mr. E. Haidekoper's San Migne1.
Mr. A. Branshaw's (late Mr. Wm. Jarvis') Shamrock.
Messrs. Tousey & Graves' Tip, Port Hudson and Neptune.

POINTERS.

Mr. D. Knoble, Jr.'s Viley.
Mr. D. B. Fuller's Queen.
Mr. Charles S. Austin's Pete II.

CLUMBERS

Mr. Benjamin Smith's Bess and Buster.

RETRIEVERS.

Mr. D. G. Elliott's Left.

KENNEL PRODUCE.—Mr. John E. Develin's, imported red Irish setter bitch, Moya, who visited Plunkitt in March, as mentioned in our paper, whelped eleven fine pups on the 26th ult., at the kennel of Mr. David G. Hartt, North Port, L. I., and on the 9th inst. Mr. D.'s red Irish setter bitch Mollie visited Plunkitt at Bennington, Vt.

— Mr. A. Branshaw, of Fon du lac, Wis., has purchased from Mr. Wm. Jarvis his red Irish setter dog Shamrock. Mr. Branshaw takes Shamrock to Texas with him in the fall, together with an equally good bitch to mate with him. The Texans are to be congratulated upon this importation of pure blood, the results of which will no doubt soon be manifest. The Irish setter is well adapted for Texan shooting, having both high courage and great endurance.

REMEDY FOR FLEAS.—A corrsspondent writes:—

"In your Answers to Correspondents, Geo. H., Grantville, Mass., asks for the easiest and surest remedy for fleas on dogs. Five cents worth of Persian insect powder will rid a large dog of every flea, and it requires no washing."

DOG POISONING IN CONNECTICUT.—A Bridgeport correspondent writes, June 16th:—

"Some one has taken upon himself to poison every dog hereabouts. He scatters meat with poison in it at night, and during the day; any unfortunate dog that picks it up forthwith 'turns his toes up.' Several very valuable dogs have been destroyed already. This has been going on for three weeks, and fifty or sixty dogs have vanished. Large rewards are offered to find out who does it, but to no avail. Various speculations are afloat as to the objects of such wholesale slaughter.

DOCKING DOG'S TAILS.

NEW YORK, June 16th, 1876.

EDITOR FOREST AND STREAM:—

Allow me to make a suggestion in reference to the docking of dog's tails, and especially those of pointers. In the issue of June 8th you say: "There is nothing which detracts so much from the beauty of a pointer as a very long crooked tail. We have met with pointers having very long tails, with the skin completely whipped off the end for two or three inches. To work a dog thus is not only cruelty, but the dog being in constant pain does not work as well as he would with a good sound tail of proper length." With the above I agree perfectly; but when you suggest as a remedy the docking of the dog's tail, I beg leave to differ. To be sure it is a remedy but only palliative, for in the progeny it will again occur, and continue to occur as dogs are bred now days. A better remedy is, I think, to endeavor to improve the tails by breeding, as we now improve the nose, color, pace, style, etc. It is a slow method, but if persevered in one that will be likely to succeed; and after all what is the trouble when compared to the magnificent result? Now, as to the mode of compelling people to breed such dogs. At present two methods appear to me, both of which are feasible—one is, let the managers of our future bench shows refuse to award a first prize to any dog with docked tail; five years from now they can refuse second premium, and ten years hence third premium. The other is to let a dog compete; but should his tail be docked, let him receive 0 number of mark for it. The result would be that persons having a bitch to breed would look about for a dog with a short straight tail, and not as is too frequently now done, breed to any club-tailed animal that has good action and a good nose. The very word bench show means that a dog shall be judged upon according to his looks, and not for his qualities in the field. For those dogs we have the field trials, in which a dog may compete and win no matter how ugly and deformed he is; but in a bench show no dog with docked tail should be allowed first prize, or else he should receive a number of marks for it; for it was undoubtedly taken off to conceal a long, crooked, turned up tail, which to me is a clear evidence of impure breeding among some of his ancestors. The little care and regard given to the appearance of a dog's tail was most forcibly brought to my mind at the last Springfield Bench Show in this manner: A prominent gentleman of the Rod and Gun Club said to me: "How is your black pointer pup?" I replied, "He has turned out very poorly, he has the ugliest crook in his tail I ever saw, but in every other respect is all I could wish." He remarked: "Pshaw! a dog don't hunt with his tail, does he? What do you care, provided he does his work well?" Now, I would not care, provided that was the only virtue I required in a dog; but as I can only shoot a few months, and sometimes only a few weeks in the year, and as a dog is a constant companion I would not wish him to be a constant eye-sore to both myself and friends. Many persons remarked during the bench show and since that if I had only cut my black pointer's tail he would have stood a good chance of taking a prize, and I think myself he would; but certainly he would not have been entitled to it, because I had hidden his defect by amputation, any more than if I had exhibited a dropper and pulled out the long hair in his neck, stern, and tail to hide his breed. In England they will not allow a dog with a docked tail to compete, and the result is that they have plenty of dogs with good tails.

Mr. Editor, if my suggestions be not acceptable to the majority of careful-thinking sportsmen, I hope you will make one which will compel those who breed dogs to breed a better specimen of the American pointer. As to their working qualities there are none better, and it is to be expected, as they have been bred solely with that end in view and no attention whatever paid to their appearance. GROUSE.

The remedy suggested by our correspondent should be adopted when breeding, not only with pointers but with setters, as we are fully convinced that by adopting this course we will get rid of the unseemly appendage that too many of the high-bred dogs of the present day are affected with. This is a matter we have always taken into consideration in breeding dogs, and with much success. From our old Bruce, a famous orange and white Gildersleeve setter, from Old Grouse and Chief Justice Beasley's Rolla, from R. A. Drake's Rock, from Hammitt's Echo, and our fine imported bitches Cora and Fly we bred for years, and their progeny scarcely ever failed to have straight, well-feathered tails which required no docking. It is true a dog does not hunt with his tail; yet certainly he does not hunt any better from having a long, crooked, coarse, ungainly one, and with our correspondent we could hardly be conteuted to have such an animal about us.

THE CENTENNIAL BENCH SHOW.

PORTLAND, Me., June, 1876.

EDITOR FOREST AND STREAM:—

I wish to indorse your criticism of the clause in the programme of the International Bench Show that makes a pedigree obligatory, for the same reason that I advocate the prizes being awarded before the show is open to the public—that is, it is one more element conducive to the awards being made exclusively upon the personal merits of the animals, and not upon the reputation of ancestors, nor upon the opinions of others, even though they may have been judges at previous bench shows. The questions asked by "Doubter;" in FOREST AND STREAM of June 15th were suggested by the idea of entering dogs as American setters or pointers, no pedigrees being given below awards, and in no case obligatory. After awards are made it should be optional with owners to give pedigrees. In the programme referred to there is no class for American setters to be entered under except Class 5; yet Gordon setters and Irish setters have each a class, and if English setters and Russian setters include only those bred in England or Russia, or whose pedigrees were born there, what insignificant place is left to enter dogs bred in the United States, or I would say in North America, (not losing sight of the many fine dogs owned by our Canadian neighbors) and so bred as to produce a strain of fine form, color, and other qualities, yet whose pedigrees can only be correctly given for one or two generations. The result would be inevitable, if every pedigree in this country could be traced back far enough, that the ancestors were brought from England; and in case of a strain being produced of marked desirable peculiarities the owner of the kennel might not wish to give away his secret by publishing pedigrees. Let us not, then, make it obligatory to give pedigrees at our bench shows, and I would also make pedigrees inadmissible until after the awards are made, agreeing with you that the standpoint of excellence should be formed and judged upon "by the appearance and points of the animal exhibited," and if "descent from a celebrity is to be the standpoint of excellence, why not send the pedigree as a proxy and keep the dog at home?" How few sportsmen owning fine dogs feel fully competent to judge of their respective merits as seen on the bench, and with the mind in doubt a rose-colored pedigree would have influence; yet the *couleur de rose* may be artificial. In fact, there is so much room for deception in the matter of pedigrees that they should not be allowed to influence the awards, intentionally or otherwise, except it be in a special class making them admissible; and I hope that the entire absence of pedigrees until after the awards are made may be a feature of future bench shows. ROAMER.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

June 28	4 36	1 24	morn. 36

WILLIAMSBURGH YACHT CLUB.—The annual regatta of this club was sailed on Tuesday week, the course being from the anchorage off the club house at the foot of Eagle street, Greenpoint, up the east side of Blackwell's Island, through Hell Gate, between the North and South Brother Islands to the Stepping Stones Buoy and return, the entire distance being twenty-four miles. The judges were Hon. Bernard Silverman, Mr. John Orr, and Mr. Joseph A. Lyons. The entries and results of the race are shown in the following table:—

CABIN SLOOPS.

Yacht.	Actual time.	Corrected time.
Favorita	3 32 15	3 32 15
Chester Arthur	3 51 45	3 33 45
OPEN SLOOPS—FIRST CLASS.		
Greenpoint	3 26 15	3 26 15
Nettie	3 32 15	3 32 15
Endeavor	3 52 00	3 52 00
SECOND CLASS.		
Pluck and Luck	3 28 30	3 28 30
Artful Dodger	3 54 00	3 32 00
THIRD CLASS.		
Mary Gibson	3 49 15	3 49 15
J. N. Lauther	4 03 30	4 03 30
Rosina	4 05 00	4 05 00

The race and club colors were won by the Pluck and Luck, while the Favorita, Greenpoint and Mary Gibson won in the other three classes.

—The annual regatta of the Toms River Yacht Club takes place July 5th. The prizes consist of, first, the challenge cup (now held by the yacht Cynthia, of New York); second prize, $20 gold piece; third, $20 gold piece; fourth, $10 gold piece.

JERSEY CITY YACHT CLUB.—It having been decided to sail the race between the first class yachts of the Jersey City Club again, owing to two of them having run aground on the occasion of the regatta on the 6th inst., the Plover, Mary, and Sea Spray sailed over the course again last week, with the following result:—

Name.	Start.	Finish.	Time.	Cor. Time.
	H. M. S.	H. M. S.	H. M. S.	H. M. S.
Plover	11 21 00	5 13 30	5 52 30	5 52 30
Mary	11 26 101	2 12 30	5 46 30	5 50 40
Sea Spray	11 21 30	Not timed.		

The Plover, when nearly up to Bedloe's Island, parted her preventer backstay, and the gauge carried her topmast over the side, which destroyed the chances.

—A match race for $200, was to have been sailed yesterday between the yachts Gilbert J. Orr of the Williamsburg Yacht Club, and the Jane of the Manhattan Yacht Club, the course being from foot of 104th street East River, to and around the Stepping Stone buoy.

—The statement made in our issue last week that the Idler had won the second prize in the first class in the recent schooner regatta of the Sewanhaka Yacht Club, was erroneous. The prize was really won by the Dreadnaught, beating the Idler 2m. and 2s. The mistake was owing to an error in noting the time of the latter yacht at the finish.

CENTRAL HUDSON YACHT CLUB.—The opening regatta of this club will be sailed on the 29th inst., and will be on the Corinthian principle. In addition to the regular prizes in each class, there will be given to the boat, irrespective of class, making the best corrected time over the entire course an extra prize, the gift of Mr. Philip Schuyler, of New York. It is a beautiful silk pennant twenty-five feet long, with the words "Corinthian Challenge Pennant, C. H. Y. C.," in white letters on a blue field, and it is to take the place in the club of the old challenge flag, known as the "Champion Pennant," to be always sailed for as a challenge flag, like the old one, but upon Corinthian principles.

The following yachts have been added to the club this season:—

W. R. Brown, 27 feet 5 inches; owned by C. F. Brown, W. R. Brown, and H. C. Higginson, Newburg. Belle, 35 feet; owned by B. Prince, Peekskill. Julie, 16 feet; owned by P. C. Rogers, Poughkeepsie. Osprey, 19 feet; owned by T. F. Balle, Newburg.

At the last general meeting the following officers were elected:—Commodore, Irving Grinnell, New Hamburg; Vice-Commodore, C. F. Brown, Newburg; Rear Commodore, J. R. Roosevelt, Poughkeepsie; Secretary, F. Schuchardt, New Hamburg; Treasurer, J. Van Wyck, Jr., New Hamburg; Measurer, A. Van Wyck, New Hamburg; Regatta Committee, Philip Schuyler, New York, James Roosevelt, Hyde Park, G. L. Rives, New Hamburg.

THE CENTENNIAL REGATTAS.—The first of the series of Centennial regattas, to be sailed under the supervision of the Centennial Regatta Committee, occurs to-day over the New York Yacht Club course. To-morrow (Friday) there will be another regatta for yachts under fifteen tons, and on Monday an ocean race from Sandy Hook to Cape May.

The yachts entered for the first race up to our going to press was the schooners Eva, Estelle, Alarm, and Tidal Wave; sloops Arrow, Windward, and Gracie. For Friday's race there are already twenty-one entries. For the ocean race the celebrated America is entered, as well as the Alarm, and Tidal Wave; also the sloops Arrow, Windward, and Gracie.

THE HARLEM REGATTA.—The fourth annual regatta of the Harlem Regatta Association was held on the Harlem River on Saturday last. Nearly all the clubs who have their headquarters at this point were entered, and sent their best representatives to row. The course for all the seven events on the programme was one mile straightaway from Gate's lumber dock to Florence's dock, McComb's Dam Bridge. Stake-boat No. 1 was anchored on the New York shore. No. 2, in mid-stream, and No. 3 on the Westchester shore, each contestant taking his position according to his entry. The referee was R. S. Bussing, Jr., of the Nereid Boat Club; the time-keeper and starter, C. G. Peters. The first race was for the junior sculls, rowed in heats, bringing out: H. W. Rodgers, of the Atalanta Club, white; W. Robinson, of the Nassau Club, red; D. W. Hernon, of the Nautilus Club, light blue. Rodgers was the favorite 2 to 1, and taking it very easily until near the finish he spurted ahead of Robinson and won in 6m. 51s.

The second race was for pair-oars, the Athletic, Atalanta, and Nautilus clubs each sending representatives. Downs and Eustis of the Atalantas winning in 6m. 7¾s.; Nautilus second, and Athletics third.

The third race was the second trial for the junior sculls, the contestants being J. D. Foot, of the Nassaus, Waldo Sprague, of the Athletics, Thos. Scanlon, and E. Mills, Jr., of the Atalantas. Sprague had the lead at the start, but was soon passed by Foot and Mills, the latter winning in 6m. 40s.

Three crews appeared for the four oared race, representing the Columbia, Atalanta and Athletic crews. This was a very closely contested race, the crews being as follows: Columbia—J. A. Sprague, bow; E. E. Sage, No. 2; C. S. Boyd, No. 3; J. T. Goodwin, stroke. Atalanta—Edward Blake, bow; H. W. Rodgers, No. 2; W. H. Downs, No. 3; J. E. Eustis, stroke. Athletic—R. W. Rathburn, bow; L. S. Mack, No. 2; H. C. West, No. 3; C. H. Cone, stroke. The Athletics had rather the best of the start, followed by the Columbias. The Atalantas, however, soon went to the front and the race was between them and the Columbias. Just before the finish the boats were almost side by side when a small steam launch ran into the Columbia's shell, crashing in the bow and bringing the boat to a full stop. This unfortunate accident occurred just at the most critical moment, and lost the Columbias the race, although they have appealed from the referee's decision to the Examining Committee. The Atalantas time was 5m. 20s.

The race for the diamond sculls brought out three well known oarsmen: Eben Losee, Atalanta; James Wills, Nassau; P. C. Ackerman, Atalanta. Ackerman won in 6m. 20s.

In the six-oared gig race, the Dauntless, N. Y. Rowing and Athletic Clubs, contested, the N. Y. Rowing Club winning in 5m. 27s. The Athletics only one second behind. In the final heat of the junior sculls, Rodgers, Foot, and Mills rowed, the first named winning in 6m. 23s.

SCHUYLKILL NAVY REGATTA.—The regatta of the Schuylkill Navy was held on Saturday, 17th instant, and the easier way to give your reader an idea of it would be to copy the New York *Herald*'s account of the Harlem regatta of

the same day. It was a failure, but I cannot see that for the failure the management is responsible. There was a strong southwest wind blowing all the afternoon, and the water was in no condition for shell rowing from the time announced for the regatta to commence. First on the programme was the single scull contest—a race promising much interest, but instead of seven starters, as I predicted last week, there were but five, all of whom were in position when the Umpire's boat came to the start. It was at once seen that it was impossible to row, the boats being already half filled with water, so the gig race was ordered. Only Quaker City and Crescents came to stake-boats, the Malta withdrawing. The Quakers' crew was as follows:—Stinson, stroke; Pleasonton; Ferguson; Wise, bow; Maybin, coxswain. Crescent's—Hinchman, stroke; Barnhurst; Terry; Ridgway, bow; Steel, coxswain. The Quakers seemed to have the advantage of the start, and held a slight lead until off Wm. Tell Rock, the boats met a canal barge. Maybin wisely decided to go under the rope, and kept close to the canal boat, but by bad steering he lost a couple of lengths. The Crescents, now with the race in hand, struck right across the river to find smooth water, and under any ordinary circumstances would have lost the race. The wind changing did flatten the water on the eastern side, (perhaps Steel is a friend of old Prob's), but still more in their favor was the perfectly reckless manner in which the coxswain of the Quakers' boat put his rudder first hard to port and then hard to starboard. No crew could stand pulling against a rudder all the time, and when the crews came past the island the Crescents were well ahead, winning by a couple of clear lengths.

There were no entries for either the double-scull or barge race except from the Crescent Club, so the two boats were started together for walk-overs, (or is it walks-over), for their respective classes. After a long wait for the Quaker City, to whom some consideration was due after their gig race, but which was trying to the two crews lying at the stakes, the four-oared shell race was started. The Pennsylvania crew:—Mussey, stroke; Conrad; Bennett; Kappes, bow. Colors—blue. East. Undine:—Baker, stroke; De Haven; Alleston; Roberts, bow. Colors—white. Centre. Quaker City:—McIleath, stroke; Pleasonton; Goomley; Stinson, bow. Colors—red. West.

The Undine led by half a length. Almost at once the Pennsylvanias dropped astern, and after a dozen strokes commenced paddling home, apparently completely out of temper. The high wind made steering very difficult, the Quakers' boat going wildly over the whole neighborhood. Roberts seemed to feel the same difficulty, but never for a moment losing his head, he brought the boat back at once, and began taking a look at the tail boats when half over the course. At the head of the island the race was not yet beyond doubt, but the case with which De Haven shot his crew ahead on the home stretch proved the leaders had "lots in 'em."

For the first time in a long period the Undines carry the first class champion flag. The victory will stimulate the club to further exertion, and on the other hand the Quakers' defeat will teach them that even a little of their old care and discipline cannot be abandoned without loss.

The Regatta Committee were Schmitt, of the Pennsylvania, Chairman Haines, of the Malta, and O'Neill, of the College. Vice-Commodore Hockley acted as umpire in the gig races, and Alex. Krumthoan for the shells.

The Vesper Club have challenged the Quaker City, Pennsylvania, Crescent, Maltas, and Undine clubs to a four-oared shell race. The Vesper should come into the Navy, and would then have a chance at some of these clubs.

The swimming contest bids fair to be a success on the 26th.

SCULLS.

—The citizens of Peoria, Ill., will celebrate the Fourth of July by a grand regatta on Peoria Lake. Four hundred and fifty dollars will be given in prizes for four races. The regatta will be under the auspices of the Peoria Boat Club.

THE "QUI VIVE" CANOE.

EAST ORANGE, June 10th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of the 8th inst. you publish a letter from Yarmouth, Nova Scotia, describing a canvas canoe. You treat the subject as though it was something entirely new. Now I have built no less than four canvass canoes, but the two built this spring are an improvement on any I have ever seen. They are elegant in shape, light and stiff, and do not leak a drop. The frame is made of ash. The main stringers are nine in number, and all outside of the ribs, so that everything that touches the skin runs fore and aft. This, and the style of building, also putting the canvas on without a seam below the gunwales, I claim to be the invention of. The six other stringers are then added, at proper distances, and firmly secured. The canoe is then turned over, and solid braces put in close to bow and stern. Fifteen cross ribs are then put in at proper distances and riveted with two copper tacks at each intersection with the stringers. While doing this the lines must be trued, as these ribs determine the shape of the canoe. The mast step is then put in, and fastened to the keelson and two ribs, also a piece of three-quarter inch pine board, from gunwale to gunwale, with a mast hole in it. Next the peaked earlines, or deck-supports are put in. The forms then removed, after which the well frame and combings are placed in position, and firmly screwed to the gunwales. The deck has a slope of two inches from well to bow and stern. When all the wood work is complete I give it a coat of paint, after which the skin, No. 10 cotton duck, is put on without a seam. Next I paint bow and stern, also along the keelson. While the paint is yet fresh I put on false bows of sheet iron and an inch pine keel, which latter is bolted through the skin to the keelson. Next the deck is put on, of lighter canvas, and then a coat of boiled linseed oil is given. Over the oil I paint, and finally varnish. I have repeatedly hauled the "Qui Vive" up the side of a duck or barge, and have sailed her over very rough water, yet she is as stiff and tight as ever. Any one with a correct eye, and a little skill with tools, can build a "Qui Vive" canoe. The dimensions are, length, 14ft.; beam, 26ins., depth amidships, from ridge of deck to bottom of one-inch keel, 9ft. The fittings are paddle, mast, two sails, apron, seatback, stretcher, flag, and flagstaff. I will contract to furnish a few canoes of this style next spring for $50 each, complete. The "Qui Vive" and "Delaware" may be seen at Bower's boat house, or the Tralons' on the Passaic, up to the 26th inst., when they start for the Centennial.

I. F. WEST.

POLO.—On Saturday last the second game of polo for the champion cup was played on the new grounds at Jerome Park, the sides being as follows:—

Blue and White.—J. G. Bennett, Aug. Jay, Wm. Jay, Dyson Moore, C. G. Franclyn.

Red and Blue.—Viscount Mandeville, S. S. Howland, F. Griswold, W. Douglass, Winthrop Thorne.

Ten games in all were played, resulting in a score of eight for Lord Mandeville's side, and only one for Mr. Bennett's, one game being declared void on account of a foul. The playing on the part of all engaged was remarkably fine, Messrs. Bennett, Douglass and Jay particularly distinguishing themselves.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

E. S. R., Rochester.—Where can I find good trout fishing on the Lehigh Valley road? Ans. Near Whitehaven in Luzerne Co., Pa. Good hotel at depot.

G. L., Machais, Me.—How does the Lefever gun compare with other guns same price? Ans. No better guns manufactured in the United States than the Lefever.

C. A. V. B., Guelph, Canada.—At what age do speckled trout begin to propagate their species, and what is their average size at that age? Ans. Two year old trout, say 6 inches in length.

G. B., New York.—Will you be so kind as to inform me what kind of fishing (this month) in the Thames River, Conn., also what kind of bait to use? Ans. Excellent striped bass fishing at Niantic now.

BORROWERS.—The persons who borrowed from the library of FOREST AND STREAM office Prime's "I Go-a-Fishing" and Ruxton's "Life in the Far West" will do themselves and us justice by returning them at once.

G. P., Ayer.—Where is the best place in Maine for netting pigeons in the months of August and September. Ans. Pigeons are uncertain in their roosting places and it is impossible to predict where they will be.

O. K., Richmond.—Where can I find a work on trapping and handling pigeons for matches? Ans. No work especially on handling and trapping. The Trap Shooter's Referee is the nearest approach; we can send it.

Dr. C. M. W., Lodiville.—Where and at what price can I get Dawson's book on fish and fishing? Ans. Sheldon & Co., New York, or Weed, Parsons & Co., Albany. Price $1.50. We can forward you a copy post paid.

G. W. P., Boston.—Will you please inform me where the best fishing, lake or brook trout, is found, and where I can get a set of trout hooks, flies, and rod the cheapest? Ans. The Rangely Lakes in Maine. Messrs. Bradford & Anthony of your city will fit you out.

E. G. F., Brattleboro, Vt.—Please inform me the names of and where can be obtained the best book on trout culture? "Domesticated Trout" by Livingston Stone, Osgood & Co., Boston; "Fish Culture," by Seth Green, Rochester, N. Y. Dr. Slack's book is very serviceable. Address Mrs. J. H. Slack Bloomsburg, N. J.

H. B. D., Albany, N. Y.—As you are familiar with sporting literature, will you please inform me if you know of a work entitled "Wild Sports in the West of Ireland," by Maxwell; where it can be bought, price, etc.? Ans. Messrs. Scribner & Co., No. 745 Broadway, had it some time since. We do not know the price.

C. E. C., F. L., N. Y.—1. Can you tell me how to catch black-birds for trap shooting? 2. Is there any difference between a cat-fish and a bull-head? Ans. 1. Use a pigeon clap net set near a grain stack, wherever the birds congregate in large flocks. 2. No difference between the common cat-fish (*Pimelodus catlus*) and the bull-head or horned pout.

F. A. C., Fall River, Mass.—Will trolling in a sail boat be too fast for black bass, or should I use a row boat? It is in a lake, and therefore no current. Should I use flies as well as the spoon bait, and what kind? Ans. Generally a sail boat runs too fast. Two miles an hour is the best speed. Use either fly or spoon; the latter is the best for general work.

W. P., Waverly, Md.—My setter dog, four years old, is affected with vomiting every two or three days. He is very thin, and his coat is dull, having lost the glossy appearance it used to have. Can the trouble be worms? And if so, where can I procure the famous areca nut? Ans. Have mailed to you the proper doses of areca nut with directions for its use.

E. OLIVER, Little Falls, N. Y.—Can you give me the address of any collectors of eggs with whom I can correspond? Ans. Nuttall Ornithological Club, care R. Deane, 80 Sparks street, Cambridge, Mass.; Chas. E. Aiken, Colorado Springs, Col.; D. H. Eaton, Peotone, Ill.; A. B. Covert, box 237, Ann Arbor, Mich.; G. E. Maingault, Mus. Nat. Hist., Charleston, S. C.

EXTRACTOR, Newton, Mass.—I have in my possession a finely made, double-barrel breech-loader, 12 bore, and 30 inches in length. A friend of mine has advised me to have my barrels reduced in length by two inches, claiming that the shooting qualities might be improved by so doing, also the ease in handling. Ans. We consider 30 inches as the best length for general shooting.

L. S., Union Club.—Can you give me any information relative to the Black Mountains of North Carolina, and the means of reaching there? Ans. To reach Black Mountain go to Johnson City on Virginia and East Tennessee Railroad. This region is quite famous for bears, and there are deer, ruffed grouse, wild turkeys, squirrels, and speckled trout, although we did not find as much game on our trip last fall as we expected.

G. R. W.—I expect to go West about the 1st August for the purpose of obtaining some prairie chicken shooting. Will you kindly give me some information as to localities, and also, if you can, the name and address of some reliable party whom I could communicate on the subject? I would prefer to shoot in Illinois? Ans. Address W. H. Holabird, Valparaiso, Indiana, or call upon him on your way out. If he cannot give you some shooting there he will direct you to a good point.

LEWIS, New York.—I should like to try my hand at fly casting, if I could go to any place within two hours of New York, where there is supposed to be some trout. I believe there are streams on Long Island. I would be willing to pay for the privilege. Ans. We will guarantee you a dozen good trout if you will take 9 o'clock train from Hunter's Point or Bushwick to Ridgewood, L. I.; distance 28 miles, returning in 4 P. M. train. Go to Edward H. Seaman, 30 minutes' walk from depot.

GEO. E. S., Hartford.—How can I tell if a Newfoundland pup is full bred? He is about seven months old and two feet one inch high. How long does he keep on growing? He has a little brown hair behind his ears and a little on his hind legs. Will that ever change to black? Ans. No one can tell that a dog is thoroughbred from his appearance. Many half-bred dogs have the appearance of full-breds. A dog seldom grows in height after he is a year old. The brown hair on your's will not change to black.

J. B., Vicksburgh, Miss.—1. I have a valuable setter dog two years old which has a dry hacking cough from which he seems to suffer very much when exercised. 2. Which is the best powder to use in No. 10-gauge, 30-inch Greener breech-loading shot gun, and how much? Ans. 1. Give your dog a tea-spoonful of syrup of squills twice a day when his cough is troublesome. 2. The powder advertised in our columns by different makers is of the best quality. The coarser grained is preferable, and from 3¼ to 4 drachms to 1¼ oz. shot is about right for your gun.

H. A. L.—I have a book by J. S. Skinner, entitled the "Dog and Sportsman," are the receipts reliable, and the work rare? In "the chapter on distemper he says he has found a complete cure, effected by copious and repeated venesection by a little opening medicine". What is venesection? Ans. The book you allude to is out of print and very rare; many of the receipts therein are good, but you will find better in our columns. Venesection is defined as the operation of opening a vein for letting blood. It is another name for phlebotomy, a little more genteel.

A READER, Middleton.—I have a small dog which had the misfortune to get scalded, taking a lot of his hair off. Is there any method by which the hair can be made to grow again? A friend said to burn an old shoe and mix the ashes with lard, keep the dog out of the sun, and put a muzzle on, and he would come out all right. Can you give me a better method, and one which would be more to the dog's comfort? Ans. We have never been able to restore the hair which has been taken off by scalding, but hope you will try the remedy you mention and give us the result, if successful.

J. H. N., New York.—At the recent meeting of the Harlem Regatta Association, in the gig race a protest was lodged against the gig of the New York Athletic Club. Can you tell me why the objection was made and if it was well founded; also give definitions of gig, barge, and shell? Ans. The objection was made on the ground of the Athletic gig being smooth instead of lap-streaked, and was entirely unfounded. Our understandings of the definitions is as follows: A gig is an open boat with out-riggers; a barge is an open boat rowed on the gunwale; a shell is an out-rigged boat decked forward and aft with a protected cockpit for the rower.

P. G. R., New York.—Do you know of any material better than parchment out of which to make the leaves of fly-books? I have wet the leaves of my book so badly that they are ruined, and I should like to renew them myself, if possible. Ans. We don't know of anything is use, but have been tempted to try oil silk inclosing thin card-board. The objection to parchment is that it becomes misshapen and warped after being wet. Two pieces of oil cloth, such as is used for covering wagon seats, might answer, pasted back to back. There is a recent invention of cork plates glued upon both sides of a linen fabric, but we hear it spoken of adversely.

H. B., Philadelphia.—I have an idea of going into the North Woods, N. Y., for a three or four months trip. Will you oblige me by informing as to what would be necessary for such a trip for two persons, and what the probable expense would be? Ans. So much depends upon the nature of the outfit required, that it is difficult in name cost; boat, guide, and grub, will cost from $3 to $5 per day. Take blankets, both rubber and woollen, and plenty of old clothes. Provisions, such as coffee, tea, pork, etc., can be obtained at the point of going in. See back numbers of FOREST AND STREAM for articles by the dozen describing outfits and experiences in the Adirondacks.

INQUIRER, New Braintree, Mass.—Will you please to answer the following questions in your "Answers to Correspondents?" 1. Do you know of a gunsmith by the name of J. Barnes? 2. Can Kay's concentrating cartridges be used in a muzzle-loading shot gun? 3. Where can I get a map of Virginia, also what would be the price? 4. Is there any law against fishing in natural brooks, if the person whose lands it runs through, puts up a notice: "No fishing allowed here, per order, &c.?" Ans. 1. We have never heard of a gunmaker named Barnes. 2. Kay's concentrating cartridges may be used to advantage in muzzle-loading guns. 3. Address G. W. & C. B. Colton, 172 William street, N. Y. 4. Yes.

E. J. R., Wethersfield.—1. I have an Irish bitch pup six weeks old by Plunkett, which seems to be full of worms and will not eat very well, and when she passes off the worms she passes considerable blood. Her bowels are very loose. Are worms dangerous, and do you know of a harmless remedy? 2. In awarding prizes at bench shows to native setters, is color taken into consideration? If it is, what color stands first? Ans. 1. We have mailed to you the proper doses of powdered areca nut with directions for giving it which will no doubt relieve your pup. Worms frequently prove fatal, when pups afflicted with them are neglected. 2. In awarding prizes to native setters, color is not taken into consideration.

A., Bellaire, Ohio.—1. What is the time, by water, from Quebec to Dalhousie, on the Bay of Chaleurs? 2. What is the character of the fishing for both sea and speckled trout, in the rivers that put into the bay, from the 20th of July to August 1st? 3. Is it entirely free? 4. Can one obtain tent, guides, and supplies at Dalhousie? 5. To whom, in Quebec, can one write for needed information as to steamers and fares, &c., Ans. 1. About 36 hours. 2. Trout large and abundant. 3. No restrictions whatever on trout fishing. 4. Yes, and at Campbelltown, the adjoining town. 5. We have repeatedly solicited no advertisement of the Gulf Port Steamship Company without result, and shall have to refer you to J. U. Gregory, Naval Agent, who will no doubt oblige you.

B. W., Lakeville, Ct.—I have two setters that are alive with fleas. Soft soap, carbolic soap, the ordinary flea tablets, are all counted as nectar fit for gods by these pests. My dogs are all scabs, sores, crossness and ugliness. Can you either tell me of something, or send me something that will rid them of the vermin? Ans. We have had a kennel of setters and pointers for fall forty years and never have failed to rid them of fleas by the use of common soft or hard brown soap. A strong lather of such soap will surely kill all fleas with which it comes fairly in contact. Many persons fail with it because they leave parts of the dog untouched by the soap, and there is where the fleas flee for relief and are saved—and then again, many dogs are kept where myriads of fleas breed and live. The proper way is to lather the dog thoroughly, leaving no place on him untouched, then let him run around for twenty or thirty minutes, after which wash off the soap and place him where there are no fleas. Sprinkle your kennel with wood ashes.

F. M., New York.—Can you tell me the shortest route to Connecticut Lake and give me no idea what it would cost to go there and take canoe with me? Are there any maps published of rivers, giving location of rapids, waterfalls, &c., that would be suitable to a canoeist? What route would you advise for an enjoyable canoe trip? Is it safe to venture through Delaware Water Gap with a canoe? Ans. Leave Grand Trunk Railroad at Island Pond, Vermont, and take the wilderness road to First Lake, Second Lake, and so on; or you can leave the G. T. R. R. at Stratford, stage to Colebrook, wagon to Errol's Falls, boat up river to Duckee's Landing on the Megalloway River, and thence up stream to Parmachene Lake. From thence you can portage over to the Connecticut lakes, and thence go down river. This would make an enjoyable trip. Guides can be obtained at border towns. Don't know what it would cost to take canoe in; it would be a difficult job, but practicable. For map, address N. C. Leach, P. O. Box 77, Montreal. The Delaware Water Gap is passable for canoes.

The American Naturalist for June opens with an article by Dr. James Lewis on "Io and its Habits." Io is an operculate univalve shell abounding in the streams of Tennessee and adjoining States wherever the waters are torrent-like. It is of the family *Strepomatidæ*. A popular explanation (for those who understand botany) of the mathematical nature of phyllotaxis, is printed from a manuscript of the late Chauncey Wright, of Harvard College. Dr. C. C. Abbott contributes a very original account of the traces of "an American autochthon," which he has found in the drift-gravels of Central New Jersey. He considers that the relics described belonged to an aboriginal race, which were exterminated by the first ancestors of the present red man; and if any of their descendants remain until now, they are to be found in the Eskimos. This opinion is supported by parallel evidence in Europe. D. S. Jordan and H. E. Copeland are the writers of an entertaining paper on the little odontostomoid fishes known as "Johnny Darters," which are little known; figures of three genera are given. Prof. W. G. Farlow's description (with plates) of the black-knot fungus which affects fruit trees is very valuable to agriculturist. The two last articles, "Prof. Tyndall on Germs" and "The former Climate of the Polar Regions" are copied from English magazines. Thin departments are well kept up.

The Galaxy for July opens patriotically with a Centennial poem by J. M. Winchell, followed by a description of Washington's Headquarters at New York. Wm. Black's charming story "Madcap Violet," is continued, and in the present installment we are treated to a bit of yachting in the waters of North Britain and some remarkable duck shooting. Mr. Albert Rhodes treats of "Life among the Bedouins," and General Custer transports us to the home of those other wild men, the Sioux of the Yellowstone. Mr. Richard Grant White has "A word with Max Muller" upon the relations of English writing and English speech. Several other papers of merit, and the usual Drift Wood, scientific miscellany, and review of current literature complete the number.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, JUNE 22, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Editor and Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, June 22d.—Trotting: Syracuse and Poughkeepsie, N. Y.; Belmont Park, Philadelphia; Parker City, Pa.; Jackson, Mich. International Regatta New York Harbor. Base Ball: Mutual vs. Chicago, at Chicago; Hartford vs. Louisville, at Louisville; Athletic vs. St. Louis, at St. Louis; Monticello vs. Unknown, at Jersey City; Olympic vs. N. Haven, at Paterson, N. J.; Archer vs. Quickstep, at Philadelphia; Ithaca vs. Olympic, at Paterson; Mutual vs. Tecumseh, at Jackson, Mich.

FRIDAY, June 23d.—Trotting: Belmont Park, Philadelphia; Terre Haute, Ind.; Beacon Park, Boston; Centennial Regatta New York Harbor. Base Ball: Mutual vs. Tecumseh, at Jackson, Mich.; Campbell vs. Centennial, at Philadelphia; Lowell vs. Rhode Island, at Providence, R. I.; Chelsea vs. Arlington, at Brooklyn; Nassau vs. Athletic, at Brooklyn; Chatham vs. Mutual, at Hoboken.

SATURDAY, June 24th.—Racing: Point Breeze Park, Philadelphia. Trotting: Fleetwood Park, N. Y.; West Chester, Pa. Rifle: Geiger Badge Contest, Creedmoor. Regattas: Boston and City Point Clubs, Boston; Quincy (Mass.) Yacht Club. Forest and Stream Club Pigeon Shoot, Scranton, Pa. Base Ball: Mutual vs. Chicago, at Chicago; Hartford vs. Louisville, at Louisville; Athletic vs. St. Louis, at St. Louis; Alaska vs. Resolute, at Jersey City; Alaska vs. Active, at Wapinger's Falls; Orange vs. Nassau, at Orange; Jasper vs. Hudson, at Man. Col. Gr.; Nameless vs. Staten Island, at Brooklyn; Hoboken vs. Produce Exchange, at Hoboken; Lowell vs. Resolute, at Portland, Me.; Quickstep vs. Mutual, at Harlem. Cricket: St. George 2d Eleven vs. St. Paul's School of Concord, N. H., at Hoboken.

MONDAY, June 26th.—Racing: Point Breeze Park, Philadelphia; Trotting: Fleetwood Park, N. Y. Rifle: Sharpshooter's Union Matches at Philadelphia. Regatta to Cape May. Base Ball: Hudson vs. Athletic, at Man. Col. Gr.; Monticello vs. Mutual, at Jersey City. Cricket: St. George's 1st Eleven vs. 1st Eleven of Young Americas of Philadelphia, at Germantown.

TUESDAY, June 27th.—Racing: Point Breeze Park, Philadelphia. Trotting: Watertown, N. Y.; Hartford, Conn.; Stillwater, Minn.; St. Petersburg, Pa. Rifle: Competition at Creedmoor for places on American-Irish Team. South Carolina Regatta, Charleston. Cricket: St. George's 1st Eleven vs. Germantown 1st Eleven, at Germantown.

WEDNESDAY, June 28th.—Racing and Yachting as above. Competition for places on Irish-American Team at Creedmoor. Newark Rowing Association Regatta, Passaic.

SAILING OF THE DORY "CENTENNIAL."—The fishing dory Centennial, with its captain and crew, all comprised in the person of Mr. Johnson, sailed on its adventurous voyage of 3,000 miles, on Thursday last. Whether it will safely reach Liverpool, its destination, remains to be seen. Whether it does or not we cannot see what good is to be gained by the undertaking. In desperate cases of shipwreck long boat voyages have been accomplished, but if Mr. Johnson safely crosses the Atlantic it is not probable that his crossing will materially effect the travel by steamer.

LAWLESSNESS IN THE ADIRONDACKS.

THE St. Germain brothers, who fired into a party of sportsmen on the Upper Saranac with a rifle a fortnight ago, are in jail, and in a disagreeable fix. The charge against them, we believe, is only for assault with intent to kill (and under the law no jury can fail to convict them), but they are also amenable for illegally setting nets and lines. The penalty for the first offence is imprisonment in the penitentiary for a term not less than one year or more than seven; and for the last a penalty of $25, and imprisonment in case of non-payment.

As we stated in a recent issue, the St. Germains fired into Hon. W. A. Wheeler's party under mistake, supposing them to be the Hoyt-Romeyn party, who had cut up their nets, after having first notified them of the illegality of their procedure, and been defied to interfere. The firing was without doubt a willful and deliberate act of lawlessness, with intent to do bodily harm, actuated by motives of revenge; and the judge cannot charge the jury otherwise under the evidence that will be brought. The plea that intent was absent, because the aggressors had no cause of grievance against the party fired into, will probably be put in; but we regard the fact of the wanton and reckless firing into an unsuspecting and unoffending pleasure party, by a rifle ball aimed by a practiced backwoodsman so truly that at a distance of 100 or 200 yards it penetrated the boat within a few inches of the person of one of its occupants—this we regard rather as an aggravation than a palliation of the case. If the lives of innocent parties are to be thus endangered, the North Woods must become deserted or a sufficient police force be organized for their protection, which would of course be impracticable. The arming of each visitor or sportsman in his own defence will not guarantee his personal safety, for he may be cut down by a ball aimed at some other person, or at himself in mistake for some other person. If gentlemen were assured that they had only open enemies to fight, then, with a prospect of being forewarned, they could be reasonably forearmed; but at present one may as well save his weapons and ammunition and trust to the luck and the temper of those whom he encounters. In the case of the St. Germains, they were well informed of the law and its penalties, and defied its execution. They threatened, and they executed their threats; now let them suffer the penalty for their misdeeds.

We sincerely hope that intelligent men, resident or sojourning temporarily in the Adirondacks, will see that this is made a test case in the courts. It is to the interests of the landlords, who have most at stake, that the game and fish is preserved, otherwise there will soon be no attraction for sportsmen; and it is to the interest of all to see that the woods are made safe and tenable to those who enter them unsuspiciously and without apprehension. Let us know whether the setting of nets and lines is illegal or not. We have assumed that it is, as we read the law. If the act *is* legal, then the St. Germains have a right to defend their property by weapons, if necessary, at the time when it is being destroyed. But they have no right to deliberately shoot the trespasser at any time afterwards; for they immediately become amenable to the law for an assault to take life. We shall look for the decision of the court with much interest.

HARD TIMES.—We may still be living in "hard times," but any one who will look at our quotations for fish in the usual column this week must acknowledge that it is many years since delicacies in the fish line were so well within the reach of people of moderate circumstances as they are now. Salmon, fresh from the Restigouche, is selling at eighteen cents per pound. That most delicious of all fish, the Spanish mackerel, although brought from southern waters, is worth but twenty five cents, while heretofore, when caught in our immediate vicinity, they have brought from thirty to fifty cents. Green turtle sell for but twelve and a half cents per pound, when a careful examination of our files for years back will not show them to have sold for less than eighteen cents, and seldom at less than twenty-five. Indications show that throughout the season we are likely to have an unusual abundance of both fish and game, of all varieties.

—A game protection society is about being formed at Newport, R. I., some of the most prominent citizens as well as summer visitors having interested themselves in the matter. The game already on the island is to be carefully preserved and added to by restocking. The organization will also include a rifle club, and a range is to be established at Portsmouth Grove, a few miles from this city, where a 1,000 yards stretch upon a dead level can be secured at a trifling expense, permission having been given by its owner for that purpose. The targets are all to face the south, and on the right of the shooting point a high hill rises, which will be a most favorable place from which to watch the signals and shots.

MORE SOLID EVIDENCE.—Mr. Gilbert Longfellow, of Roque Island, near Machias, Maine, complains in a letter, printed in our Natural History department, that a casual reference to himself has brought him so many applicants for eggs that they are a nuisance, or words that might imply as much. He refers to this fact (and so do we) as evidence of the advantage of advertising in our columns.

—This Centennial year every inducement is being held out for people to travel. The Erie and New York Central are fighting over which will carry the passenger traffic. The fare to Niagara and Buffalo is $5, to Utica $4, to Chicago $13, and a proportionate rate to all points.

FOREST PARK ASSOCIATIONS AND PROPRIETARY CLUBS.

THERE are quite a large number of shooting, fishing, and game protection clubs throughout the United States and Canada—most of them incorporated—that own considerable tracts of real estate, with buildings for the accommodation of members and guests, and all appurtenances for their pleasure and convenience, and the objects generally for which they were formed. Among the oldest of these clubs are the fishing clubs at West Island, Pasque Island, and Cuttyhunk, off the Massachusetts coast, the South Side club of Long Island, the Oquossoc fishing club of Rangeley Lakes, Maine, the Long Point shooting club on Lake Erie, the Currituck shooting club of North Carolina, and the Qua Qua shooting and fishing club of Wisconsin. All of these own considerable tracts of real estate, and valuable buildings. There are very many more that have been established on a similar basis within three years past; indeed, it is chiefly within three years that the innumerable sporting clubs in nearly every State, of whatever character or scope, have been formed. Nearly all of them have the protection of game as a professed object, though they do not make the propagation of game and the culture of fish a business or a study, their main object being a systematic prosecution of sport with rod and gun under the laws defining the close and open seasons.

The Long Point club, if we are not mistaken, was the first chartered organization that purchased a large tract of country with the avowed object to protect it and the game in it. Its success was so great that, despite the opposition of ancient squatters on their territory, and persistent depredations by outsiders, they found the game to have increased marvelously within three or four years, while the opposition of market hunters had proportionally decreased. This success was observed, and the example stimulated other organizations.

For centuries the ownership of large forest lands for hunting purposes was a royal prerogative throughout all Europe, and until a very recent date, even within the contracted area of England, tracts of 20,000 acres or more, like the Black Forest and New Forest, were appropriated for the sport of the grandees, and jealously guarded by foresters and game keepers. We, in America, who claimed the "whole unbounded continent" as ours, had no need for reservations like these in the early days. The wilderness was around us, and the game was free. But with the encroachment of population forests were felled, game became scarce, freebolders prevented trespass on their lands, and good hunting grounds became isolated and comparatively few. For awhile the lords of the manor could enjoy the privileges of royalty in democratic America on their seignorial domains, but these large tracts soon became too valuable for individuals to hold, and they were cut up into parcels. For individuals to reserve large areas exclusively for hunting purposes was totally out of the question; but astute sportsmen, who saw the game retreating rapidly, and perceived that they must soon travel immeasurable distances to find any at all, began to consider expedients. The initial result was the establishment, in 1871, of the Blooming Grove Park Association, in Pike county, Pennsylvania, the editor of this paper being one of the incorporators. This association now owns and leases about 12,000 acres of forest land, which is an extent that compares favorably with the largest in Europe. It was found that a combination could assume obligations which the wealthiest individual could hardly do, and the results of five years appear in the gratifying annual exhibits of the Secretary of the association. The Park has become an attractive place of resort for sportsmen and their families from May to December; deer are very numerous, being not only protected, but propagated; the club house is the largest and best in America, and the primary objects of its projectors are in a fair way to be carried out to eminent success.

That the preservation and reservation of suitable forest tracts for the public benefit has received the serious attention of our leading statesmen is evinced by the setting aside of the Yellowstone region by Congress as a National Park, and the attempt to reserve the Yosemite and the Adirondacks. Quite recently two forest park associations have been chartered—one embracing the Fulton chain of lakes in New York State, and the other certain districts near San Francisco, California. We have referred to both of these within a month, and some additional information respecting the California enterprise will be found in the following letter. Both of these tracts, we should state, include many thousand acres:—

SAN FRANCISCO, June 4th, 1876.

EDITOR FOREST AND STREAM:—

A week or two ago I sent you some account of my operations in angling in Lake Merced, some few miles nearer our city than either lakes San Andreas or Pilaritos (of the latter of which, when I visit it, I will also write you some description), and which are the principal pieces of water now leased by our new sportsman's club here. I will now relate my piscatorial experience in San Andreas. This fine fresh water lake comprises an area of one thousand acres. It is surrounded by hills, and a few that may be termed mountains, partly clad in trees and shrubbery, and partly in pasturage. The scene from our club house about the middle of the lake is very rarely interesting and picturesque, a succession of fine headlands and small bays presenting themselves to the eye in looking either up or down it. The manner of fishing there, this early in the season at any rate, for sometimes there is fair angling, is by trolling from a boat a small spoon. The fish to be taken are a small species of silver salmon, or salmon trout, the general average of their weight this year being one pound and a half. Different from Lake Merced, this lake is naturally well supplied with small chubs, furnishing a good amount and description of food for their larger brethren. Also, the woods and brush on the west side furnish the salmon with abundance of insect provender. This lake is also about three or four feet higher than it was last season. It is likewise more exposed to the strong west trade gales from the ocean, which blow almost daily in this region in the months of

April to September, from eleven A. M. to seven or eight P. M. These winds interfere much with the fishing. The first day I was there, lately, I had only about an hour's trolling, during which time I caught but one fish, a pound in weight, which took the spoon. I had two artificial flies upon my line above the spoon, nearly black, because that is the color of the natural flies and wild bees which fall into the water quite plentifully. It then came on to blow "great guns" from the western shore, near which I was, and which rendered the contemplation of landing my boat on the eastern side to the club house, through the breakers, not particularly pleasant. At last, after waiting some time, I made up my mind to cross. Fortunately the rather flat spot which I intended for a landing, and which I could dimly discern, was nearly opposite, and I had only to keep the boat before the gale. This I succeeded in doing, being an experienced boatman, and rowing across almost like a flash I drove right ashore and jumped out in a moment to take hold of the boat before the waves could take her broadside on and so swamp her. I accomplished this, however, with only a slight wetting to myself and creel, which contained my tackle, fly books, &c. Toward evening the storm abated, and the next morning the sun rose clear of fog clouds, and the weather was perfectly calm and beautiful. I was in the lake before his solar majesty had made his appearance above the horizon. The superintendent was there also in a separate skiff. In crossing the lake I hooked a good fish, a salmon of two pounds, and after a sharp contest got him safely into my landing net. He took the black fly. Then the water remained too smooth, and almost without a ripple for four hours, with a warm sun. I and the overseer trolled faithfully for nearly all that time, and could not get even a touch of a fish at either spoon or fly. We saw only about half a dozen rises, but observed quantities of chub close to the shores, much disturbed and jumping out of the water, and the salmon no doubt savagely feeding on them. The overseer did not get a fish, and he soon retired from the field of action. I kept on for some time after this, but met with no better success than before. Then I gave up the fight under the conviction (consolatory to my skill as a fisherman, of course) that these gentlemen fish were pampered gourmands, and by far too well fed to take the epicurean and delicious (?) fare we had so carefully provided for their generally voracious, though, as in this case, from satiety, rather delicate appetites for any artificial temptations offered to them. In about a month, when the water falls, from its vast consumption in the city and evaporation, and the chubs and insects become scarcer, there will probably be some good fishing. In the meantime we sportsmen must make ourselves contented with what lakes Merced and Pilarcitos and other waters can afford us, and in general, like all true sportsmen, take the good the gods provide us. E. J. HOOPER.

There are several tracts in the United States, which still remain in nearly their primitive state, which ought to be assigned to the purposes of parks, namely: one in the Blackwater region of Virginia, another in Northern Michigan, one in Southwestern Texas, and another in Florida. The latter comprises about 3,500 acres, of which 1,200 is cleared land, lying within ten miles of the city of Tallahassee, the Eden of Florida, diversified by lake and river, and abounding in game and fish. This property belongs to Mrs. Ellen C. Long, daughter of Gen. R. K. Cale, the first Governor of Florida, and is for sale It lies partly on Lake Jackson, and includes within its boundary a lake four or five miles in circumference, besides the River Oclockonee running through it, and affords a variety of fish, wild fowl, snipe, deer, turtles, quail, &c. It is not like the Florida jungles, but has fine drives running through it, and fields that have been cotton plantations, and buildings that may be utilized by any club or association. It is a high and rolling country, and has been always famous as a hunting ground. It is known as Orchard Pond now, but was called Lochiocha by the Spaniards and Indians—a much more euphonious name. Should any gentleman entertain the idea of purchasing this most desirable tract a letter may be addressed to Mrs. Ellen C. Long, Women's Department, Centennial Exhibition, Philadelphia, or additional information may be obtained from the editor of FOREST AND STREAM.

The following letter, describing one of our prominent clubs on Long Island, is pertinent to the subject of this article, and will be read with general interest:—

EDITOR FOREST AND STREAM:—On Tuesday last, by the kind invitation of Mr. S., we left in the 9 A. M. train on the Long Island Railroad to pass a few days at the famous Suffolk Club. Our party, consisting of three, arrived at the club house at mid-day, and after partaking of a no excellent lunch and arranging our tackle, we started for the pond, Mr. S. and I going in one boat. The day being fine, and a light breeze blowing from the southeast, we were confident of a good afternoon's sport. We made a good beginning, for the boat had only just left the shore when a large fish rose to my fly. I missed him, and after three or four more casts he rose again, this time I struck him, and after a few minutes' play landed a fine one-pound trout, and scored the first fish of the party. Mr. S. soon followed my lead, and before the afternoon had half gone had gained some two or three fish ahead of me. Our sport was good, but at sundown we expected to do wonders. Our hopes were not to be fulfilled, for at 5 o'clock, or a little later, the wind began to die out, and by 6 o'clock the pond was as smooth as a looking-glass. So we took ourselves home—tired, hungry, and well satisfied with our afternoon's work. Our small fish we returned to the pond, reserving only those weighing one-half pound and upwards.

Mr. S. had impressed upon us that at the Suffolk Club every one had to make up his mind to rough it, so imagine our surprise at having a dinner placed before us that would have done honor to Delmonico. The history of the club is this:—

Many years ago fifteen gentlemen in New York formed themselves into an association, bought some eight hundred acres of land, hired the fishing in the pond, and built the present club house. They have since bought the pond, which covers some forty acres, and secured the fishing in the stream which feeds it, for two miles up, which, by the by, is an excellent spawning ground, the bottom being covered with beautiful gravel. They have also hired the exclusive right to shoot over twelve hundred acres adjacent to their own property, giving them in all some two thousand acres of as fine shooting as there is to be found anywhere on Long Island. English snipe may be found on the meadows in the spring, and in the summer and fall woodcock, quail, and ruffed grouse abound. The club house is a large wooden building, two stories high, with a large dining room, library, and some twelve bedrooms, and as all the members are never present at once, there is always ample accommodation for all. In the latter part of the summer and fall some of the gentlemen bring their families down with them. The ladies may occupy the morning in boating, or croquet, or take a book and spend their time reading by the cascade, a truly lovely and romantic spot, or in a boat row up the stream. In the afternoon the driving and riding will keep them busy until dinner time, when the weary sportsman returns from his day's tramp. The stables and kennels connected with the club are the best of their kind and afford accommodation for any number of horses or dogs. Mr. S. told me that for three years he put out a dozen pairs of the pinnated grouse, or prairie chicken, but hearing nothing of them, after numerous inquiries made through the country, came to the conclusion that they were all dead, and last year gave up the experiment of propagating them. But the head game keeper on our arrival this trip, reports that two pairs, quite tame, had been seen near the club house, and another pair across the pond. This was, of course, exceedingly gratifying, for if they are not disturbed they must in time multiply, and all that section of the country will be as plentiful in prairie chickens as it now is in quail, and the Long Island pinnated grouse will cease to be a thing of the past. The morning before I left the club I rose early, wakened by the calling of the quail and bright rays of the sun pouring in my room, and taking "Jim," (a black pointer, fall brother to Mr. S.'s "Tom," winner of first prize at Springfield this year) and started for a morning tramp in the woods, both to see the working of the dog and how much game there was. I found everything as it had been represented to me, the dog worked handsomely, and we found more game than I ever saw in a day's tramp anywhere. Old "Jim," though twelve years old, still deserves the appelation given him some years ago by some of the members, namely, "Locomotive," for he certainly is the fastest dog I ever shot over, and perfectly true and staunch, it being quite impossible to call him off his point. One of the anecdotes they are fond of telling relates how he came to a point two hundred yards off. When Mr. S. came up with him he commenced calling the party: it was nearly twenty minutes before they came together, they then began to walk in, and first one, then another, and still another bird got up, they were all killed but one; still Jim held his point, and did so until his bird rose, which Mr. S. killed. After breakfast we returned to the pond, and cast until noon. The sport, however, was not as good as the previous day. While on the pond a number of quail flew back and forth across the pond, and the woods re-echoed with "Bob Whites." There are a pair of wild geese on the pond, which are very serviceable as decoys in the spring and fall, and I had almost omitted to relate how one of our party seeing them in the morning hurried back to the house for gun and ammunition, mistaking them for veritable wild fowl. It was consoling to him, however, when he became aware that he was not the first visitor who had been thus deceived by these same geese. At 3 o'clock Mr. Wm. Osborn was in waiting to convey us to Yaphank, where we took the cars for Hunter's Point, and thus ended one of the pleasantest trips I ever made.

GROUSE.

NEW YORK, May 20th, 1876.

OUR CENTENNIAL LETTERS—NO. 3.

SHOT GUNS AT THE GREAT EXHIBITION.

As the demand for fine arms of every description increases rapidly in this country, and carries with it a growing competition, manufacturers necessarily make most strenuous endeavors to produce novelties and improvements, each of which shall be an advance upon the last. As might naturally be supposed the Centennial Exhibition affords an opportunity for the display of all that is new of this description which has been taken advantage of to the utmost, particularly by foreign manufacturers. In fact it is somewhat surprising to see the display of guns in the English exhibit so much larger than that in our home department. English makers have an incentive in making a good show from the fact of one of their best markets being on this side of the Atlantic, and their various exhibits are so arranged, *en suite*, as to make a remarkably handsome display. But we have enough manufacturers in this country to have made an equally creditable exhibit had any combination been formed to have so arranged it. As it is, with the exception of what may be found in the Government Building, and exhibited under the auspices of the Smithsonian Institution, our leading manufacturers, with one or two exceptions, have contented themselves with showing a few shot guns in connection with their more elaborate collections of rifles; and it may be mentioned here, that if the English exhibit of shot guns is superior in point of numbers as well as quality, our display of rifles far exceeds anything of the kind of foreign manufacture in the exhibition.

There is so much to be seen and described even in this one department alone, that it is impossible in a single letter to convey anything like an adequate idea of the Exhibition; it is our purpose, therefore, in the present article to confine ourselves to shot guns, and that, too, mainly with those shown by our foreign visitors. A single day, and that a first one, is indeed, almost insufficient to properly examine this department. Almost half a day is necessary for one to obtain his "bearings" and gain an insight into the general plan which will afterwards enable him to steer a course for any given point without the aid of a pilot. Even in the English department alone one becomes almost confused with the dazzling display of all that is rich and rare in British manufactures. But the sportsman is guided almost instinctively to the guns, and once found it is nearly impossible to leave them.

The largest display is that of Messrs W. & C. Scott & Son, of Birmingham and London, which is in charge of Mr. Romney, of Messrs. Read & Son's, of Boston, during the absence of Mr. W. M. Scott, who is spending the summer in this country. The "Scott" guns are now so widely known throughout the United States that it is only necessary to allude to some of their more recent improvements in the actions and mode of boring. The latest of these is the triplex lever grip, which, in addition to a solid double bolt at bottom, has a strong hooked cone attached solid to the head of the lever which enters into a steel projection in the rib. The advantage of this action is that it effectually holds the barrels to the breech and enables the heaviest charges to be used in duck or match shooting. Another new fastening is the quadruple bolt, which in addition to the solid double bolt at bottom, has also two top fastenings, two steel socket projections being left on the sides of the barrels into which two bolts at the breech, worked by the lever, fit when the gun is closed. Some of the guns have in addition an extended rib dovetailing into the breech. These are but two of the various actions exhibited. In quality, the guns rank from the "premier" at, say $300 to the 4th quality at $100. A very neat and inexpensive gun made by this firm is the "Special Field" gun, with top-lever, solid double bolt and rebounding locks, sold at $100. Another improvement of Messrs. Scott which is placed on all guns when so ordered, is an improved "high dead-level rib," with which it is claimed that the shooter can take a surer and quicker aim. This case contains also a number of highly finished gilt engraved guns and revolvers, such as were taken to India by the Prince of Whales for presents to Indian rajahs, etc. Also sections of barrels showing their modes of choke-boring and actions.

Adjoining this exhibit is that of Messrs. J. & W. Tolley, whose guns are also widely and well known in this country. Messrs. Tolley have adopted the plan of giving their guns distinctive brands with uniform prices for each, ranging from the "Pioneer" at $65. (gold) to the "Paragon" at $225. The workmanship of these guns is excellent, and shows great care. One of the novelties shown us by Mr. Tolley, who is present in person to give information, is a new action in which in addition to the double bolt there is an extended lump in which the bite is taken back of the face of the false breech, giving great strength. We had an opportunity of examining and comparing guns made for English sportsmen and for our own. It is rather remarkable the difference which exists in the drop of the stock. Guns ordered from America usually having from one to two inches more drop than those used in England, where much straighter stocks are in vogue. We noticed recently, however, at Geneseo, that some of our crack pigeon shots were using straighter guns. Mr. Van Vleck, of Buffalo, who won several prizes, shot with a Greener gun with only one inch and a half drop; and by the bye, our representative shot in the press match with the same gun and found the difference between an inch and a half and three inches disastrous to his chances. The position taken by the majority of pigeon shooters, leaning far forward, may necessitate a straighter stock to enable them to avoid shooting under their birds.

Mr. John Rigby, of Dublin, the well known rifleman, whom we trust soon to welcome to our shores once more, has a case containing both shot guns and rifles, which do him credit. Mr. Rigby, on the occasion of his last visit to this country, brought over a couple of guns which were so much admired that he was induced to leave them here. Of those under review we were particularly pleased with a very handsome gun fitted with Rigby's patent snap-lever easily removable, simple and strong. The price was $320. Mr. Rigby also exhibits some elegant double Express rifles, ranging in price as high as $440, gold.

Messrs. P. Webley & Son have a remarkable handsome case of guns in which every variety can be found, from the highly finished and more elaborate gun to the cheapest. Messrs. Webley have guns as low as $50. Good serviceable pieces they appeared to be, and one at $91 a 10-gauge, with top action and rebounding locks, appeared to be a particularly fine gun. We were shown some self-cockers, an improvement, we believe on Mr. Lang's patent, in which the movement of the lever under the guard throws the hammers to full cock, a very good arrangement for Captain Bogardus in his matches against time or for duck shooting in very cold weather, when one's finger become numbed, but for ordinary shooting we should prefer rebounding locks. Some of the guns were fitted with the Webley-Lancaster lock-fast, in which the forepart, or as it is sometimes called in this country, the false stock, is attached to the action. The Webley guns, although not so widely distributed in this country as those of other makers, are likely to become much better known through the medium of the very handsome exhibit which is now to be seen in Philadelphia.

Mr. W. W. Greener exhibits a handsome case of guns, not numerically large but of remarkably fine workmanship. Some of them are most elaborate in finish but as there was no one in charge of the case we had no opportunity of examining them. Mr. Greener's guns, however, are too well known to require special comment. His choke-bores are now used by many crack pigeon shots, particularly in the Southwest. One of the most striking objects in Mr. Greener's exhibits is the elegant *Field* cup won by him in the great gun trial of 1875, a reproduction of which also ornaments the stocks of some of the fine guns.

A very popular maker in this country is Mr. Edwinson C. Green, of Cheltenham, England, who also exhibits a case of guns, not made especially for exhibition but taken from the stock of Mr. Green's American agents, Messrs. Russell & Haydon, of Jacksonville, Illinois, or made to order for sportsmen in this country. Mr. Green has made choke-bore, or extra close shooting guns for the past nine years, and claims to be the first to use the system. He makes a gun at as low as $45, currency, for No. 12-gauge, with a double grip action and the left barrel bored to shoot close, and from that at all prices up to $250 for the "Excelsior."

We were unexpectedly gratified in meeting Mr. Purdy, son of the well known London maker of the same name. Mr. Purdy is in charge of a choice assortment of fine guns from his factory, comprising both Express rifles and shot guns. The workmanship of these guns is remarkably fine and although the prices are high there is full value given for the money. The warrant of "Gunmaker by appointment to H. R. H. the Prince of Wales," which ornaments the case is in itself a good guarantee of quality. Mr. Purdy showed us some guns, such as are used by many of the best amateur pigeon shots in England, among them Mr. Howard S. Jaffray, of this city, who has been most successful in his matches. We were surprised at the lightness of the guns—seven pounds being about the average. Mr. Purdy now uses the top action on most of his guns, others of his make which we had seen in this country having had the lever under guard action.

Mr. Geo. Gibbs, of Bristol, exhibits a case of fine guns and rifles, among the latter of which we noticed a heavy rifle entered for 2,000 yards, some with telescope sights, etc. We hope to make a closer examination of it on our next visit.

Mr. J. D. Dougall, of London, exhibits a fine collection of his new lock-fast guns, the peculiarity of which is that

the barrels are forced forward an eighth of an inch by the pin on which the barrels hinge being an eccentric. The lever is on the side, and if we mistake not, the guns have a solid fore end, the whole giving great strength. Mr. Dougall's guns looked remarkably handsome, but we had no opportunity of handling them. Alex. Henry, of Edinburgh, is an exhibitor of some very fine rifles and shot guns, also of some lance guns for seal and walrus shooting. Messrs. E. M. Reily & Co. and C. Lancaster, of London, both exhibit cases of handsome guns.

In fact this department of the Great Exhibition is fairly fascinating to the sportsman, and with all there is to be seen in the way of novelties and guns of exquisite workmanship, alone well worthy of a visit. One, however, is by no means sufficient, and our description of American guns and rifles and, possibly, those of some English makers omitted, must be left for another letter. There is nothing in the way of improvements in gun making that is of more convenience to the sportsman than the snap fore piece now attached to fine guns by all makers. With it the gun is taken apart most readily, and the old pin which sometimes requires so much patience and the use of a screw driver before the barrels could be removed from the stock, is entirely done away with. There are other novelties still undescribed to be noted in our next.

OUR CENTENNIAL LETTERS—NO. 4.

THE DRESS AND HOME-LIFE OF THE INDIANS.

THE immense resources of the National Museum (Smithsonian) have been drawn upon to furnish a proper representation of the social life and arts of the American Indians. Something over fifty wire aborigines—mostly without heads, and hence scalpless—stand in orderly array in a dozen glass cases in the Government Building, wearing the costumes of various tribes from Greenland to Mexico. Except the Eskimos, all the tribes represented are from west of the Missouri, for not much remains but stone implements, of Eastern nations, so long is it since they disappeared or assumed the habits of civilization. The effort has been to make it a typical display of Indian art, and the costumes are all deftly wrought of skins. There is a general resemblance throughout, and a description of one will serve for many. Take the wax figure of Red Cloud, for instance, which stands stiff and straight with its back to a post as though its prototype were about to be burnt. The face is a good likeness of a Sioux, broad, at and sleepy, but without an atom of kindness in the small, brown, watery eyes. Supposing this were Red Cloud, Chief of the Ogallala Sioux, standing *in propria persona*, you would observe that he wore upon his head a skull cap of buck-skin supporting two thin horns, made by whittling down buffalo horns, which stand straight up and have tassels of red hair on their tips. The cap is trimmed with tufts of white hare's fur and lines of black and white beads; it ends behind in a bunch of eagle quills. His hair is combed into one lock at each side which hangs nearly to his waist, and is bound with a black ribbon (sometimes with a strip of fine mink's fur, or something of the sort). The eyebrows are partially plucked out, and the face is scrupulously clean of beard and ordinarily not painted. Around his neck is a necklace of grizzly's claws—trophies of the chase, and from a brass ring through each of his ears hang thirty *Dentalium* shells strung in five rows with a piece of *Haliotis* at the end. Over his broad shoulders is a shirt of buck-skin which doesn't in the least fit him, and has very tight sleeves, below which it is not sewn together at the sides. At the lower edges of the garment the skin of a leg of the buck hangs down almost to the ground, and is fringed at the edges. For want of a real medal, one of yellow, red and green beads is embroidered on his breast. Little rosettes of flattened porcupine quills also ornament his shirt front, and, besides an epaulet-band, bands of bead-work three inches wide extend more than half way down both the front and back of the shirt, meeting on the shoulder. This band is patterned in beads of several colors, and from its outer edge depends a fringe of scalp-hair, any deficiency in space being supplied by mink-fur or horse-hair—black, white, yellow, and green—which he replaces by human locks when he is fortunate enough to secure a scalp. The chief's thin but tough legs are encased in tight leggins flaring out over the instep into long fringed ends which flap about his feet as he walks. The breeches have no seat in them, but are held up by a thong tied to the belt on the outside. They are usually ornamented by lines printed on the buck-skin, or by bead-work, and sometimes have elaborate fringes on the outside seams. His moccasins are plain, tight-fitting, and their shape is a distinguishing mark of the tribe.

Such is the ordinary dress of the Sioux warrior. Sometimes, however, it is much more elaborate in its ornamentation, an immense amount of work being put upon it. I have seen suits among the Utes that could not be bought for less than $100 in gold. They were really very handsome, and the braves and maidens who wore them appreciated this fully, and were careful of them.

In general the women do not dress as well as the men, because they are not allowed the time or material for it; nor do they seem so vain as most of the young braves. Their usual dress among the tribes between the Missouri and the Great Colorado is a sort of loose, sleeveless tunic of buck-skin, or, nowadays, brown cloth, belted about the waist with a broad belt so disposed as to sustain the abdomen. On gala days they have more or less finery, and the daughters of a wealthy chief often present a very fine appearance. Some of the women's garments show will excite the envy of their fair sisters who have a taste for the picturesque. None of the clothing is so delicate in and workmanship, however, as the council robes of the chiefs, which trail upon the ground, and are ornamented in the highest style of Indian art. When he wears this the councillor also dons a crown of eagle feathers, from which a double row of feathers hangs down to his heels. He feels his official position at such times, and comports himself with so much dignity as to offset a large amount of the squalor and brutality of his ordinary life.

Among the curiosities of dress, the woven garments from Alaska are worthy of the most attention. They are in the form of sacks with long sleeves and hoods, and present the same appearance either side out, looking like a continuous garment of fur. But in handling them you discover that they are woven of strips of skin—hare's usually—with the fur on, and a wrap of strings of buck-skin, or strips of cloth. They are very closely woven, and make an exceedingly warm and handsome garment. Several are shown. From these northern regions where the necessity of keeping warm has urged to great ingenuity in securing the result, come cloaks, also hooded, made of the breasts of loons, or of gulls and grebes sewn together. A surprisingly beautiful cloak results. Sometimes they are lined with down or hare's fur. About 150 skins are required for one sack. The downy skins of young waterbirds are cut into strips and woven into blankets which are much more flexible than even a heavy woolen blanket would be. The celebrated water-proof suits of the Aleutian Islands are also here. These are made from a large intestine of the sea-lion which furnishes a strip of semi-transparent gut about eight inches in diameter and several feet long. These strips are sewn together round and round until a coat is made; the hood has a puckering-string which draws it close around the neck and face; the wrists are tight. The wearer seats himself in his kyak, which is a hide canoe having a hole in the deck only large enough for a single man to tuck himself into, and fastens the skirts of his water proof coat to the rim of the round hole in the deck. No water can then get in, even if he he rolls over and over in the water, as these daring canoemen are said often to do.

Two years ago Prof. F. W. Putnam found in the caverns of Kentucky, among other human remains, some well-preserved moccasins or sandals "neatly made of finely braided and twisted leaves of rushes," and cloth woven of the same material. These sandals seemed to be unique; there was no record of any such articles existing among any people that could be found except that the peasants of Spain used to make shoes out of a certain grass abundant there. There is, however, in one of the cases here a sort of half-boot made of bark by the natives of Alaska, who seem to have worn it as a stocking inside their seal-skin boots; and sandals of agave fibre which Dr. Edward Palmer procured among the Diegueños Indians of Southern California that closely resemble those found in the Kentucky caves. Hats of grass are also shown, and mats and cords of "babiche" from the McKenzie River—babiche being a kind of bempen fibre. The finest specimens of such work, however, are the conical baskets from Southern Arizona, some of which are woven so closely as to hold water. They are made by the Pimas and Papagos chiefly, who excel in this work, even constructing boats of basket work which do not require pitching. These Southern people make the best of woolen cloth also, and some splendid Navajo blankets in bright colors are exhibited. These blankets were formerly woven on their own rude looms, but the Government has now given many of them better looms, facilitating the work. Still a really fine blanket is worth about $75. The Pimas of the Gila Valley weave a coarse cotton cloth also, upon a loom which they roll up like a bundle of sticks, and hold firmly between the toes while operating.

Space forbids further description of this interesting department which those in charge have so well and fully illustrated. Several cases are devoted to the pottery and culinary apparatus of the Indians, in clay, wood, and stone. Other cases contain implements of the chase, particularly a fine lot of bows and arrows, the latter with stone points; tools for the preparation of skins, etc.; and horse trappings, braided whips, lariats, etc. There is also a model of a sweat-house, and photographs of the lodges and villages of various tribes. One case contains a large variety of wampum and other shell money, among which are the *Dentalium* shells which pass as currency among the Northwestern tribes. Of any one of these objects very much of interest might be written. Take the single item of snow spectacles, for instance, designed by the hyperborean to keep off the ever-present glare which would soon produce blindness. Some of these spectacles are merely thin pieces of cedar fitted to the nose and eyebrows, and tied round the head, having a very narrow slit to peek through. But there are half a dozen modifications and improvements intended to reduce the reflection of the snow, and increase the comfort of the wearer. Finally there everywhere appears evidences of the decorative art of the redmen, that of the Mexicans attracting attention for its superiority, and its symbolic character, while the huge carved doorposts of the Alaskans, two specimens of which are present, and which recently have been figured in an illustrated newspaper in this city, are the most conspicuous objects in the vicinity.

—We acknowledge the receipt of an invitation to attend the opening reception of the Racquet Court Club at their new club-house, Sixth avenue and Twenty-sixth street, which, unfortunately falling on our busiest day, we were unable to enjoy. The opening of the new club-house, which is devoted largely to the healthful and stimulating game of racquets, may be said to almost mark the introduction of the game to the young men of this country. That it will rapidly become popular is beyond doubt The officers of the new club are as follows:—

William R. Travers, President; Rutherford Stuyvesant, Vice-President; W. Watts Sherman, Treasurer; M. Morgan, Secretary. Governing Committee—William R. Travers, Rutherford Stuyvesant, Edward La Montague, A. Wright Sanford, Charles G. Frauckyn, Henry L. Burnett, John A. Lowery, William Watts Sherman, Mathew Morgan, George S. Bowdoin, Roland Redmond, Isaac Bell, Jr., Edward G. Field, Frederic Bronson, Henry C. Babcock, James V. Parker, Charles E. Strong, William P. Douglass, George P. Wetmore, Louis L. Lorillard, James Curphey, Cornelius Fellows, David Lydig, and Thomas R. Fisher. Racquet Court Committee—E. La Montague, R. Stuyvesant, David Lydig, H. C. Babcock, and E. G. Field. Gymnasium Committee—Frederick Bronson, Isaac Bell, Jr., Roland Redmond, and A. W. Sandford. House Committee—Henry L. Burnett, W. W. Sherman, J. Curphey, C. E. Strong, and M. Morgan.

LADY SALMON ANGLERS.—Gentlemen need not hope to bear off alone all the honorable trophies to be won in the angler's profession. We have taken repeated satisfaction in calling their attention to illustrious examples of ladies' skill in handling a salmon, notably the lady Dufferin, wife of his Excellency, the Governor General of Canada, who is a peeress in her own right to the title of leading female expert of America. Nevertheless, it is gratifying to know that this rare acquisition, with its enviable honors, is not confined to the New Dominion. We mentioned, a while ago, a niece of Daniel Webster, now residing in Washington, who inherits her father's dexterity in the use of the fly-rod, and there are several ladies of our acquaintance who would possibly not blush to be mentioned in the same category, did we feel at liberty to mention their names. However, there is our talented correspondent, Miss Sara J. McBride, of Mumford, N. Y., who is already known, not only as a dexterous fly-tier of enviable reputation, but a lady who studies angling as a science as well as a pastime. And there is a little lady living in San Francisco, Cal., who shall be nameless in deference to her sensitive modesty—a princess of the blood, with lineage direct from a long line of ancestors who have been anglers, inheriting the divine gift herself. Her father is known to the public under the pseudonym of "Podgers," the gentleman who first presented Mark Twain and Bret Harte to the coterie of *literateurs* and to the public; but the cabalistic word Podgers is rather a password to the hearts of intimate friends, than a clue to recognition by most readers of the present generation. Of this young wood-nymph, her father says. "The last time we were out, she landed 35 salmon in one morning's fishing that weighed 700 pounds in the aggregate! How is that for a girl of 18 years?" The echo is the response. And now this brave lady and her father have already undertaken a summer angling tour, extending from California to Maine! First they went to the headwaters of the McCloud and Sacramento rivers, where the trout run from 3 to 6 lbs., and the salmon from 10 to 30 lbs. in weight. We shall hear of their success betimes. Next will follow a few days' trout fishing at Ogden, Utah, and in Weber River, Bear River, and other streams on their way to the east. Their objective point is the Wilderness of Maine, where the quality of the fish will be tested, and compared with those of the Pacific Slope. What a creditable performance this will be! How it will stimulate some men, and eclipse the boasted exploits of others! And why should not our women share with us these exobling and health-giving pleasures, thereby qualifying themselves to assist the work of restoring the physical standard which belonged to the generation of their grandmothers but is lost in the present?

The Rifle.

—Owing to unavoidable causes the printing of the FOREST AND STREAM Hand-book for riflemen has been delayed far beyond the time intended. It is now in press, however, and will be issued the latter part of this week without fail. Orders can be addressed to the publishers, Messrs. J. B. Ford & Co., or to this office.

—The Indians are improving by long range practice, having recently wounded two soldiers of Gen. Crook's command at Prairie Dog Creek at a distance of 600 yards.

THE INTERNATIONAL MATCHES.—The final competition for places on the Centennial team was shot last week, and the twelve men who are to form the team and reserve were selected in the order of their scores, being the highest aggregate in the second and third competitions, as follows:—

	2d Compet'n.	3d Compet'n.	Total.
W. B. Farwell	429	255	684
F. Hyde	431	429	860
L. Weber	414	430	843
T. S. Dakin	402	443	835
G. W. Yale	423	404	827
L. C. Bruce	391	420	811
J. A. Shaffer	388	420	808
H. Fulton	377	429	806
C. E. Overbaugh	382	420	802
A. Anderson	393	404	797
H. S. Jewell	391	402	793
N. Washburn	383	381	764

Messrs. Dakin, Yale, Bruce, and Fulton were members of last year's team. Of the new men the *Times* says:—

"Col. Willard B. Farwell, the foremost man in the team, is a native of Massachusetts, and forty-three years of age. He was for many years managing editor of the *Alta California* in San Francisco, but is at present engaged in the manufacture of machine guns.

"Mr. Frank Hyde is an agent for Remington's sewing-machines, and a resident of Ilion, N. Y.

"Mr. L. Weber was born in Buffalo, and has been a sea-faring man the greater part of his life, but is now connected with an insurance company.

"Col. J. A. Shaffer is a resident of Chicago, and manager of a Health Lift Company. He is thirty-six years of age, and served as Lieutenant Colonel with the Second Battalion Illinois Volunteers during the war, receiving a commission as Brevet Colonel at its close.

"Mr. Charles E. Overbaugh is connected with Sharp's Rifle Company, and is a native of Greene county, in this State.

"Lieut. Andrew Anderson is a resident of West Hoboken, N. J., where he is interested in the real estate business. He has just received his discharge from the Fourth Regiment New Jersey National Guard, his term of service having expired.

"Mr. Nathan Washburn was born in Hartford, Conn., where he continues to reside, and is engaged in the manufacture of car wheels. He is about forty-five years of age.

"Major Herbert S. Jewell is the senior partner of the firm of Jewell Brothers, flour merchants of Brooklyn, and is also inspector of Rifle Practice in the Fifth Brigade of that city."

The team held a meeting at the Hoffman House on Wednesday, preliminary to appointing a captain.

Mr. G. S. Schermerhorn, Jr., Secretary of the National Rifle Association, has received a letter from Mr. P. B. Walker, of Sydney, Honorary Secretary of the New South Wales Rifle Association, informing him of the preparations made by the riflemen of Australia to join in the Centennial International Match. Mr. Walker states that the committee appointed by the council of his association to make arrangements for sending a team to America, in conjunction with Victoria, decided on May 5th that the New South Wales "five" should proceed to San Francisco by steamer, leaving June 30th, and may therefore be expected here about the beginning of August. The writer adds

that he understood the representatives of Victoria would leave Melbourne on May 14th, and proceed to New York via Suez and England.

At a competition of Scotch riflemen for places on their international team on the 14th inst, the following score was made out of a possible 225, each man shooting 15 shots at 800, 900, and 1,000 yards:—

Name.	Total.	Name.	Total.
Clews	180	Campbell	161
Whitelaw	175	McVittie	159
Boyd	173	Duncan	158
McKerrell	173	Fraser	157
Rae	172	Menzies	155
Thorburn	168	McIsaac	151
Gilmour	165	Findlay	151
Mitchell	164	Smith	146
Burgess	161	Brewster	145
Clarke	161	McIntyre	144
Paton	161	Watson	141
Lake	161	Riddell	134

The weather was bad, and there was a heavy gale while the men were shooting at long ranges.

CREEDMOOR.—Two matches were shot at Creedmoor, under not very favorable circumstances, the wind being gusty and uncertain. The first was for the Hepburn trophy at long range, for which there were thirteen competitors, Mr. E. H. Sandford being the winner by a score of 185 out of a possible 225 points. The following are the scores:—

Name.	800 Yds.	900 Yds.	1000 Yds.	Total.
E. H. Sanford	60	61	64	185
A. J. Roux	68	61	53	182
Lieut. Col. W. B. Farwell	66	66	50	182
R. Rathbone	47	66	57	170
W. S. Elmendorf	55	60	47	162
H. Fisher	62	49	49	160
Isaac L. Allen	52	60	48	160
Major H. S. Jewell	60	61	37	158
A. V. Canfield, Jr	46	52	52	150
D. F. Davids	50	56	35	141
A. Anderson	46	45	44	135
E. H. Madison	49	41	42	132

The second match was for the *Spirit of the Times* badge for which there were thirty-nine competitors, the conditions being ten shots each at 200 yards off-hand. The following are some of the best scores:—

Name.	Total.	Name.	Total.
Henry Fulton	35	E. H. Sanford	30
Isaac L. Allen	35	Col. B. E. Valentine	30
W. B. Farwell	33	A. Anderson	30
C. E. Blydenburgh	32	F. R. Hutton	29
G. E. Moore	32	H. Fisher	29
J. P. M. Richards	31	George Waterman	29
R. Biggins	31	C. H. Eagle	29

To-day the Third Brigade practices, to-morrow the Second Brigade and on Saturday the matches comprise the third competition for the "Geiger" trophy, at 1,000, 900, and 800 yards, open only to members of the Amateur Rifle Club; and first competition for the "marksman's" badge, presented by Mr. H. C. Poppenhusen, at 200 and 500 yards, with military (State model) rifles only.

NEW YORK.—The spring meeting of the Sixth Division Rifle Association was held at Syracuse last week, opening with the Director's match, 5 shots each at 100 and 200 yards. There were eight entries, Capt. John A. Nichols being the winner with a score of 37 out of a possible 50. In the regimental team match, 6 men, 5 shots each at 200 and 500 yards, the Forty-fourth Regiment, of Albany, made 203 points out of a possible 300; the Forty-fourth Battalion, of Binghamton, 192 points, and the Forty-eighth Regiment, of Oswego, 189 points. The short-range match was next shot, for which there were 24 entries, 18 of whom used military rifles. Distances 100 and 200 yards, 5 shots at each range. J. S. Barton, of Oswego, took the first prize, an order for a suit of clothes, making 46 out of a possible 50.

The second day's proceedings opened with the mid-range match, open to all comers, distances 500 yards for military rifles and 700 yards for Creedmoor rifles. In this match there were 31 entries, Mr. L. L. Barnes winning with a score of 23 points out of a possible 25. The officers' match had 11 entries, and was won by Capt. Jennings with a score of 43 points, the conditions being 5 shots each at 100 and 200 yards. The Duncan gold badge, 5 shots each at 200 and 500 yards, was won by Mr. L. L. Barnes with a score of 39 points. The last and most important event of the meeting was the long-range match, shot at 800 and 900 yards, 10 shots at each distance. There were several entries, and the first prize was won by Mr. L. L. Hepburn. The scores were as follows:—

Name.	800 yds.	1000 yds.	Total.
L. L. Hepburn	43	45	88
H. H. Hart	42	39	81
H. Fisher	44	31	75
A. B. Smith	40	30	70
J. A. Nichols	36	32	68
Dr. C. E. Rider	47	14	61
Col. Manning	36	4	40

Of the success of the meeting the *Standard* says:—

"This meeting, the first under the auspices of the Sixth Division Rifle Association, and the opening one upon the new range, was a success in every respect. Distinguished riflemen from abroad pronounced it more largely attended and more successfully carried out than in the opening meeting of several other ranges in this State, and the Adjutant General and Inspector General, who were present, complimented the association upon the finely located and laid-out range, which is the best in the State, as to location and general formation of the ground, except that at Creedmoor. The range will hereafter be open to practice, and during the present summer it will be made frequent use of by the members of the National Guard of this city and vicinity."

—The second contest for the champion diamond badge of the Jamaica Rod and Rifle Association took place on their range at the village of Jamaica on Wednesday last, with fourteen competitors. The President, George H. Creed, Esq., was the successful shooter, making 42 out of a possible 50, 200 yards, off-hand. The following is the score:—

Name.	Total.	Name.	Total.
George H. Creed	42	Thomas Lloyd	35
Theodore Rogers	42	George A. Dicks	35
John M. Crane	40	Elbert N. Remson	31
John Fleming	40	Thomas B. Fish	28
C. J. Stewart	38	Charles A. Prior	27
John B. Feary	36	Wm. Durland, Jr	26
George W. Damon	36	Joseph Bowden	24

At a practice shoot on Monday last Mr. Theodore Rogers scored 44 out of a possible 50; John M. Crane, 41, and George M. Creed, 40. Mr. C. J. Stewart, a member of the club, has offered a prize of a silver cup, value $25, to be taken by the first member who shall make seven bull's-eyes in succession at 200 yards, either at a practice or in a match. The challenge badge, shot for every Saturday, continues to change hands, having been won by Mr. Theodore Rogers on Saturday last by a score of 31 out of a possible 35.

NEW JERSEY.—The 19th annual shooting festival of the New York Schuetzen corps took place the 12th, 13th, and 14th inst., in the Schnetzen Park at Union Hill. Following are given the principal scores at all the targets, distance of all the targets being 200 yards, off-hand shooting. Ring target; divided in 25 equal rings, each of ¼ inch diameter; possible score 75; 18 rings being a bull's-eye at Creedmoor:—

No.	Name.	Rings.	No.	Name.	Rings.
1.	John J. Rathjen	70	4.	Henry Knebel	63
2.	John Rein	63	5.	G. A. Kaulubli	61
3.	H. Miller	62	6.	William Hayes	61

Man Target, divided in 10 perpendicular lines of 1 inch diameter; possible score, 50.

No.	Names.	Lines.	No.	Names.	Lines.
1.	J. J. Rathjen	48	4.	William Hahn	43
2.	J. Blumenberg	45	5.	A. Zengner	43
3.	William Hayes	43	6.	John Rein	42

Creedmoor Target, same regulations as at Creedmoor, 5 shots.

No.	Name.	Score.	No.	Name.	Score.
1.	J. Morf	23	5.	William Hahn	21
2.	J. Klee	23	6.	Ph. Klein	21
3.	Ph. Jacoby	20	7.	John Rein	20
4.	J. J. Rathjen	22	8.	William Kubely	20

Bull's-eye Targets.

No.	Name.	Degrees.	No.	Name.	Degrees.
Best.	R. Faber	48¾	6.	J. Morf	81½
2.	John Rasehen	55	7.	William Hahn	91
3.	Ph. Jacoby	64	8.	A. Hellwig	91½
4.	A. Zengner	70	9.	J. Tobler	93½
5.	Ph. Klein	80½	10.	L. Laoo	105½

Most bull's eyes, J. J. Rathjen, gold medal and $15 cash; second, A. Hellwig, $10; third, Ph. Jacoby, $8; fourth, J. H. Rasehen, $6. All the shooters of New York and vicinity leave for Philadelphia next Sunday evening, to attend the grand shooting tournament in that city, which is to be held from June 25th to July 1st. Team shooting will take place the 6th of July.

WISCONSIN.—The fourth competition at 500 yards for the Brodhead field-glass prize came off at Milwaukee the 2d inst. Fielding and Bangs tied; Fielding won by Wingate's rules counting back singly from last to first, 15 shots each:—

Name.	Total.	Name.	Total.
Fielding	72	Meunier	65
Bangs	72	Johnston	53
Turner	68	Hawley	42

The sixth contest at 200 yards for the Brodhead field-glass prize came off on the 9th inst. Meunier and Fielding tied. Meunier wins by fewest inners, and holds the glass, having won it three times; 10 shots each:—

Name.	Total.	Name.	Total.
Meunier	43	Yale	36
Fielding	43	Ormsby	35
Bangs	38	Turner	34
Allison	37	T. W. Hawley	34
Hawley	37	WAU NAU.	

NOVEL LIST OF PRIZES.—The riflemen of the city of Toronto have taken a new departure in the class of articles to be given for prizes. Among other curious and useful things which we find enumerated as won at a recent shoot there are found "six dollars and a case of razors," "five dollars and a box of cigars," "four dollars and a pair of boots," "four dollars and a teapot," "five dollars and a barrel of ale," "three dollars and a violin," "three dollars and a pair of boots."

There is something substantial in the above, but the man who won the barrel of ale will need to control himself or he may not be in condition to shoot at the next meeting. Cigars are bad things for the nerves, according to the doctors, and in offering them for prizes some one may have had an intention to weaken the nerves of the shooters. A case of razors can be put to good use occasionally, and may perhaps assist the winner to do sharp shooting. The boots will enable somebody to "walk off" on something besides his auricular organ the first time he is beaten, and on the whole the prizes have been selected with much judgment. —*Syracuse Standard.*

Game Bag and Gun.

PIGEON MATCHES.

IOWA.—A friendly match between several gentlemen of Clinton, Iowa, was shot a few days since. The conditions were the usual ones of 21 yards rise, 80 yards boundary. The following scores were made at 10 birds each:—

Name.	Total.	Name.	Total.
L. Lamb	2	B. Gage	9
C. O. Morton	4	F. Gage	7
F. H. Juckett	8	J. Jones	9
G. E. Poyneer	9	B. Lellingwell	9

At a shooting match between twelve of the members of the Council Bluffs Sportsman's Club, which came off on the 12th inst., 26 yards rise, 80 yards boundary, 1¼ oz. shot, shot from five traps, the following scores were made:

Name.	Score.	Total.	Name.	Score.	Total.
Montgomery	0 1 1 0 0 0 1 0 0 0	3	Morse	0 1 1 1 1 1 1 1 1 1	8
Hoffmayr	1 1 1 1 1 0 1 1 1 1	9	Oliver	1 1 1 1 1 1 1 1 1 1	9
Haywood	1 1 1 1 1 1 1 1 1 1	10	Bersheim	1 1 0 1 0 1 0 1 1 1	6
Bowman	1 1 1 1 1 1 0 1 1 1	9	Weightman	1 0 1 2 1 1 0 1 1 1	8
Pifer	1 1 1 1 1 0 1 1 1 1	9	Keller	1 0 1 1 : 0 0 1 1 0	6
Babbitt	1 1 1 1 1 1 1 1 0 1	9	Mullis	1 0 1 0 1 1 1 1 1 1	8
Total		49	Total		45

After which a double-bird match was shot at three pairs double birds by the following gentlemen with the following result:—

Name.	Score.	Total.	Name.	Score.	Total.
Oliver	10 10 11	4	Hoffmayr	10 00 11	3
Pifer	11 11 00	4	Mullis	10 01 10	3
TIES.					
Hoffmayr	11 14	4	Mullis	11 00	2

J. W. Morse and B. F. Montgomery shot at two pairs with the following score: Morse—10 00-1; Montgomery 10 00-1. This ended the afternoon's sport.

E. P. A. P.

—The jolly "Early Birds" arose again for their spring excursion, on Thursday, June 15th, taking a trip to Mr. Dooley's rural hotel. It was evident that the few swift "blue rocks" of that last turn out had given them a good lesson in caution, the score being as follows, 6 birds each:

Name.	Score.	Total.	Name.	Score.	Total.
Aug. Petrie	1 0 1 1 1 0	5	D. Stehl	1 0 0 1 1 1	4
Joseph Zaengle	1 0 0 1 1 0	3	A. Harlem	0 0 1 1 1 1	4
H. Keller	1 1 0 1 1 1	5	Th. Krauss	1 1 1 1 1 1	6
Felix Horn	1 1 0 1 1 1	5	J. Koebler	1 0 1 0 1 1	4
D. Flecke	0 1 1 1 0 1	4			

ED KUHS, Sec. THEO. KRAUSS, Prest.

PHILADELPHIA, June 20th, 1876.

EDITOR FOREST AND STREAM:—

The quarterly match for the club medals were shot at Echo Park (8 birds, 21 yards rise, 80 yards boundary, club rules) by the members of the Kensington Hunting Club, Philadelphia and their friends, the members of the First German Hunting Club of New York. The score is below:—

KENSINGTON HUNTING CLUB.

Name.	Total.	Name.	Total.
J. Gundele	4	C. Heppner	4
E. Steee	6	G. Nagel	3
F. Retz	4	Charles Hebding	4
Charles Metzger	5	William Grober	2
J. Sonneck	5	L. Holzschieder	3
Charles Haug	4	A. Scheuringer	3
F. Widmayer	7	William Pfeiffer	3
J. Steiger	6	M. Erlerly	5
Fr. Delsenroth	8	M. Heppner	2

TEACHING THE YOUNG IDEA TO SHOOT.—A Massachusetts correspondent sends the following:—

There is a proclivity not strange, to fear the use of powder and shot. "Is that gun loaded?" "Oh, no." "Do put it up, it might go off." So it is that the lady darlings are in a fever whenever there is a gun in a boy's hands. This fear is natnral, and more, it is right on general principles. However, a gun with powder and shot is as safe as a dipped candle in the hands of any lad whose father knows enough of sporting materials to teach him their uses. Take the gun to pieces: then put it together, and so do until the machinery is learned. Give him aim with bow and arrow, or parlor rifle. Explain flight, speed, windage; then try him on tho wing, never on the ground or in the tree. If the lad he eight or ten years of age, then he as well as all the family will be out of all danger, and cured of fear. Of course the motion, carriage of gnn, passing fences, and jumping ditches, comes under the head of preliminary instruction. I know another grandson, now fourteen years of age who kills the snipe lost by older sportsmen, and has snatched the quail from two experienced shots, right and left; more, and illnstrative of proper teaching, hath slain his deer on the jnmp, which had passed the deadly rifles of several hnnters. With all this he has no vain-glory in it. Wonder ceased, and useful studies find devotion inspired by love of success, while the hoyish love for promiseuous use of gun and bird murdering finds no place in his regulated mind.

Indeed the modest sympathy of the banished duke seems to be pervading all his thought:—

> "Come me, shall we go and kill us venison?
> And yet it irks me. The poor dappled fools—
> Being native burghers of this desert city,
> Should, in their own confines, with forked heads,
> Have their round haunches gored."

This means that boys have no busiuess with gnns unless the father or some competent person instructs them thoroughly in the uses of these deadly, dangerous instrnments. The education gives self confidence, great care, and takes off the edge of careless or truant indulgence with powder and shot. This youth can entice a trout with eqnal skill, and is easily satisfied with enough, as old Leatherstocking with his single partridge.

—We have received from the White Manufacturing Co., Bridgeport, Connecticut, a small pocket jack lamp which is just the thing to show the hunter his way through swamps and thick brush, when making a short cut to camp at night. It burns kerosene, gives a large light, and is just the thing for the stable or camp, and general use. It is about 6 in. high, 2¾ in. wide, and 1¾ in. deep, making a small yet powerful lantern, large enough to shine a deer. Every man ought to have one either in camp or at home. We presume they can be made of any size.

WISCONSIN.—*Montello, June 13th.*—Pinnated grouse are quite abundant in this section, and the coming shooting season promises rare sport on this species of shooting. But very few if any nests have been destroyed this season by burning the dry grass on the lowlands, as has been done to a great extent years before. Snipe have been very scarce in this section this last spring. FRED.

VELOCITY AND CLOSENESS.

59 ST. JAMES STREET, LONDON, May 24th, 1876.

EDITOR FOREST AND STREAM:—

In your impression of the 11th instant appears a letter over the signature of George C. Eyrich, in which your correspondent quotes from some public or private writing of mine these few isolated words—"closeness and velocity are antagonistic"—and then challenges my correctness. As a public writer of repute, I might be induced to leave the letter unanswered, feeling assured that all who read my published works, or correspond with me privately, know that I never in my life made such an axiomatic or sweeping statement, and that the words quoted (but with "were," not "are,") are only ever used by me to illustrate the improvement now made in the art of boring gun barrels. To correct the erroneous impression which Mr. Eyrich's letter conveys, I think it only just to your readers and myself to make this reply. I must premise that isolated cases, without the context, may be made to mean almost anything, and should never be so made.

I have used, and do now use, the words quoted solely in the past tense, and only in explaining that, whereas by the old mode of boring barrels "closeness and velocity *were* antagonistic," by the new mode these invaluable qualities *are* reconciled, and I challenge all and sundry to produce any other statement. I have made it my careful duty at all times since the improvement was introduced to explain that formerly barrels as a rule shot in the first instance (that is, before we began the regulating boring) with rude and ill regulated force. The art of boring them lay in so far regulating this force, and causing the gun to throw its shot more closely and evenly, or, in other words, to produce a good pattern on the target. But, and the fact is beyond all challenge, every touch of the tool in producing pattern, or closeness, diminished velocity, and therefore the two were antagonistic. The best shooting gun that could be produced on the old boring was only a compromise, giving high velocity you diminished the closeness; giving closeness you diminished the velocity.

The new boring, by which the fine lines in the interior of this barrel are quite altered (lines so fine that I measure mine with a micrometer showing one thousandth of an inch in variation of calibre), has altered

all this, and velocity and closeness are now reconciled; and in this great fact lies the modern improvement. This is what I have stated all along for the four years I have practiced the new system.

In the exact lines of boring, as now used, perhaps no two gunmakers agree, and I may state that no mere fine measurement will produce good shooting, because the elasticity of metal varies so greatly, while occult causes prevent any attempt to turn out guns to shoot in the highest style without prolonged and expensive trials. The micrometer is only called into service in a difficulty, or for curiosity in endeavoring to account for the peculiarities of some particular gun. All scientific artillerists know that there is no "royal road" in gunnery, and hence governments spend vast sums yearly in experimentation. It is the same with high class gunmakers, whose profits are in a large degree absorbed by the labor and time so expended, to which has now to be added the greater cost of ammunition for breech loaders—no shells being loaded twice—and the very best of everything being used to arrive at proper results. Your readers will perceive that there is a vast difference between "arc," as applied to gunnery in an assumed axiom, and "were" as applied to an erroneous system of boring; and perhaps Mr. Eyrich should re peruse whatever document he quotes from, and also, in justice, publish its date. If ever I used the word "arc" it must have been previously to the new boring, and therefore perfectly correct in the then existing state of matters.

It is perhaps hardly worth while to show that Mr. Eyrich's experiments are the very reverse of analogous, but I have seen in my time so many extraordinary experiments reported and assertions made in controversies on gunnery that I have ceased to be surprised at anything. All the conditions are coolly altered, and then the results are triumphantly published as being beyond question a refutation of some opposing theory—to fire loose shot at a plank, to then concentrate shot so that a large number would strike upon a small space of the plank, and finally, to make small bombs and discharge them against the same plank, and then draw any deduction regarding the general question of velocity and closeness of loose shot, as affected by boring the barrel, is so extraordinary an experiment, so fallacious, that I am only restrained from writing in adequate terms about it by a respect for American sportsmen, many of whom are deeply skilled in these matters, and by the knowledge that as gravu blunders have been committed in this country by men who pretended to be leaders of public opinion. I have also known men of the highest scientific attainments make such astounding blunders in gunnery—as in the famous discussion between Mr. Bessemer, the inventor of the new steel manufacturing process, and myself, in the London *Times* some years ago—that I am forced to the conclusion that anything like an approach to correct knowledge therein is only reached by an original natural adaptation, followed by extended experience. In the *Times* discussion, Mr. Bessemer fell into the astounding delusion that steam would drive small bullets from a rifle with as great velocity and as far as gunpowder because he could drive steam itself through a tube with a velocity of 1,600 feet a second, about equal to the initial velocity of a rifle ball. But he forgot all the retarding forces, and that gunpowder starts with a velocity not of 1,600, but of 7,000 feet a second! The retarding forces diminish the expanding rate of the powder, as affecting the projectile, from 7,000 to 1,600 feet. Mr. Bessemer argued that he had only to envelop the ball in a fluid (steam), traveling at 1,600 feet, to send it 1,600 feet. But he forgot that to do so he must make the steam accompany the bullet all the way. I give this case in no spirit of triumph, but as, from Mr. Bessemer's high scientific position, one of the most illustrative I can call to mind at this moment.

To conclude, if any one interested in these matters will take the trouble to refer to my latest publication—"Shooting, &c.," Messrs. Sampson, Low & Co., London—they will find that, so far am I from asserting that "closeness and velocity are antagonistic," at page 109 I demonstrate in reference to the highest and most improved shooting that the velocity of No. 6 English shot is at least at the rate of 2 280 feet a second over forty yards, and as a matter of course, with the small momentum of birding shot, the initial velocity is very much greater, but of a rifle ball, which will go a mile, being only some 1,600 feet, and all this with "closeness." J. D. DOUGALL.

DUCKS ON THE KANKAKEE.

LA PORTE, Ind., May 22d, 1876.

EDITOR FOREST AND STREAM:—

In your issue of May 18th, I observe two letters, one from St. Louis, from "Romer," and one from Pittsburgh, from "South Fork." During the last twenty years I have spent more or less time upon the Kankakee River and marshes, in the fall of each year. Though not much of a shot, but loving the sport, I have become somewhat familiar with the habits of the ducks and geese, as they frequent this part of the country. Ten years ago the wood duck, mallard, and both kinds of teal were plenty, and geese visited our wheat fields in the fall in large numbers. Then there was but little shooting in the spring on the river or marshes. The ducks and geese bred plentifully, and in the fall we had fine sport, but our game of this sort has been growing less, until last fall there was none of any consequence.

I attribute this to two causes: First, the shooting in the spring; and second, the increased number of gunners. Those kinds of ducks above mentioned used to breed in the marshes in great numbers, but since the spring shooting has become so prevalent, continuing, as "South Fork" says, after the birds are mated, it has driven them away to seek other homes. I think, as "Romer" says, nothing but the entire prohibition of spring shooting will do any good. There are several kinds of the duck family that only stop to feed and rest in the spring. Such are the bluebill, sprig-tail, red-head, all of which but the first named, migrate further north to find their breeding grounds, and return to us in the fall, but now in greatly diminished numbers. I do not pretend to say what other route they take southward, but do say that from the best information I can obtain from FOREST AND STREAM and other sources, they systematically avoid us. I have no doubt that if the spring shooting was entirely stopped, we should have something like old times in the fall again.

I think "South Fork" is laboring under a wrong impression. From my observation I judge that the ducks and geese—ducks first—came up the Mississippi from the south, then up the Ohio, and so on up the Illinois branches of the Ohio until they reach us, feeding along and following up the opening spring; and if perchance there comes a cold snap they put back to warmer weather and remain until the cold abates. If our shooting is no better the coming than the last fall, we shall be compelled to take the advice heretofore given: "Go West and grow up with the country." NORTH FORK.

THE KAY CARTRIDGE.

NEWARK, June 9th 1876.

EDITOR FOREST AND STREAM:—

In looking over your spirited paper of June 1st we notice an article over the signature of "Old Sportsman," relative to our concentrating cartridge, which we think calculated to produce wrong impressions among gentlemen sportsmen who are partial to the gun and dog.

With your kind permission, we will make the following explanations relative to our cartridge and its proper uses. First. Ely's brown paper shells for 12-gauge guns will not crease properly when loaded in the manner in which "Old Sportsman" says he loaded his—first, three and a half drachms powder; next, two common wads; third, one of our cartridges on the top; then crease. With such loading the result of the shooting is not to be wondered at. Any disinterested sportsman can try this manner of loading shells, and he will find out that the above named shell cannot be creased when loaded in that way except by crushing the roll at the top of our cartridge, and which confines the concentrator. To crush or damage this roll destroys the value of our cartridge altogether. "Old Sportsman" might as well knock the bottom out of his glass and then complain that it did not hold its contents. The same make and grade of shell for a 10-gauge gun will take the load exactly as "Old Sportsman" says, and crease properly from the simple fact of their being about three-eighths of an inch longer than those for 12-gauge.

It is a well established fact among gentlemen who have tried them that the Kay cartridge concentrator will shoot proportionally better at any given distance, from the same gun, than loose shot, other things being equal; but when the very strength of our cartridge is destroyed by breaking the roll at the head of it, by forcing a creaser over it in the manner described, we don't think it is getting very fair treatment, and the cartridges cannot possibly do themselves, or the gentleman using them, justice. At the present standard of forty yards distance, thirty inch circle, the penetration, pattern, &c., is so much better than has heretofore been achieved with loose shot that there is really no comparison between them.

In loading our make of cartridge concentrators into shells, and then using a creaser, we would suggest to sportsmen and others that a wad on the end of the crease plug just the thickness of the cartridge roll will prevent the plug from going too deep into the shell and so breaking down the roll, thereby destroying the merit of the cartridge. A little care exercised in loading shells with our cartridge concentrator will give most satisfactory results to the parties using them.

There are a couple of other points in "Old Sportsman's" communication that we think are open for explanation, but not from us. How does "Old Sportsman" manage to get twenty cartridges of 1 1-16 ounces each out of the pound of cartridges that he bought? If Philadelphia dealers are so liberal in their weights this Centennial year we should like to have their addresses, to profit by their liberality. Next, in giving you this statement of his shooting with our cartridge, after destroying its merits, why did he not make a comparison with some shooting of loose shot from the same gun? The fault could hardly lie with the gun, for we all know that Scott's makes are good.

By way of finishing this communication, permit us to suggest, for the benefit of "Old Sportsman," that there are always two sides to a question, and that when he sees fit to try our concentrators again to do so fairly. Then try the loose shot from the same gun, distances, loads, &c., being equal for his comparisons. We will cheerfully abide by the results.

ALLAN B. KAY & Co.

Rational Pastimes.

THE CURLERS' CONVENTION.

THE tenth annual convention of the Grand National Curling Club of America was held on Wednesday last at Taylor's Hotel, Jersey City. The convention, if not one of the most numerously attended, was one of the best held by the Grand National. The delegates were solid, representative men, who have met with success in the world as well as on the ice.

The Executive Committee met at 1:15 P. M, Mr. John L. Hamilton, of New York, President of the Grand National in the chair. On the roll being called it was found that the following cities were represented:—Caledonian, New York—John Laughlaud; New York, New York—John Paterson; Caledonian, Buffalo—George Macnoe; Jersey City Club—James Steveos; Buros, Cleveland—Hugh Crawford; Burns, Ogdensburgh—William Cougalton; Milwaukee, Milwaukee—D. Foulis (proxy); Chicago, Chicago—Andrew Davidson (proxy); S. Andrews, N. Y.—A. Dalrymple; Albany, N. Y.—T. M. McCredie, Sr.; Paterson, Paterson—John Guoo; Thistle, N. Y.—Wm. Mckie; Caledonian, Brooklyn—A. D. Baird; Empire City, N. Y.—S. McIntyre; Thistle, Chicago—L. T. Martin; Thistle, Brooklyo—W. W. Watkins; Troy City—Joseph Hione; Ivanhoe, Paterson—H. L. Butler; Mahattao, New York—P. B. Shields; Newark—Alex. Phillips; Buros, N. Y.—Wm. Hogg; Utica, N. Y.—Isaac Whiffen; Portage City, Wis.—A. Hoaglaod (proxy).

There were thus only seven clubs unrepresented, viz: Orchard Lake; Yookers, N. Y.; Thistle, Detroit; Granite, Detroit; Four Brothers, Canada; St. Lawrence, Prescol, Ontario; Toledo, Ohio.

An application from the Burns Club of Toledo for admission into membership with the Grand National was granted. A letter was read from the Cleveland Burns Club as to a dispute about a medal match between them and the Caledonian Club of Buffalo. The Buffalo Club being willing to give it up, the convention ordered the medal to be handed over to the delegates from Cleveland. It was resolved that all medals not played for last winter be played for next season by the clubs already pitted against each other, and that the place be named by the umpire; also that the Annual be published as usual.

A dispute between the Paterson and Empire City Clubs was referred to the Committee on Distribution of Medals. The following committee was appointed on the distribution of medals:—Messrs. A. Dalrymple, James Stevens, H. Crawford, Isaac Whiffen, L. T. Martin, Thomas McCredie, and W. Meikle. On motion, carried that to article six of the Quoiting Rules, as given last year in FOREST AND STREAM, the following addition be made: "But that each player shall be allowed to name a person to put up a mark as a guide."

The general meeting was called to order by President J. L. Hamilton. The minutes of the Executive Committee were read aod approved. The auditing committee having reported, the Committee on Distributioo of Medals handed in the following list of medal matches to be played next winter:—

Chicago Club vs. Thistle, Chicago; Milwaukee vs. Portage City; Granite, Detroit vs. Detroit; Troy City vs. Utica; Burns, Cleveland vs. Toledo Burns; Buffalo Caledonian vs. Four Brothers; Burns, Ogdensburg, vs. Prescot; Jersey City vs. New York Thistle; New York Caledonian vs. Albany; St. Andrews, New York, vs. Empire City; Paterson vs. Yonkers; Burns, New York, vs. Ivanhoe, Paterson; Manhattan, New York, vs. Caledonian, Brooklyn; Thistle, Brooklyn, vs. New York. Newark to have a point medal. Orchard Lake to have a point medal. Paterson and Empire City to be called again. Cleveland and Utica to play again on the first opportunity at Buffalo, and either failing to come up to time to forfeit the medal. The Garoon medal to be played for next winter at Chicago.

The above report was received and adopted and the Committee discharged.

On motion carried that vulcanite stones be admitted into competitions where other stones are being used.

On motion carried that "the rules drawn up for guidance in the match for the Bell Champion Quoit be published every year in the annual along with the rules of curling."

The question of an Inter-State match was disposed of by the carrying of the following motion:—"That the G. N. C. C. endorses the action of its officers in carrying out the Inter-State match, that it be played for hereafter under the auspices of the G. N. C. C., and that the expense be borne by the clubs participating." It was then decided that the next convention meet at Chicago.

After the President's address, and the passing of a hearty vote of thanks to Mr. Hamilton for the able and courteous manner in which he had discharged for two years the duties of President, the convention took up the election of officers, with the following result:—

President, Mr. John L. Hamilton, of New York; First Vice-President, Mr. L. T. Martin, of Chicago; Second Vice President, Mr. Alex. Phillips, of Newark; Secretary and Treasurer, Mr. David Foulis, of New York.

THE QUOITING MATCH.

The annual match for the Bell Champion silver quoit, open to all members of the Grand National Curling Club, came off on Thursday in a park at Lafayette, near Jersey City Curling Rink. Twenty-six players entered for the first tie. The concluding ties were as follows:—

THIRD TIE.

Name.	Score.	Name.	Score.
James Stevens	21	George Henderson	15
A. McGregor	21	George Grieve	18
J. Love	21	W. Meikle	19

S. McConchie a bye.

FOURTH TIE.

S. McConchie	21	James Stevens	13
A. McGregor	21	J. Love	9

FINAL TIE.

A. McGregor	21	S. McConchie	20

Mr. McGregor, who hails from Newark, was presented with the champion medal by President Hamilton, and after one of the most harmonious and enjoyable conventions in the record of the Grand National, the members dispersed.

BASE BALL.

—The first eastern tour of the western nines ended on June 17th, and the result will be found in the appended record of what each club did on won games:—

WEST.		EAST.	
Club.	Won.	Club.	Won.

Games lost	4	4	10	13	14	14	15	20	94
Games played	24	22	24	23	24	24	23	24	188

—A game of base ball was played at West Chester, Pa., on the 12th inst., between the Broadywine Club of that place, and the Kleinz Club of Philadelphia, both amateurs, which resulted in favor of the former club by a score of 14 to 8.

CRICKET.

—The game between the Young Americas and Germantowns was finished at Philadelphia on Wednesday last. The average made by the Young Americas was not kept up as well as might have been expected, the strong batters, Large and Chas. Newhall not doing half so well as expected. The Young America had still 23 runs to make when the last wicket fell. It was the best game played here for a long time, but if the same attention was paid to the perfecting of the general fielding as there is to batting, bowling, and perhaps wicket keeping, scores would not be run nearly so high. The average cricketer seems to think that if he puts on pads and stands bawling for an hour or so there is no need of his doing more unless he is likely to be a bowler. This is a mistake. Let our cricketers get well up in fielding, and then teams from "all over everywhere" will have more than their hands full when they meet them. SCULLS.

On Saturday the St. George's Secood Eleven play a match at Hoboken with the St. Paul's school of Concord, N. H. On Monday the St. Georges go to Philadelphia, and play a match with the Young America Club of that city, and on Tuesday they play the Germantown club.

—A contributor to the New Haven *Journal* gives warning that the potato beetle must be handled cationsly by persons having cuts or bruises through which poison may be disseminated, and utters an especial caution to avoid the inhalation of volatile odors arising from scalding, burning or crushing considerable numbers at a time. This work should not, therefore, be committed to children.

—Over two hundred acres of watermelons, grown near Live Oak, will be shipped north by rail this season.

—Abdul Asiz is now Abdul as was.

—An aim in life will make a name in life.

HURST'S

Stereoscopic Studies

OF

Natural History

FOR OBJECT TBACHING IN SCHOOLS

And

PARLOR ENTERTAINNENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various animals and birds in grotesque attitudes, never, however, violating their natural instincts.

We offer these views, not as pictnres only, but as studies from nature. One of the great moving elements in our modern sys'em of education is object teaching. The onerring fidelity of the stereoscope transfers the animals and birds from their natural habitat to the rooms of the student and the fireside of our homes, where they cannot fail to have a last ing impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen, with its appropriate rocks, woods, or water, and coloring from the originals.

CORNELL UNIVERSITY,
ITHACA, March 14th, 1870.

I must congratulate you upon your great success in this new educational enterprise. If we can arrango our amusements so as to make them impart instruction to the mind, it will be a step in advance in education. EZRA CORNELL.

Prices: By the Dozen.....$3 00
By the Set of 5 Dozen, in Elegant Case, 16 00

These Stereoscopes are sold wholesale and retail by

BUY IT Vanity Fair.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.

I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first class.

For Sportsmen.

A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester.

Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.

A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.

We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.

Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

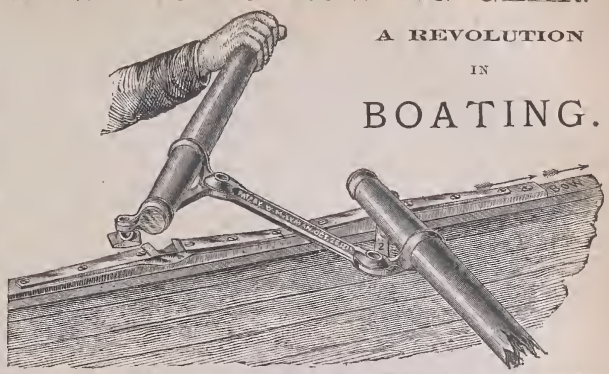
J. H. Hubbard,
nov18 tf Selling Agent, Cambridge, Mass.

RIFLE FOR SALE.

A Remington, 40 calibre, 70 grains powder, weighing about nine pounds. This rifle has been used but once; has pistol grip and full set of accoutrements, including 200 shells, 150 of which are loaded. Price for the lot, $50. Address this office. je15 tf

HIGHEST QUALITY DOUGALL Lock-fast Breech Loader, in case, with implements. No finer gun to the United States. Imported to order. Has never been shot, but must be sold. A bargain seldom offered. H. C. SQUIRES,
je15 3t 1 Cortlandt street,
Third door from Broadway.

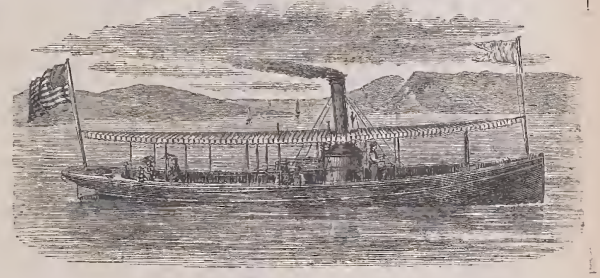
MEDALS OR BADGES.



We are now prepared to furnish badges or medals of any description at short notice. Having a first class designer, and every facility for making good work, we solicit orders from all associations, and will guarantee satisfaction. Designs for gold work furnished on application.

J. W. Hayes & Co.,
MANUFACTURING JEWELERS,
may11 3m 922 Broad street, Newark, N. J.

BOW-FACING ROWING GEAR.



A REVOLUTION
IN
BOATING.

This rowing gear is an invention which allows the rower to face forward instead of backward, pulling in the same manner as with the ordinary oars. The oarsman faces the direction in which he goes, and rows faster and more easily than with any other oar. The stroke is longer than with ordinary oars. The oars can be closed on out of the way without detaching them from the gunwale. The boatman makes no more effort in steering than in directing his course while walking. These oars can be attached to and detached from the boat very quickly, and they can be closed up in a convenient form for carrying. Can be attached to any boat, and is especially adapted to hunting, fishing, and all kinds of pleasure boating. Address, during Centennial, "Hunter's Camp" of Forest and Stream, Centennial Branch P. O., Philadelphia.

WM. LYMAN, Patentee.

Sportsmen's Routes.

THE "FISHING LINE."

Brook Trout and Grayling Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

The waters of the **Grand Traverse Region** and the **Michigan North Woods** are unsurpassed. If equalled, in the great abundance and variety of fish contained.

Brook Trout abound in the streams, and the famous **American Grayling** is found only in these waters.

Brook Trout Season opens May 1st.
Grayling season opens June 1st.

Black Bass, Pike, Pickerel, and Muscalonge are also found in large numbers in the many lakes and lakelets of this territory. The experimentalist can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive trips facilities are offered to tourists and sportsmen; also on and after July 1st **Mackinaw and Lake Superior Excursion Tickets.**

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, Send to Forest and Stream office, or address

J. H. PAGE, G. P. & T. A.,
may4 4m Grand Rapids, Mich.

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Negaunee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kamesknn, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, via the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last, named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GREESE, AND BRANT SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, W. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agt., Chicago.
ap16

TO SPORTSMEN:

THE PENNSYLVANIA R. R. COMP'Y

Respectfully invite attention to the

Superior Facilities

afforded by their lines for reaching most of the TROTTING PARKS and RACE COURSES in the Middle States. Dupont's

SPORTING, SHIPPING AND MINING

POWDER.

DUPONT'S GUNPOWDER MILLS

(ESTABLISHED IN 1801),

Have maintained their great reputation for 75 years. Manufacture the Celebrated

EAGLE DUCKING, EAGLE RIFLE, AND DIAMOND GRAIN POWDER.

The most Popular Powder in Use. Also,

Sporting, Mining, Shipping and Blasting Powder

Of all kinds and descriptions.

For sale in all parts of the country. Represented by

F. L. Knecland,

Feb 10-1y 70 Wall Street, New York.

The Hazard Powder Co.,

MANUFACTURERS OF

Gunpowder.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

Hazard's "American Sporting."

Nos. 1 (fine) to 5 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close, and with *great penetration.* For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½ and 6½ lbs. and cans of 5 lbs. FFFG is also packed in 1 and 5 lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.

SUPERIOR MINING AND BLASTING POWDER.

GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office,

88 Wall Street, New York.

FLORIDA.

40 Acres—$50.

Out of 650,000 acres of United States and State lands ceded to the ATLANTIC, GULF & WEST INDIA TRANSIT RAILROAD, 40 acres can now be

Selected for $50.

In the centre of the orange region, adjacent to a road running daily trains from Fernandina, on the Atlantic Ocean to Cedar Keys, on the Gulf of Mexico with the best HUNTING and FISHING in America, and almost free transportation given to each purchaser, these lands will be speedily bought up by actual settlers from all parts of the Union.

They compare favorably with THE BEST lands in the State, and are already surrounded by thrifty Northern and Western Settlers.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The *strongest* and *cleanest* Powder made. Nos. 1 to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6½ lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes. Sizes F.g. FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6½ lbs., and in canisters of 1 lb. and ½ lb.

All of the above give high velocities and less recoil than any other brands made.

BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.

SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER Co.,

26 Murray St., N. Y.

Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.

The undersigned is prepared to prove all the superior qualities he claims for his powder.

Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.

He challenges all rivalmen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 300 rounds equally divided at the three ranges; sighting shots extra.

Will shoot for money if desired.

The powder is also well adapted for shot guns.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressely for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker an any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing missfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents missfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2½ to 3¼ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen:—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,

A. H. BOGARDUS.

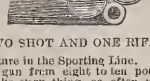
may13-1y

EDWINSON C. GREEN'S

BRIECH LOADERS,

CHELTENHAM, ENGLAND,

Are unsurpassed for material, workmanship, durability, and shooting qualities. Their superiority in shooting power has been shown wherever tested in this country and in England, standing first, second, and third at the New York trial in 1875, also the highest average at the London *Field* trial in 1875. A case of these guns made to order for sportsmen, and taken from stock, are shown at the Centennial Exhibition, Philadelphia, British Department. Prices, $15 to $250, currency. Those wanting a SUPERIOR gun at a MODERATE cost send for descriptive circular and price list to RUSSEL & HAYDENS,



Jacksonville, Illinois.

TESTIMONIALS.

From Hon. J. T. Headley, the Historian, Author of "Adirondack, or Life in the Woods," &c,

It is admirably written and has just enough of humor, sentiment, and description of scenery mixed, to make it delightful. The illustrations are well chosen and very effective, while the instructions respecting routes, localities, distances, outfits, &c., embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—a compliment that I trust will be properly appreciated for its extraordinary disinterestedness.

From Albert B. Street, the Poet, and Author of "Woods and Waters," "The Indian Pass," &c,

I think it is the *best* work on the forest that has appeared—superior in word-painting to Murray's, and full of wood-pictures and vivid scenes of camp-life. We realize that we are in the forest, are living with you in the scenes described, and that the trees are waving and the waters flowing over and by us. This, I think, the true test of a good book, impressing its reality and distinctive life on the mind. As a "Guide Book," it is most creditable and valuable. Indeed, it is the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for. It must have cost you intense application and labor. You may well be content that you have produced a good book.

From Benson J. Lossing, the Historian.

I have found those portions descriptive of the places which came under my personal observation, with the deepest interest, and most cheerfully testify to the general accuracy of your pictures as I recall impressions made of them at the dates of my visits. I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wonderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.

THE ORVIS REEL.

The Most Compact, Neatest, Cheapest, and Durable Reel in the Market.

NO 1.–This Reel is extra nickel-plated and finely finished. Is perforated to make it light, and keep it free from sand, also that the line may dry without removing it from the reel after use. Has a very perfect click. It is very light, very strong, and holds from 40 to 50 yards of line. It is more compact and less cumbersome than ordinary 20 yard reels. It is quite narrow, and takes up line rapidly. Put up in neat Black Walnut Case, price $5.

NO. 2.–For Prizes. Same style as No. 1. Heavy Gold Plate. Extra finish, with case, price $10.

Sent by mail, postage prepaid, on receipt of price, or by express, C. O. D. LIBERAL DISCOUNT TO THE TRADE. Send for NEW Price List of Fishing Rods, Reels, Flies, Lines, &c., &c. Mention this paper.

THE NEW

BOSTON
SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

W. H. HOLABIRD

Would most respectfully announce to his patrons and friends that he is prepared to make

Shooting and Fishing Suits

at the above prices. The tan dollar suit is better made than any competitor can offer for the same money. My original design having been appropriated by other manufacturers, I have been compelled to make many changes in the arrangement of pockets, &c., for which I have to thank the fraternity at large for suggestions. I believe that I have the BEST SHOOTING AND FISHING COATS IN THE WORLD,

and respectfully solicit your orders. I send my new illustrated Catalogue, 1d pages, free on application.

Dealers will find it to their advantage to handle my goods. They are better known and more highly esteemed than any other make.

CHAMPION GUNS OF ENGLAND.

PAPE'S

Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun.	Exhibitor.
1st—Greener	Greener.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards. Choke Bores.

1st—Pape	Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape	Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1¼ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original Invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

THE GREAT

London Gun Trial,

1875.

W. W. GREENER'S

Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: $75, gold; extra for extreme close shooting, $10. This will probably be the best chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & G. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

---

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

POPE'S

Rifle Air Pistol,

FOR TARGET PRACTICE.

Just the thing for sportsmen and military men. Shoots darts or slugs a distance of 50 feet. Perfectly accurate. By practicing with it one may become a dead shot. Each pistol is put up in a neat box, with 8 darts, 6 targets, 100 slugs, ramrod, claw, wrench, and skeleton gun stock. Price, $5; nickel plated, $6. Sent by mail on receipt of price and 35 cents postage.

One of the many testimonials from the Commander-in-Chief of the U. S. Army:—

"It is surely ingenious in mechanism, quite accurate in aim, and useful in preparing one for the more serious handling of the ordinary rifle.

W. T. SHERMAN, General."

POPE MANUFACTURING CO.,
Feb10tf 45 High Street, Boston.

Volume 6, Number 21. 17 Chatham St. (City Hall Sqr.)

The Hunter's Camp.

HALF way down the pretty Lansdowne Ravine, where the great untrimmed trees arch overhead, and the wild flowers grow in quiet nooks, the wearied sight seer finds the only exhibition of man's art worthy the sylvan aspect of the place, and feels that wildness inherent in every heart thrill within him as he catches sight of the smoke from FOREST AND STREAM's camp-fire. This romantic scene we portray in our full page illustration today.

The whole great Exhibition which the visitor has left behind him is an exposition of what men have wrought for gain, or to reduce to a further refinement the raw material in their natures and surroundings. The Hunter's Camp is life at the beginning. It shows the chosen home of the race when it had half emerged from the savage and brutish, but its senses were not yet blunted to the flavor of the woods and fields. It is a reminder of the world's youth when it was content to play and be happy. Then the streams were for pleasure and not for power; the savannas were for strolling and not for tilling; the forests were storehouses of game and nuts, and rarest flowers,—homes of the genii which it would be sacrilege to disturb at their revelry, or rob of their coverts among the ferns. All these pictures of the grand old woods and untamed rivers rise before one's eyes as he approaches this charming spot. The whole scene is one for quiet, rest and contemplation. It is poetic and picturesque. All the collections up above show how best to keep busy, and where a man may most profitably employ his time. FOREST AND STREAM here shows how to be leisurely—teaches us not to "loaf," but to "invite our souls" to those feasts of plenteous health, and that pleasing serenity and exhilaration which only communion with nature can induce.

What a place for rest! One may lie at full length under the trees listening to the delicate warbling of the smaller birds in the lofty foliage, or the louder songs of the thrushes and sparrows in the thickets among which the chatting of the squirrels sounds like a watchman's rattle. If he inclines to sleep, soft robes and blankets await him in the roomy cabin, where he can well dream of shooting grouse or playing with trout. Perchance his dull ear will catch such growls, as he sleeps, that a rough complexion will be given to his dream, and he will start from his fancied encounter with some fierce grizzly to find a real bear chained just out of his reach. If thirsty he can take the tin cup and go to the spring; if warm he can float on the cool lake in a birch-bark canoe; if loquacious he can fill his pipe and recount his adventures with other cronies by the smouldering fire.

The Hunter's Camp is a sugestion of that life of adventure and sport which every one loves whether he practices it or not; and which has equal charms for our fair sisters, many of whom also linger in its delightful vicinity. There is no need that there should be any expression of gratitude from them. The delighted faces and lingering backward glances of each one as he leaves, tells his thanks to FOREST AND STREAM for its pleasant surprise.

The Hunter's Camp not only attracts by its novelty and rude suggestiveness the crowds that stroll through the ravine, but it has received marked attention everywhere from our contemporaries of the newspaper press. *Harper's Weekly*, *The New York Weekly*, *Frank Leslie*, and others have illustrated it with full page engravings. The Public

1776. HUNTER'S CAMP. 1876.

Erected by FOREST AND STREAM Publishing Company, of New York, in Lansdowne Ravine, Centennial Exhibition Grounds, Philadelphia.

delphia papers, and the leading dailies of this city, Boston, Cincinnati, and other metropolitan towns, have all had their several pleasantries and encomiums to bestow, their banters at the inprovised hunters in buckskin and moccasins, and their flings at the bear. Some in their admiration of the creation, have forgotten to mention the genius who suggested and created, just as most men in receiving the good gifts of this life are apt to forget the Giver; but the editor of this journal need not feel slighted by the omission. The pleasure bestowed upon the sight-seers is satisfactory compensation, while it is sufficient to know that long after the Hunter's Camp is forgotten, lovers of nature will remember and seek for the delights of FOREST AND STREAM.

TROUTING SONG—A PARODY.

DEDICATED TO THE WILLEWEMOC CLUB.

BY G. W. V. S.

WHEN spring time comes and scatters o'er
The verdant meads full many a flower,
We vote our offices a bore,
And we go off a-trouting.
And then we have such jolly fun,
And such fantastic things are done
Upon the stream, that every one
Thinks nothing like it 'neath the sun.
Tangled whiskers, sunburnt nose,
Blistered feet and dripping clothes,
All for pleasure! so it goes,
When we go off a-trouting,
When we go off a-trouting, Oh!

And if the stormy Eastern wind
Its way unto our stream doth find,
We don't a continental mind,
While we are off a-trouting.
For then with cards and pocket pistol
We play, and often wet our whistle,
Or to our friends write an epistle.
And for the rain don't care a thistle.
Tangled whiskers, sunburnt nose,
Blistered feet and dripping clothes,
All for pleasure! so it goes,
Whoo we go off a-trouting,
When we go off a troutiog, Oh!

But if, perchance, there's too much gin,
Some foolish chap will tumble in,
And then arises quite a din,
While we are off a-trouting.
Or, mayhap, if the stones are all
Worn smooth, and bumps of caution small,
Some geot may cot an awkward sprawl,
Or sit down under a waterfall.
Tangled whiskers, sunburnt nose,
Blistered feet and dripping clothes,
All for pleasure! so it goes,
When we go off a-trouting,
When we go off a-troutiog, Oh!

And whoo at last, with empty well-filled creel.
We reach our home, how tired we feel!
'Tis then we eat a hearty meal,
When we got back from troutiog.
Around the board what tales we tell
Of big fish lost by broken snell,
Of red deer seen in woodland dell,
And all adventures that befell!
Well-brushed whiskers, cream-washed nose,
Slippered feet and warm, dry clothes,
Oh, what pleasure each one knows
When we get back from troutiog,
When we get back from troutiog, Oh!

For Forest and Stream.

Sporting in the Colonial Times.

TREATING OF OLD THINGS IN YE OLDEN TIME.

Wake! wake! night's lamps are fading fast,
The dappled dawn appears;
Hark! hark! the bugle's winding blast,
The hounds and hunter cheers.
With sinews braced their course they take,
And brush the early dew;
O'er hill and dale, thro' brush and brake,
The pack the game pursue.—*Old Hunting Song.*

IN the olden days of our country everything seems to have been different from our present epoch. It is doubtless true that human nature is the one unchangeable thing in this world, and the same feelings and passions possess all mankind alike, and made a man of thousands of years ago the identical man of to-day. But circumstances which surround mankind have much to do in moulding his character. The potent rules of his "order," the unwritten laws of the society in which he moves, the social education that he is unconsciously taught, and a hundred other intangible things all correspond to make the gentleman of the ancient *regime* utterly unlike his descendants of to-day; not so different, it may be, in their thoughts and feelings, but certainly the antipodes of us in their daily routine, and in their sports and pastimes. The sportsman of the past, to use a comparison, resembles as much his prototype of our epoch, as the long single-barrel, silver-rimmed, flint-lock fowling piece does our steel barrelled, patent back-action breech-loader, though in this instance comparison is not in favor of the latter. What our own sportsmen can do, and are daily doing, the columns of the FOREST AND STREAM keep us informed of and posted in its own graphic way; but how the Nimrods amused themselves with their sports and pastimes a hundred years or so ago, few, very few, know. And so I write this to show how the gentleman sportsman and the "cocked hat gentry" rode after the hounds, or chased the noble stag through the forests and across the streams of the Old Dominion. I want, if I can do so, to reproduce those ancient gentlemen in all their glory, and with all their surroundings.

In the time I speak of sporting was followed with a vim and devotion never seen with us; it was the all-absorbing pursuit of the country gentleman. The notes of the horn and the deep baying of the hounds was the sweetest music to his ear, and the brush of an "old red" the proudest trophy he could win. No engrossing business harrassed him and kept him chained to a routine of daily duty that addled his brain, destroyed his digestion, and made him pass sleepless nights; no daily morning and evening edition of the *Herald* or *News* held him in a perpetual ferment over political affairs, and in continual hot water with his friends on the other side; no busy railroad trains rattled through his estate, scaring the game away, and bringing from the cities the crowds of inevitable pot-hunters to shoot his birds and vex his soul; and, worse than all, no gangs of civil rights colored gentlemen, with old army muskets on their shoulders, and a score of mongrels and curs of low degree trooping at their heels, roamed at will through his domain, killing everything that had wings—tame or wild. No; these ills of modern growth were all unknown in those good old times. Then the gentleman had little to do beyond a general outlook over his plantation, which was governed on moderate principles. His was an easy-going existence, taking it as it came, riding fearlessly, laughing joyously, living easily, with no care on his mind, no strain on his nerves, he extracted all the bloom from the peach, all the sweetness from the flower; exercising his patriarchal sway wisely, reading his weekly mail—the Virginia *Gazette*, whose ponderous articles always put him to sleep—offering a hospitality without stint or limit, hunting the deer, shooting over his dogs, or following his pack across the country, we see in him a class that does not exist now, and he stands alone in his individuality. Virginia, in the colonial times, was an immense empire in its extent, and was for the greater part a dense wilderness, except along the navigable rivers emptying into Chesapeake Bay; on the banks of these streams were plantations of thousands of acres, thoroughly tilled, which produced a plenteous store of tobacco and wheat, which filled the planter's barns, and being sent to England returned a plethoric supply of yellow guineas that made his income a princely one, and enabled him to keep up his baronial establishment in splendid style.

The history of the "meet" and sporting comprises two distinct epochs—the first comprising a period of some twenty years before the Revolution—1755 to 1776. The manner and ways of the people were all English, and everything they used was brought out from that country. The second period is after the Revolution, and takes in an era of fifty years or more. We find that the manners, modes, and customs are greatly changed, and the people have changed with them. I will endeavor to show up both of these periods so far back, as they are, that a sort of halo of romance overshadows them, and the history of their sporting life cannot fail to be interesting. I will, of course, commence with the first era, and will try and photograph mentally some of the "cocked-hat gentry" and their doings, who, in those days, were intensely loyal to their king, and the dawning idea of a bloody revolution had entered no patriot's brain. Indeed, at the time I write, Patrick Henry was giving his family great concern for his incorrigible laziness, letting his country store take care of itself while he amused himself roaming over the country with his gun and rod, or played the fiddle to an admiring auditory in some cross-roads tavern. Geo. Mason, the father of the first constitution of Virginia, was following Lord Fairfax's hounds. The immortal George W. was also riding hard and fast behind his lordship's dogs, amusing his leisure moments with making love to every pretty maiden he met; and the other historical heroes were pursuing the even tenor of their way, seeking pleasure after their own fashion, and little dreaming what a storm was brewing, and all about a cargo of tea, a beverage which none of them ever drank.

The men of those days well understood what real comfort meant, and though, as the cant phrase goes, "they were heavy on style" and lavished their money freely, yet it was not altogether in vain show. Their houses were but solidly and substantially built; no vast hotel-like mansion ostentatiously roared, and in glaring bad taste, attracted thereon a cheap notoriety. Their grounds were well but simply kept, the out-buildings of good home-made material, the work of the plantation carpenter. Their whole establishment showed wealth, but not apparent display; if they ever went to extremes it was on horses, and many a gentleman found himself ruined by an over-fond love for horseflesh, and an overwhelming belief in his prowess. A Virginia cavalier loved his horse second only to his sweetheart or wife. It is hardly to be denied that these gentry owned famous blooded stock at a time when every planter was an ardent sportsman, whether he "rode to hunt" or "hunted to ride" in that immortal distinction of Asheton Smith's old whip, in those days of English thoroughbreds, of rattling gallops, and desperate breathers. We all know that there were some famous horses in America—imported of course—that for bottom and speed, and rough cross-country work, were incomparable. My own impression is that the Virginia horse, leaving out Diomead's family, was of that called in England the "Destrier," bred from the Andalusian pony and the Arab and Barb, which the Moors had for centuries in Spain.

The term "planter" was originally applied to those who cultivated the tobacco plant, but was afterward given to all who cultivated the lowlands. Everything was profuse on the plantation, and the cost of production was not felt. The planter raised his hogs, who gave him meat throughout the year; his sheep furnished the wool that was spun into cloth and made into clothes by his slaves; his flour and meal were the products of his estate; his cellar was stored with vegetables and cereals; his housewife had her closet filled with potted fruits and pickels, and a dozen or so barrels of apple and peach brandy of his own make was always in the wine dungeon. He had his blacksmith, wheelright, and carpenter, and generally that useful character about the farm called "Jack of all trades," who could turn his hand to anything, and the farmer could, in those days, live like a lord without paying out any money, or worse than all giving his check. This being the case, with his isolation from general society, it is no wonder he was hospitable in the extreme. Nowhere were the wants of stranger guests more regarded, and nowhere was the character of the true gentleman held more sacred. The planter was noted for his open-hearted frankness, and his perfect sincerity. And why should he not be? He does not engage in the rush and turmoil of trade; his mind is not pressed down with business secrets; his better feelings have not been shocked or blunted by the familiarity with the deceits, gulfs, and evasions of the business world; he is as artless and as trusting as a child. The subjoined description, written 150 years ago by Hugh Jones, copied literally from a rare old MS, will show up the character of those hard-ridiug, hard-drinking, fox-hunting communities better than I can picture them. It says:—

"The planters leading easy lives don't much admire labor or any manly exercise, except horse racing and following the hounds, nor any diversion, except cock fighting, in which some greatly delight. This easy way of living and the heat of the summer makes them very lazy, who are then said to be climate struck (we call it now the spring fever). The saddle horses, though not very large, are hardy, strong, and fleet, and can run for miles, showing their great speed and unequalled endurance. The planters are such lovers of riding that they never walk if they can help it; and I have known of many who have spent several hours in the morning in ranging the woods to catch their horses, only to ride two or three miles to the church or the court-house. The "meet" is the place they generally appoint for arranging business matters, for they are more certain of finding there those whom they want to see than at their homes. No people can entertain their friends with better cheer and welcome, and strangers and travelers are here treated in the most free and plentiful manner, so that there are no inns or ordinaries on the road."

In such a country, with such people and habits, it would be heaven to our modern tramp. It would only require a decent suit of clothes and a glib tongue—nothing more—to fare like a king and live like a lord. All the gentry were hard drinkers, all of them "two bottle men." It is no wonder that drunkenness was so prevalent; and then pure old mountain whiskey only cost six shillings a gallon, and the best Jamaica rum, that it would do your heart good to taste, could be bought for nine shillings. In their indoor social customs they were very different from us. While they treated with exaggerated politeness the high-born dames, yet it was not thought wrong to curse before them. A gentleman would help himself to a pinch of snuff out of a jeweled box with stately grace, and at the same time damn his eyes at the end of every sentence. But the civility between men was always observed, for the rapier that hung at the gentleman's left side was a wonderful incentive to courtliness of demeanor; a bitter word, a contemptous gesture—and—a clash of steel; a few feints, the parry, a severe lunge, and a crimson stream spouting from one or both was the result. And so men had to keep a civil tongue in their mouths.

Every gentleman took great pride in his stables and his kennels, and good horses and good hounds were held at an exorbitant price. The keeper of the hounds was the most important functionary on the estate, and his life was a sinecure; he had as many assistants as he chose, and nothing to do except to supervise the kennel. Some of the planters kept a huge pack of hounds, as I shall presently show. Next to the keeper was the head coachman, whose authority over his realm was supreme. He it was who on state occasions drove the great family coach, and held the ribbons over four prancing thoroughbreds; he was usually an old darkey, aristocratic to a degree, and looked down upon the common hands with ineffable scorn. Sitting on his lofty seat, dressed in his crimson and plush livery, with his three-cornered hat surmounting his bushy head, he was a prominent figure, and the object of veneration and envy to every son of Ham on the plantation. The coach was a splendid affair, and was generally drawn by four horses, sometimes with six. A footman and two outriders in livery, one riding before and the other behind, completed the turn-out. The coachman, as I said, was the master of the stables, and he took an intense pride in his horses, whose pedigrees he knew by heart, and to his advice the master always deferred. The kennels formed a separate establishment in themselves; the dogs were fed at regular hours during the day, and often exercised by the master, who trained them for different purposes; some were used entirely to run deer, and were never allowed to run with the fox hounds. It was the duty of the keeper to pick out the best pups, and destroy all such as had any blemish or fault. The kennels were well constructed, thoroughly warm and comfortable; some of them, like Capt. Daniel McCarty's, of Cedar Grove, were ornamentally built, and looked like a pretty Swiss cottage. The kennels were cleaned out twice a day, and perfect neatness was observed. If a planter was known to keep a dirty kennel he lost caste with his brother sportsmen at once. I shall now proceed to give the names of the celebrated sportsmen of the first period, and tell about them all that history and tradition has handed down to us.

Thomas Lord Fairfax, Earl of Cameron, was the autocrat of the chase, and as ardent and determined a sportsman as ever lived. He never was so happy as when with his hounds, or surrounded by a jovial set of sportsmen, narrating their hunting exploits and trying to drink each other under the table. Lord Fairfax was a man of great intellect, an accomplished scholar, and a great literary man. He graduated with high honors at Oxford College; he was a member of the celebrated Kit Kat Club, of London, where all the wise men and wits of the metropolis most congregated, and he was noted for his wildness and dissipation. Of great wealth, high lineage, with the whole world at his feet, as it were, that he should have exiled himself from the gay court at Carlton Place, or the brilliant *salons* of Paris, to spend the rest of his life in the wilds of America, was wonderful indeed; but like everything else in this world good or bad, there was a "woman in the case." He fell desperately in love, and the fair dame not smiling on his suit, he, feeling that life had no further charms for him, and all that sort of thing, in a fit of despair banished himself, and leaving friends and foe behind him, came to the new world in search of excitement and adventure, and not like Ponce de Leon, to find the waters of youth. He gained both, and after all it suited him best. He was a born Bohemian, and loved change and variety, and unquestionably this life of dashing rides and excitiug hunts, brimful of stirring events, suited his martial nature better than the dawdling *nonchalant dilettante* existence of the London lord. His lordship was a dark swarthy man, with eyes as black as sloes and hair of raven hue. He was six feet three inches in height, thick-built, long-limbed, and of prodigious strength. Many tales of personal prowess are told of him. Like all strong men he was good natured to a degree, and he had devoted and staunch friends; his tenants and slaves idolized him, and the women adored him. Surely he ought to have been a happy man, and doubtless was. His lordship, so fond of Diana, the goddess of the chase, was as equally ardent at the shrine of Venus, and the veracious antiquarians relate that the blue blood of the Camerons flows in the veins of many a mountaineer of to-day; however, I know nothing of that. Charles the Secoud, of gracious memory, granted to Lord Fairfax all lands lying between the headwaters of the Potomac and Shenaudoah Rivers and Chesapeake Bay. This vast domain comprised about one-fourth of the present limits of Virginia. It was a kingly gift. The Earl did not oppress his tenants; when in a generous mood, which was very often, he would give away whole farms, and it was a common custom to let his tenants off with their year's rent for some trifle—a wild turkey for his Christmas dinuer, a haunch of venison for his friends, or a huge watermelon for the noonday lunch. He had two residences, one, his mansion proper, was called "Belvoir," situated on Pohick Bay, about three miles from Mount Vernon; the other, "Greenway Court," his hunting-lodge, lay in the valley, thirteen miles from Winchester. Belvoir was a great stately place built fronting the river, and surrounded by a noble group of trees on each side of the mansion, leaving a clear view from the front. On the right, half concealed by the trees, could he seen the "quarters" and shops of the estate, and in the rear was a huge stone barn, with its tin-covered cupola rising high in the air. The house was built of brick brought out from England, and the two wings added on each side were composed of immense oak logs, as solid and massive as grauite itself. A wide and spacious portico ran the whole length of the front that formed a fine promenade, and standing in the porch one could let his eye wander at will, and drink in the whole beauty of the scene; the river winding onward and looking in the far distance like a silver thread in the sunlight; the endless succession of cultivated fields and woodlands—a picture of rare loveliness. Entering the hall into the spacious passage which ran from front to rear, you would see that the walls were covered with trophies of the chase—antlers of the deer, Indian weapons of warfare and the implements of the chase, fishiug rods, guns, rifles, flasks, hunting horns, pictures of celebrated race horses, that had, in their time, won and lost many a fortune; spurs, riding-boots, fencing-foils, rapiers, whips, swords in all the variety of gilt—gold, silver, ivory, aluminum, chiseled and embossed hilts—all mingled together, either hanging on the walls, or lying heaped up on the tables. A broad stairway, as wide as a turnpike gate, led to the upper regions, where the guests' bed-rooms were. On the left was the great dining-room, running the whole length of the house, which was decorated with great good taste; a carved oak wainscot extended from the floor to the ceiling, curiously carved, where quaint faces and grim-looking heads would stare you out of countenance. The fireplace was wide and capacious enough to hold easily half a cord of wood, and the andirons were immense affairs, always kept bright by constant polishing. An old mahogany sideboard filled a large space in the room; it, too, was elaborately carved, and was brilliant with its array of old family silver, gold plate, and fancy cut glass, prominent among which was the old Fairfax drinking-horn, a big silver goblet used only in times of feast and wassail. A dozen decanters, always full, stood outside, and each guest as he arrived was first brought to this sideboard, and drank the health of his host in his own liquor. The walls were ornamented with many pictures, chiefly hunting scenes: A steeple chaser, by Peel; one or two of Herring's hunters; a couple of greyhounds, by Harry Hall. The furniture was heavy and solid, of the kind known as the Louis IV style. The parlor on the left was a formal, quiet place, elegantly and richly furnished. It was always kept close and darkened, except in times of balls and receptions, and then its quiet walls resounded with mirth and laughter. On its walls hung the family portraits, among which was the grandfather of Lord Fairfax, the great Angus Cameron, and his kinsman "Fairlax," the famous general of Cornwall, whose advance in war was like the dash of the thunderbolt. A score or so of haughty patrician dames set off the grim knights in armor.

The kennel was attached to the stable, and contained 150 hounds, one-third of the number being used to hunt deer only. It is said that his lordship knew nearly every hound by name. The leaders of this immense pack were Jupe and old Ringwood, two famous dogs raised by Lord Fairfax himself, and worth their weight in gold. They were fox-hounds, known in those days as the Devonshire hounds, a cross between the English and Scotch breeds, renowned for their bottom and endurance.

The other place of Lord Fairfax, Greenway Court, near Winchester, was a much less pretentious edifice—a long, wide, low building with Dutch gabled roof and small windows, very much such a house at Mount Vernon. There were but 150 slaves on this estate, living in the woods in log cabins. They did hardly any work, for only enough land in and around Greenway Court was cultivated for the wants of the plantation. It was a rough life, indeed, that the owner led here, with no neighbors, and isolated from all humanity except Indians and the poor mountaineers, whose humble cabins he freely visited. He would take long excursions in the wilds, staying sometimes for a week at a time, submitting willingly to every hardship of a hunter's life, subsisting entirely on the flesh he killed. Yet this hard, roving, coarse way of living suited him best, and he spent most of his time at Greenway Court. Sometimes his lordship would return to Belvoir, and the house would speedily be filled with the beauty and fashion of the land, and its rooms crammed to overflowing with the cavaliers and planters, when pleasure and mirth would reign supreme. At Christmas the grand "meet" would take place, and then the hall was in its glory.

I now am going to tell you how they hunted the fox in those days, and the names of some celebrated sportsmen who carried their packs to Belvoir, and made the woods and valleys resound with the deep baying of the hounds and the stirring notes of the hunting horns.

ALEXANDER HUNTER.

[To be continued.]

A REMINISCENCE OF THE RACQUET IN 1853.

A FEW weeks ago in one of the issues of FOREST AND STREAM, I read a reminiscence of Racquet River which brought to my mind, so strongly, my first visit to that stream, that I immediately commenced a search among old journals for an account of my first visit to that then happy hunting ground.

It was on the 16th day of September, 1853, that George F. and the writer left school and home at Glenn's Falls, for a visit to Bill Calkin's, whose log shanty was then situated near the junction of Stony Creek with the Racquet, an unknown land at that time to most people except through Headley's volume. Ah! how little George and I knew of camp life at that time! With each of us a light new sporting rifle, direct from the manufactory at Worcester, how many hours each day, after school, we practiced, trying to rival Natty Bumpo, and then the lists of necessary articles to take with us we made! It makes my back ache now when I think of the Indian carry around the falls. I remember one thing in the Commissary Department we included among the "necessaries" in our verdancy—sweet potatoes! Think of that, ye who have carried a light load around those falls, and you can imagine our greenness. Imagine us starting early that September morning with one of the farm ponies between the shafts of a light lumber wagon, a large dry goods packing box filled with provisions, &c., and all the remaining available space in the wagon box filled with bedding, cooking utensils, &c., the result of a memorandum concocted through many a long consultation. We were both dressed in hunting suits of green broadcloth throughout, and radiant with the exuberance of boyish spirits, we bade our friends "good bye" and reached Root's Inn about 8 o'clock in the evening, eight miles north of Schroon Village, and fifty miles from Glen's Falls. There has been a new route opened since, branching off at Chester, through Minerva, to the Lower Adirondack Works, shortening the distance many miles.

The next morning we took an early start in a rain storm and soon struck the corduroy road. Twelve miles over that old worn out corduroy brought us to the Lower Adirondack Works. I don't know how many times we had to unhitch in the rain, and lead the horse round, and draw the wagon over by hand after partially filling up the holes where the logs had rotted out. I know we thought it was the worst road we had ever interviewed until we were off from it. We had been anticipating getting up a trot after we left the log road, but, delusive hope! We found the mud up to the wagon hubs, and as we floundered on through mud and water, we voted corduroy roads charming. We reached Daniel Bissell's, seven miles beyond the Lower Works, some time after dark and were soon enjoying a good supper and rousing fire. The next morning after breakfast, we pushed on through the rain, the road a complete mud-hole. Hour after hour the old horse floundered on almost as discouraged as the boys behind him. We found one lumber shanty on the road, where we fed the horse and lunched. About 3 o'clock in the afternoon, a road branched off and a piece of board nailed to a tree with an inscription in red chalk, informed us that it was one and a half miles to Long Lake. We turned off, and by dint of a deal of boosting, we helped the old nag up the hill where we found an Irishman named Shaw, located with a house and barn. Here we expected to meet old Bill C., to whom we had written several weeks before according to a previous arrangement. No person could imagine two more forlorn individuals than George and myself after we had unharnessed and fed the horse, and climbed up on Shaw's hay mow to talk it over—both wet through, George with a touch of the asthma, and one of my teeth trying to ache—the nut that held the hammer on my rifle irrevocably lost, with a stock of information from every person we had seen, that in all probability the road would be much worse on our return, although that seemed impossible to us unless the bottom dropped completely out; and to cap the climax, here where we expected to meet Bill and be relieved of all farther trouble, no William was present, and Shaw had informed us that he had no boat, nor knew of any that he could procure, and that he could not spare the time to take us on. Ah! old man, how well you played it on us. I verily believe that but for the dread of the scoffs and jeers of our school mates at home, we should have then and there taken the back track out.

We finally interviewed Shaw again, and after *doubling** our persuasion induced him to think, that he might perhaps, procure a boat and take us on next day. While Shaw was absent for the boat, the rain ceased. The clouds began to break away, and we strolled up the hill to get a view of the lake. Just as we reached the brow of the hill, the sun burst forth in all its glory, and Long Lake in all its autumual beauty lay spread out below us. What a magnificent scene that was, and in the reaction from the gloom of the past two days to the glory of that sunset, we shouted and danced like a pair of lunatics, and if our spirits were at zero as we went up the hill, they were at least 100 degrees above as we came down and found that Shaw had procured a boat, of which we have since surmised he may have been sole proprietor. All dirt and discomfort in accomodations were overlooked in the anticipations of the morrow.

The next morning was bright and beautiful. By 8 o'clock we had carted our traps to the lake, and were ready to embark. the boat was a flat bottomed lumberman's skiff, and loaded to the water's edge. At that time there was a shanty oposite Shaw's, and one near the outlet, occupied by a bachelor named Brown. With what anxious eyes we scanned every rod of the shore to see our first deer! We arrived at the carry, at the head of the falls, a little after noon. I cannot do justice to our experience in getting across; suffice it to say we embarked at the foot of the falls just at sunset, leaving our packing box of provisions and various heavy articles, at the head of the falls, to be brought across at some future day. On down the river we glided in the darkness, Shaw, as well as ourselves, in perfect ignorance as to the whereabouts of Bill's shanty, only knowing it was some miles below the falls. We made the woods ring with our shouts, for fear that we and Shaw might pass unnoticed in the darkness, and what a relief we felt, as a light popped into view, through four panes of 7x9 glass, and two minutes after we were grasping, not exactly the hand of Providence, but next to it in point of size, the hand of old Bill C. Ah! What happy days and glorious sport we had for the next two weeks! Deer were plenty, and partridges innumerable; trout were spawning, and there was a spawning bed just above the shanty; but we only took two or three occasionally, to keep our hand in, and for a change in our bill of fare. It was hard work to restrain ourselves at that age but Bill dilated so strongly about distroying game for the fun of it, that we listened kindly*.

We only saw two persons during the two weeks we were there, and they came in from Martin's to see about a lumber job; and brought in the letter we had mailed to Bill some weeks before we started. The postal facilities at that time were not very complete, and Bill had but few neighbors. Bill's shanty was a log house, of one room, just below where Stony Creek empties into the Racquet. Bowen, at the Long Lake outlet, was the nearest neighbor up the river. There was a shanty sixteen miles below, and two families on the carrying places between Bill's and and Martin's, at Harriettstown. Hardly a day passed without our seeing deer.

We camped at Racquet Falls, on our return, (where I understand there is now a hotel and baggage express). No one checked baggage there then, but there was a lot of smashing done.

We left Bill's, after dinner, September 27th, on our return, with our *impedimenta* that we had brought from home, greatly reduced in bulk and weight, but each of us had a "big buck," that we were bound to take to Glen's Falls, under any and all circumstances. We carried the boat and deer over the carry during the afternoon, and came back to the foot of the falls to spend the night, Bill, having come so far with us, to enable us to get an early start in the morning. There was a remnant of an old camp there, and while Bill repaired the covering, and I gathered boughs for bedding, George, stepping out on the boulder, captured five or six trout from the river. We soon had everything fixed for the night, our supper disposed of, and our wearied limbs stretched towards the roaring, crackling fire. We were lapsing into forgetfulness, when Bill, suddenly said, "Hark! the wolves!" George and I were instantly on our feet, listening with erect ears; the moon was shining brightly, and not a sound could be heard but the monotonous roar of the falls. Presently there arose such a prolonged fearful howl, that one lad's hat that I know of, was raised at least three inches above its ordinary location. Three times the wolves commenced low and tremulous, and as one after another joined in, swelling the sound, it was fearful in the stillness. Each time as they ceased, a screech owl, in the spruce overhead, sent forth his hooting shriek for a doxology. Bill said: "They were holding town meeting, and it would rain before morning." And Bill was right. It is hard for me to realize that one would now be more apt to hear the sunny laughter of a maiden's voice, or the notes of a piano, than the howl of a wolf, at the Indian Carry, and that the shooting of a deer is now the grand exception of a hunt on the Racquet, and that when you fish for trout you catch a pickerel. But over twenty years have passed away, and Bill C. has gone to his long home, but his kindness and eccentricities will long be remembered, by the two boys that shot at their first deer on the Racquet in the fall of 1853.

FRITZ.

*NOTE.—The editor puts down two white marks to the credit of Bill.

*NOTE BY THE EDITOR.—Poor human Nature was the same in 1853 that it is in 1876.

For Forest and Stream.

HUNTING IN WEST VIRGINIA.

LIVING, as I do, in the backwoods of West Virginia, cut off from the pleasures that most gentlemen enjoy who have the constant change that city life affords, I have to seek my pleasure with the rod and gun, and as the country in which I live affords all the sports that one could desire, I have thought that a description would be entertaining to some of your many readers, and bring some of them to a new field to enjoy the pleasures that afford me recreation and game.

These springs are situated in Morgan county, 110 miles from Baltimore, on the Baltimore and Ohio Railroad, in one of the wildest and most primitive countries east of the Rocky Mountains. During the summer season they are the resort of five or six hundred visitors, who come for the purpose of enjoying the baths and healthy mountain air. The hunting is of greater variety than at any other place I have ever been, consisting of bears, deers, turkeys, pheasants, ruffed grouse, woodcock, squirrel, and other game, or "varmints," as the natives call such animals as coons, foxes, and wild cats. Our streams are the Potomac River, Cacapon River, Sleepy Creek, and Back Creek, all of them well stocked with the black bass, affording fine sport to those who are fond of fishing. I have seen some taken that will kick the beam at six pounds, but they run from one to four pounds most frequently. The catch has not been large this spring, on account of the muddy condition of the waters, caused by heavy rains. We anticipate fine sport when it clears up. In the *Turf, Field and Farm* of August 13th, 1875, you will see an editorial headed "Happy Hunting Grounds in Virginia," giving a description of one season's hunt by my father (Mr. Dudon) and myself, which I refer you to, or to Mr. Skinner, who wrote it, and had

hunted on these grounds. Since 1875 my hunting has only been when I could spare a day or so from my work, and the bag has not been as large as it was in that year, although I manage to get two or three deer and fifteen or twenty turkeys a season, with sufficient quantities of ruffed grouse and smaller game to keep me in fresh meat. This year there will be more turkeys and ruffed grouse than there has been for years; the last winter was unusually mild and free from snow, and the early spring was very favorable for hatching, and I now hear three old cock quail whistling, as I write this, within the corporate limits of the village. Our seasons for hunting are squirrels now, woodcock after the 4th of July, and all other game after the 15th of August. Last year, in the month of October, Mr Hamilton Easter, of Baltimore, with his son-in-law, Mr. Waters, spent three or four days near here hunting. They killed nine deer, and some pheasants and turkeys, and, although he is well advanced in years, I understand he intends to spend several weeks every year hunting in this country.

Last August I was on the survey for the extension of the Chesapeake and Ohio Canal, and, having a day of leisure, Col. Sedgwick, Mr. Rawlins, and myself started for a turkey hunt. After keeping with them for some time, I found they made too much noise for me, so I left them and started to the top of Hoblcy Mountain. When I got to the top I saw fresh scratching made by the turkeys, and anticipated fine sport. I fixed myself comfortably, and took our my caller to see if I could get any of the young ones to answer—a difficult thing to do unless you have first scattered them. I suppose I had been calling for some ten or fifteen minutes when my attention was attracted by a rustling in the leaves just below me. Looking in that direction, I saw some large animal slowly approaching me through the weeds, and supposed it was a wild cat, but on its coming closer I found it was a panther with a chicken in its mouth. It came within thirty or forty yards of me and stopped, having got wind of my tracks, as it was then where I had gone along. It stopped and looked in every direction, not knowing which way to turn, but at last started towards me and came within twenty yards, when I determined to see if I could kill her with No. 5 shot. I fired, aiming just behind the ear. She dropped, sinking her teeth through the back of the chicken. I immediately started towards her, to give her the other barrel if she should recover. As she saw me she commenced to growl, which caused me to give her the other barrel at ten steps, which finished her. On examining her, I found she was a two year old panther, measuring five and a half feet in length, and some sixty pounds in weight. She was taking the chicken to her young ones, I judged, from the appearance of her teats having weaned them. She was very thin I have the skin, and it will make a beautiful rug—a beautiful brown, with black spots.

The deer, turkey, and ruffed grouse hunting will be fine here this fall, in October and until the 15th of January, and I anticipate fine sport. If any of your readers wish to try this country let them rent two or three wall tents, buy what stores they wish, and come here to spend a month or six weeks, and I will predict they will go back with more health and game, and with less that is disagreeable, than from any other hunting country I ever hunted in.

P. CLAYTON.

Berkley Springs, W. Va., June 8th, 1876.

NOTES OF THE WHEELER EXPEDITION.

A DAY IN THE FOREST. NO. 1.

"Now, my co-mates and brothers in exile,
Hath not old custom made this life more sweet
Than that of painted pomp? Are not these woods
More free from peril than the envious court?"
—*As You Like It.*

WITH all of their grandeur and majesty the mountains of California are sadly deficient in one regard—they lack those minute dots of red and black coloring which are given by the wild plum and grape, the service-berry, and wild cherry, which Nature is wont to hide in out-of-the-way places for the delectation of her favorites, the foresters. To be sure, there is scenery to look at, but one grows dazed by the vivid stripes of the broken ledge, and indifferent to the contrast between the gaudy sandstones and the black-green of the pinery, and longs again to see a meadow with buttercups and bull's eyes. I remember a ten acre field on the old homestead, with raspberry bushes in the fence corners and huckleberries on the ridges, which I would rather see to-day than a Yosemite or Niagara of natural scenery. Besides, there is but one time in a man's life when he is a fit subject to be impressed by the beauties of nature, and that is when he has a ticket, excursion rates, for himself and sweetheart down the lake.

We fall to musing.

"Whipple, when did we see our last woman?"

"Such events are epochs not to be forgotten," replies Whipple, who is a famous ladies' man. "It was the pretty Indian girl to whom I gave my old boots. They struck us about three weeks ago. She was with the fellow who drank up all our whiskey. Perhaps you remember the occurrence now."

"We shall never forget it," is replied in grim chorus.

It is the chief amenity of the woodman's life, this hospitality of the wood, which places in his path an occasional patch, crimson with fruit or brown with nuts, but these forests are inhospitable to the meanest degree, and never yet have we found within their borders a single nut, berry, fruit, or other thing which might afford us nourishment or refreshment except the *pinone*, or pine nuts, the time of whose ripening is a holyday in the Indian's life.

Of game, however, there is abundance, and hunting, either for sport or profit, is very successful. There are birds in the air for the shot gun, beasts in the bush for the rifle, and trout in the pool for the line. Of bears there are the grizzly, cinnamon and black. Here the renowned grizzly, finding in his range no berries on which to feed, becomes strictly carnivorous and kills the settlers' cows, and, by way of relish, once in a while a man. His track, strangely human in shape, with heel, toes, and instep all plainly marked in the dust, is everywhere, and it is no joke to follow such fresh signs down into a wooded rocky cañon. Once we saw his trail on the highway, which was a turnpike accurately engineered and nicely graded, over which families were returning from church, and ladies were riding horseback and alone. To such novelties and vicissitudes are our pioneers exposed.

The mountain lion, or cougar, is vicious, but not strong, and he is capable of no more serious mischief than to carry off such important prey as colts, calves, and small children. His cry is heard on every hand from dusk to dawn. In a note that is half yelp and half mew these creatures give calls and answers to each other like so many watchmen walking the walls of a city, or sentinels stationed along the valley. As the flame of the fire crackles up these grow fainter in the distance, and as it dies away the beast's curiosity gets the better of his fear, and his bark sounds startlingly near. Then some timorous member of the party observes that the night is very chilly, and shying up to the embers he provokes them into a blaze with an additional branch; for it has been noticed that a good fire is the best security against the mountain lion, as against many other wild animals.

The mountain ram, with white buttocks and spiral horns, leads his convoy along paths which would turn the head of a chamois. Then there are deer in the chaparal, antelopes on the plains, squirrels in the trees, and hares on the desert. Now, the hare is divided into two species, the cotton-tail and the jack. As an article of food, however, the latter is not worth the labor of chewing, for his muscles are tough and stringy, and on account of the long and vigorous jumps for which he is celebrated, the flesh of his legs, and he is little else but legs, becomes very grisly and hard to masticate.

The cotton tails are better, being sweet and juicy, and, what is of importance also, are numerous and easy to kill. Every clump of sage-bush has its cotton-tailed denizen, and it is no trouble and no glory to go out and kill a dozen. But the funniest and tiniest of all animal kind is the cotton-tail squirrel, too small for a mouthful, which, furling his ornamental tuft over his head's antipodes, scampers fussily across the road, looking very much like a miniature blockade runner with a bale of cotton on his quarter deck. It is no matter how cross and disagreeable you may feel, the apparition of one of these quadrupedal minims is sure to put you in good humor, for when it crosses your path it is as if a ludicrous thought flitted through your brain.

There are quails in myriads clucking on the ground and whirring through the air. Some are bare-headed and small. Once we camped under oak trees, where they came regularly at night to lodge in flocks of thousands, as pigeons come to their roosting place. Then the branches above us were as full and as noisy as a Chinese lodging house. A discharge of shot at random would have certainly brought down its pot-luck victims, but that were inglorious hunting, and so we refrained. Not that all our hunting has been glorious, for there stands against us the case of Smith, the packer, who brought in the first game of the season. This he bagged, not in a fair and above ground manner, but by sitting at the mouth of its burrow for three mortal hours, unswerving as fate, patient as a box-trap. Then the cotton-tail appeared and Smith gathered it in. Though we rejoiced and applauded at the time, for we were hungry, and cotton tails make very good eating, yet in the bottom of our hearts we have never ceased to deplore this action, which was nothing less than bloody murder.

Still, the deer on the hills are of little more use to us gastronomically than those in the park are to the hungry gamin who stones them through the fence. The members of these parties are not hunters, but scientists and surveyors. They do not travel by stealth and alone, but together and with all of the dust and turmoil of a pack train. They are too much laden down with instruments and apparatus to carry much of a sporting outfit. He who comes here with intentions of great slaughter, and shot gun of double barrel, soon discards the toy as an incumbrance and a bother. Besides, it is noticeable that they who move constantly within range of game which is too utterly natural and fearless to fly, soon lose in a great measure the instinct of the hunter, and are moved no more by a herd of antelopes than by a drove of cattle.

Except by an occasional naturalist and collector there is little venison brought in. It seems to come so easy for those gentlemen of the natural history corps to do good hunting. When they see a fat buck they only say, "Ah, a very fine specimen! I must secure it!" and so they do. You see the spirit of the collector is always with them, and what of their collections is not good for science is often very good to eat. And then they are so acquainted with woodland life, and the likes and dislikes, habits and fears of the animals, and are so deep in the confidence of nature in general that they seem to belong to the forest, and to be fellows with its denizens, like the capriped satyrs, and the creature which is one moment their companion, the next becomes their victim.

Among all of the ranges and professions of men no other makes so good a companion as a naturalist. It is a fallacy that this is a dry and uninteresting class of people. The lawyer, the merchant, and, once in a while, the clergyman, may be dry, but never the naturalist and medical man. They deal too much with life and flesh and tissue, and with organic matter in all of its shapes to ever become reduced to that parchment-and skeleton existence which characterizes those who vamp up the shapeless thoughts of Aristotle and Blackstone. They may use big words in lecture, book, and report, but it is perforce and unwillingly. There was our professor at college, for instance. Out of words as long as Alexandrine verses he wrote treatises over which students grew pale and died. Yet he had his little humor, and it would out—that is when was not on his guard. Standing, one day, before a chart of those marvellous creatures restored by Waterhouse Hawkins, he forgot himself and inadvertently composed this little quatrain, which has never before appeared in print:—

"How doth the martial brachtopod
Ascend his aniry ear,
And care the long-heeled macropod
To show himself his peer!"

It is quite needless to say that this display of human weakness by the professor lowered him in his self-esteem as much as it lifted him in the estimation of his pupils.

In spite of certain little technicalities of speech which may seem like pedantry, the naturalist is still a jolly and sociable companion, who very seldom mounts the pedestal of his dignity, who can beguile the camp fire coterie with a good story when his turn comes, and who can make the march interesting by opening the thousand and one little mysteries of nature which seem so wonderful to the outsider. If you are about to take a tramp in the woods, my city friend, choose one of these for companion and guide. A week with him will do you more good than a term at college. He will show you the wonderful masonry of the swallow's nest, the tunnel of the mole, and the labyrinthine crypts of the ant-hill, and, observing the regular shaft of the honey-cell and the concentric circles of the spider's webs, he will prove that "Nature geometrizeth, and observeth order in all things."

So goes the day in the forest. At evening, after dinner, there is contention in camp, and a strife for the only bit of reading matter in our outfit. It is a badly banged pamphlet copy of "Middlemarch," pilfered by our literary pirate from the dusty mantel of a stage station which once lay in our route, at which it had been forgotten by some passenger of more esthetic tastes than the ordinary rider on these roads. It was manna to our hungry minds, for it came to us when a stray leaf from the Book of Chronicles would have been a luxury. When tired of the conversation of our own narrow *camaraderie*, whose jokes have grown a trifle stale after six months of repetition, we can now turn to "Middlemarch" and open the book where Mrs. Cadwallader is speaking, and we seem to hear the pat remarks of that exceedingly sharp woman. Or we listen to the rounded flights of that uneasy genius, Will Ladislaw; or the genial humor of Borthrop Trumbull, auctioneer; or the precise priggishness of Mr. Casaubon; or the sparkle of plain little Mary Garth. Or, wishing for sublimer thoughts, we con and learn by heart those head lines which the author has prefixed to her chapters, and which fit to the coming events as appropriately as a prologue to a play. Where did George Eliot find all of these wisdom bits of literature, we wonder, and did she scour her memory for them purposely to introduce her chapters, or did she adapt her own writing to them, as sermons to texts, as Longfellow used to do in some of his earlier prose? We trust and believe not the latter, for it is the charlatanry of literature, by which writers would fain make readers believe that they have the world's wisdom at tongue's end.

It is a very nice thing to be able to steal away from the circle of rude men and feel at home in the halls of the Chettams and the Brookes, and in the cottage of the Garths. Out here in the wickedness of this new country we wonder if ever unfledged angel was as good as Dorothea, or whether the novelist is imposing on our credulity. Celia also would have been a most lovable character if she had not made such a fool of herself over her baby; that is a great fault in woman. Rosamond Vincy, too, had her charming spells, but we think that if we had been her husband, Lydgate, we would have handcuffed her in one of those fits of her obstinacy. But Dorothea, dear, devoted Dodo; she was the girl altogether lovely; of such are they who smell tobacco smoke in their husband's moustaches and never complain. Perhaps there are Dorotheas yet remaining in real life and spinsterhood, to be had for the finding and wooing, who knows? But then there are Rosamonds, also, and marriage is the only means of divination whereby a fellow can discover which is which. On the whole it is perhaps well for a young man to avoid these games of chance.

Thus we reason, perhaps crudely, as we read "Middlemarch," stealing the book, begging it, buying, gambling for it one with another. By the flicker of the fire or the restless spark of the unsheltered candle we follow the thread of the story, and in the morning, before the march, we glance at random between the covers to find one of George Eliot's great thoughts, upon which to ruminate through the day. Such is the distant empire of this lady author, who, the subject of a queen, is yet a greater sovereign than she.

FRANK CARPENTER.

The Wheeler Exploring Expedition, California, 1875.

Fish Culture.

ABSTRACT OF THE REPORT OF THE NEW HAMPSHIRE FISH COMMISSIONERS.

The Commissioners in presenting their annual report congratulate themselves and the people generally upon the increasing popularity of scientific fish culture, and upon the fact of its being of recognized advantage and importance, the result of which is to open still wider the road to success. They say:—

"Thousands of dollars now going out of the State could be kept at home, food now a luxury be placed within the reach of all, and numerous other advantages secured, in restoring, partially at least, the abundant supply of fish our lakes and streams formerly afforded. The tales of the abundance and variety of the fish that frequented the Merrimack and its tributaries, in the early history of our State, sound like mythsome legends in this present time of scarcity; and should science in the future in some degree succeed in restoring the past abundance, it will be a consummation well worthy being proud of. To accomplish this end the hearty co-operation of all is necessary, both in furthering the progress of restocking, and in seeing to it, if once restocked, that the abuses which have destroyed our fisheries in the past shall not be repeated in the future. By the transfer of mature fish, and the artificial propagation from the spawn, we may succeed in so stocking our waters that a return of the old time abundance is possible and probable; but without the protection which every man should feel bound to exercise toward an object so clearly tending to universal advantage, it is only too likely that the labors of the commission will be rendered unavailing."

Of the various fish native to and introduced in the waters of New Hampshire, the Commissioners speak as follows:—

WALL-EYED PIKE.—This fish spawns in April or May, and when it finds a satisfactory home multiplies even more rapidly than black bass. The Commissioners are pleased to be able to report that in the past year they have achieved an entire success in introducing wall-eyed pike into New Hampshire waters. In May, fish were produced from Auburn, Lake Champlain, and Sunapee lake, probably the waters most suitable to successful fish propagation in our State, stocked therewith. Later in the season, Lake Massabesic was stocked with mature fish from the same place. Several other waters of the State should be stocked with this excellent fish, and, with proper protection and ordinary good fortune, in a few years the stocking of New Hampshire waters with wall-eyed pike will be an accomplished fact.

BLACK BASS.—Excellent progress has been made in stocking our waters with black bass. Continued trial proves them well worthy their reputation of being the best or one of the best fish with which to re-stock depleted waters. They thrive and multiply wonderfully, and in waters whose close time has expired, good bass fishing is now easily ob-

tainable. They were first introduced in New Hampshire in 1864 or 1865, and up to the present time, over forty lakes, ponds, and streams have been stocked with them.

A number of the waters stocked in previous years have been examined by the Commissioners during the past season, and the bass found to be doing well, and greatly multiplied where the character of the waters was such as to furnish them plenty of food. This would seem to be the great desideratum of waters to be stocked with bass, and such is shown to be the case by the fact that in ponds where the supply of food has been scanty, they have remained more nearly stationary, both as to numbers and size. For the successful propagation of bass, waters with rocky or gravelly bottoms are necessary, and it is but time and labor wasted to stock waters having muddy bottoms. They have done fairly in Massahesic, and afford fair fishing there; but Lake Sunapee bears away the palm, its waters literally teeming with bass, and affording splendid sport to the angler. As a hint toward their wonderful increase and abundance there, it may be stated that, stocked in 1868, in the season of 1875 it is estimated that three tons of black bass were taken from the lake.

Blaisdell's pond, in Sutton, was also examined in September, and a large number of young bass observed, probably hatched in 1875. This pond is raised by a dam, and in certain seasons of the year, on account of scarcity of water, is drawn off to supply water below. It is thus drawn off six or eight feet in the course of the season, and during last season black bass were found in the brook which flows from the pond, going to show that black bass are not quite as non-migratory and stationary as has been generally believed, but under certain circumstances will "leave the home of their birth."

During 1875, ten ponds, and various other waters have been stocked with fish from Lake Champlain and Sunapee. Now that so abundant and easily accessible a home supply of adult fish is provided at Lake Sunapee, the Commissioners expect to carry on the good work in the future with increased vigor and success.

Brook Trout.—The Commissioners deplore the fact that brook trout are decreasing in numbers in the State, and that though New Hampshire was once the spot par excellence for trout fishing, it is at the present time difficult to secure a satisfactory day's sport except in the most wild and uninhabited districts. The report says:—

The causes of this depletion of our waters are various, the principal of which, however, is, first, the cutting off of timber, by which the streams are exposed to the direct rays of the sun, the streams lessened in depth, and in some cases entirely dried up, and a great decrease in food for trout, occasioned, as much of it is, by insects which fall from the foliage overhanging the streams; secondly, the pollution of streams by the sawdust from saw-mills, tan from tanneries, and the like; and lastly, and perhaps chiefly, from continued and persistent over-fishing. The first cause is entirely, and the second to some extent, beyond the power of legislation to rectify; but assuredly, proper legislation, combined with systematic and general efforts in re-stocking depleted streams, would do much to better the condition of our trout fishing.

The remedy recommended is re-stocking by individuals or communities, to be carried out with spirit and determination.

Salmon.—The agreement made by the chairman of the commission with the other New England Fish Commissioners, in regard to stocking the head-waters of the Merrimack, was carried out. About 250,000 young fish were received from Fish Commissioner Brackett, of Massachusetts; 230,000 were put in the Pemigewasset by Commissioner Wadleigh; the remainder were received by Commissioner Noyes, and set free in the head-waters of the Contoocook.

California Salmon.—Two lots of California salmon have been received by the Commissioners, amounting in all to about 40,000. A portion of these were introduced into the head waters of the Contoocook, the remainder being placed in the Pemigewasset in Warren.

This salmon closely resembles our native salmon, but differs in some particulars. It is in every way a desirable fish, and its successful propagation here is to be hoped for.

Fishways.—The reports of fishways are, for the most part, encouraging, but a trial of a year or two will be required fully to test their practical efficiency. The Commissioners have examined the way at Lawrence, and think very favorably of the improvements made. The fishway at Manchester, over the Amoskeag falls, is excellent, and if practicable ways are constructed over the dams on the lower part of the river, no fears need be entertained as to the effectiveness of this one.

The great obstacle met in the construction of fishways, and hardly overcome by any of the styles at present in use, is the difficulty of rendering them likely to be found and entered by fish. No considerable obstacles are now left on the Merrimack in New Hampshire, and if Massachusetts succeeds in her endeavors, the ultimate success of the re-stocking the Merrimack with salmon may be anticipated.

—For a month past large numbers of shad have been taken from spawn in the Susquehanna. The work has been progressing under the direction of Professors Baird and Milner, United States Fish Commissioners. The work as in charge of Albert D. Hayes who has eleven men employed in catching and spawning the shad at night. The spawn of a female shad is pressed into a pan and is impregnated with the milt of the male fish. About 20,000 eggs is the yield from a full grown female, and the milt from one healthy male will impregnate three times this number. The spawn is then placed in hatching-boxes, anchored in the stream, and with the water at its present temperature, 32 degrees, the hatching follows in three days. The young fish is born with an umbilical bag attached, which supplies its food until the bag disappears, after which time its means of existence is unknown, as no food has been discovered which the young fish will eat. As soon as possible after this bag disappears the fish are placed in cans, each holding about 20,000, and shipped immediately. From this point they have been sent to every southern State except Texas and Arkansas.—*Germantown Telegraph, June 23.*

Important.—Care should be taken, in buying Fishing or Hunting Soit to get a genuine Holabird Suit, and not one of the worthless imitations which are being put on the market. The best is the cheapest.—Adv.

Natural History.

BIRDS OF CENTRAL NEW YORK.

[*Continued from page 284.*]

Pinicola enucleator. Pine grosbeak. An irregular winter visitor.

Carpodacus purpureus. Purple finch. An abundant summer resident, arriving the second week in April and departing in October.

Ægiothus linaria. Red-poll linnet. Irregular in winter.

Chrysomitris tristis. Yellow-bird; gold finch. Abundant and resident, but less common in winter. It breeds in June.

Plectrophanes nivalis. Snow bunting. Abundant from November to March.

Poœcetes gramineus. An abundant summer resident, arriving the first week in April, and departing in October.

Melospiza melodia. Song-sparrow. An abundant summer sojourner, arriving the first week in March and departing in November.

Junco hyemalis. Snow-bird. These birds are tolerably common in autumn and spring, but winter south of here.

Spizella monticola. Tree sparrow. Common in the spring.

Spizella socialis. Chipping sparrow. A common summer resident, coming about the middle of April. It breeds in all the gardens, and disappears early in October.

Pyrgita domestica. English sparrow. Resident and abundant in the large towns where it breeds in boxes.

Goniaphea ludoviciana. Rose-breasted grosbeak. A summer resident, arriving the first week in May. It breeds and departs southward in September.

Cyanospiza cyanea. Indigo-bird. Common summer resident after May 1st; breeds, and leaves us in October.

Dolichonyx oryzivorus. Bobolink. Very abundant between the second week of May and the middle of August.

Molothrus pecoris. Cow-bird. Anudant in the spring, and a few remain all the year.

Agelaus phœniceus. Red-winged black-bird. Arrives the first week in March; breeds abundantly, and departs in November.

Sturnella magna. Meadow lark. Abundant in summer, and a few remain through the winter.

Icterus spurius. Orchard oriole. Rare in summer.

Icterus Baltimore. Baltimore oriole. Abundant from the middle of May until September.

Scolecophagus ferrugineus. Rusty grackle. Arrives the first week in April, and passes north to breed, whence it returns in September on its southern migration.

Quiscalus purpureus. Crow black-bird. Common summer resident associating with the above. Arrives the second week in March. H. G. Fowler.

STICKS IN A DEER'S BODY.

Philadelphia, June 17th, 1876.

Editor Forest and Stream:—

An incident mentioned by one of your correspondents, viz., killing a doe with a stick imbedded in the body and healed over, is curious but not isolated. Some years ago I was camped at Catlin Lake in the Adirondacks, Mr. T. Elwood Zell and another friend being with me. Caleb Chase ran in a deer one morning which Mr. Zell killed with a pistol. We were rather astonished at the short run the deer had made, as it no sooner jumped than it took right down hill to the water; but upon opening it we found a hemlock or spruce knot some inches long which had gone in at the breast, and lay along inside the ribs, and at right angles to them. It was grown over and covered so as to look like a bone at first sight. This accounted for the animal's inability to run much. The deer was a barren doe, and to my recollection—and that goes over a good many feasts on that kind of meat—the most delightful piece of venison I ever ate. We inferred that the deer had snagged itself in jumping a fallen tree. One of your correspondents, I see, gives Florence Heights, N. J., as the southern limit of of the Rhododendron, but can hardly have thought when he said so unless he does not really know. The common *Rhododendron maximum* grows all through the mountain regions of Virginia and West Virginia, and to my recollection is quite plentiful in western North Carolina among the mountains there. The *Rhododendron catawbiensis*, a variety not so large and bearing a different colored blossom, grows even further south. In the same number of your paper is a letter describing Mountain Lake, Va., wherein the writer of the article says "Masses of rhododendron sweep down to the water's edge all around, whose wealth of bloom is surpassingly splendid." I can vouch for that statement for I have been to the lake—formerly called the Salt Pond, and a beautiful place it is. The view from the high knob of the Salt Pond mountain is exceptionally fine and worth a trip from this city to see. Any man who has crawled through as many thickets of rhododendron in the mountain region of Virginia and West Virginia as I have, will be glad enough to have the southern limit established at Florence Heights if only the limits can be enforced. The Virginians call it laurel, and it is discouraging after crawling an hour through a thicket, to go up a stub and looking out see nothing but laurel as far as the eye can reach. The mountain laurel (*Kulmia*) the Virginians call "ivy." C. C.

Flies on the Potomac.—The *Ephemeridæ*, May flies, usually make their appearance about the middle of May in immense numbers along the Potomac River. This season the shad-fly (*Palingenia bilineata* Say.) was to be seen in clouds between May 15th and 23d, covering docks, boats, bridges, and even the sides of the railroad cars as they crossed the bridge, or moved in the vicinity of the river. Attracted by the light of cabin windows, they covered the sash and panes and gathered on the deck, until to step upon the spots where they were thickest was to "put your foot in it" in a way that was very unpleasant. The furnace doors of the seine-engines were an irresistible attraction, and they poured into them in a steady stream for hours. Their frail wings were usually singed before they reached the fire, and they fell into the grate in front, and had to be shovelled out from time to time, as they interfered with the draught of the furnace.—J. W. M.

Giant Pear Trees.—In Forest and Stream for June 8th mention is made of some large pear trees in the town of Elcaria, Texas, supposed to have been planted long ago by the Spaniards, who at a very early period first settled this portion of the Rio Grande Valley country. It is doubtful, however, whether these trees are really among the largest pear trees in the world. If the reader will turn to page 360 of the Geological Survey of Indiana, 1873 (Prof. E. T. Cox), he may read of a pear tree near the town of Vincennes, Knox county, Ind., which was nearly twice the size of the largest of the Elcaria specimens. A pear tree on the Ochiltree farm, now owned by Wm. Wise, Esq., has become historical. The Rev. H. W. Beecher visited this tree many years ago, then in the full vigor of its fruitfulness, and published an interesting and graphic account of this "giant of its race." The great pear tree was 12 feet in circumference near its base, 120 feet high, with a lateral spread of 60 feet from the trunk, and bore an average crop of fifty bushels. Riven by lightning it survives on in history and tradition, after a life of nearly three score years and ten. In the same neighborhood, in the orchard planted by Col. Vigo, of Revolutionary fame, are apple trees which measure from two to four feet in diameter; they still survive in good bearing. This, however, is in a portion of the country famed for the splendid growth of the trees, whether native or cultivated, due in part to the genial climate, but mainly to the almost incredible depth and richness of the alluvial soil. The remnant of the original forest still contains sycamores of ten, twelve, and even thirteen feet diameter; tulip trees seven to twelve; cottonwoods, eight; black walnuts, six to eight; pecan trees, six to eight; catalpas, three to four and a half; and even sassafras trees four feet in diameter These same trees are remarkable for their height, however, more than for their diameter, the heavier forest averaging over 100 feet in elevation; the first three species reach 180 feet, while a sassafras of 95 and a persimmon of 115 feet were measured!—R. Ridgway.

—Our New Haven friend, Mr. Robert Morris, sends us a seasonable letter in defense of the robin against unthinking and unfeeling persecution, which we commend to our readers' attention to-day.

—In addition to the interesting reports of the Challenger cruise given in *Nature* for June, Dr. Wyville Thomson will lose no time in putting before the public his account of the scientific results of the expedition. Two volumes, containing the results of the dredging of the Atlantic, and fully illustrated from Mr. Wihl's drawings, will be published in the autumn by Macmillan & Co., to be followed by two others, in which will be recorded the discoveries made in the Pacific and Southern Seas.

—There was lately found on the banks of the Isis River, England, a dead grebe which had been choked in attempting to swallow a "miller's thumb" (*Cottus gobio*). This fish has little spine-like processes on the side of the head which had stuck in the bird's throat, and choked the windpipe. There is a case on record where a poor fisherman was killed by another species of *Cottus*, in attempting to bite off its head. The fish, however, gave a struggle and slipped down his throat and expanding his spines at the side of the head, managed to immovably fix itself in the larynx, thus killing the man by suffocation.

A PLEA FOR THE ROBIN.

New Haven, Conn., June 20th.

Editor Forest and Stream:—

Farmers and gardeners who are not inclined to enquire into the habits of our birds, see in the robin only a bonny bird in the spring, which later becomes a frequent and destructive visitor to the cherry tree and strawberry patch, and pass in adverse judgment upon him accordingly. That this is at least an *ex parte* decision, I wish to show, and thus enter a plea for a maligned bird.

The robin's proper food is insects; scarcely anything else. No bird has a more varied diet of insects, and none a greater capacity, in fact the robin is always hungry, and is always gad-fying his hunger with just such insects as cause the most trouble to farmers. He is up latest in the evening and earliest in the morning, so that the cut-worms, and other insects which hide in the ground during the day, and only make their appearance at night, fall a prey to this bird, whose greatest pleasure is to do good. No other bird is so fond of apple-borers and the larvæ of insects in general; when a colony of the nest worms which strip the leaves from the apple trees, is discovered by a robin, the nest is regularly visited until not a worm remains, and you may often find a nest deserted as you suppose by the worms, but had you watched the process of desertion, the remarkably rapid growth of the young robins in the neighbouring tree could have been more easily accounted for. Robins are continually searching for insects and the another destroyed by them is almost incredible. If a person will post himself near a nest of young robins he will see the old birds bringing insects to their young, literally every minute; and all day long. In the season for small fruits only one cherry or strawberry, for from five to ten insects will be brought to the nest; this remark is made from actual observation in a locality where the above fruits were in abundance. Where robins are common, of course, they trouble fruit growers considerably, as they select the choicest portion for themselves and bite into much fruit which they do not carry off; but a few blank charges fired at them while in the act of eating fruit, or a stuffed hawk placed in a conspicuous place, will effectually frighten them away. As the season for the cherries or strawberries lasts only a few weeks, and as the robins care very little for fruit after the first of the season, a really intelligent farmer would naturally look to see what constituted their food during the larger portion of their stay with us. Any person who would kill robins for the injury which they might do his fruit is narrow-minded and insensible to the agricultural interests of his country, and, withal cruel, for at the time when fruit is ripe, the young are in the nest and unable to care for themselves. Therefore in killing one he almost inevitably destroys the whole family.

Robert T. Morris.

EGG COLLECTING IN ILLINOIS.

Peotone, Ill., June 12th, 1876.

Editor Forest and Stream:—

The ologists smong your readers may be interested in reading an abstract from my field-journal. On May 20th I obtained five purple martin's eggs from a nest built in a bird-house. The captures of the next day included two eggs of the mourning dove, containing embryos; two eggs of the pinnated grouse with embryos well advanced, which were ploughed up; and a curiously colored egg of the meadow lark. On June 1st I collected a nest of three eggs of the red-winged black-bird. The

nest was built in a slough, and was firmly fastened to dead reeds and bulrushes; it was made of dry grass and lined with fine prairie grass. I also found a nest containing three eggs of the king-bird. The nest was built in an apple tree about four or five feet from the ground. Six nests of the mourning dove were discovered. The nest is built of a few sticks and a little grass, and is scarcely more than a platform, just sufficiently hollowed to keep the eggs from rolling out. It is built in apple and locust trees about four feet from the ground. Of the nests found some had young ones, seemingly just hatched, and one contained a young bird and an egg which was fresh. They lay only two eggs. Several nests of brown thrashers were found containing young; also of robins. On June 3d I secured seven eggs of the bittern (*Botaurus lentiginosus*) known here as "thunder-pump." The nest was built on the ground, and was nothing more than a slight hollow with a few spears of grass for the eggs to lie on. The eggs are nearly as large as hen's eggs, of an olive green in color, and were nearly hatched. D. H. EATON.

MAY SONGSTERS AT SPRINGFIED.

SPRINGFIELD, Mass., June 10th.

EDITOR FOREST AND STREAM:—

The following list of birds were seen during May in this vicioity:—

May 1-19—White-throated, chipping and song sparrows, blue-birds, robins, kingfishers, king-birds, Baltimore orioles, crow blackbirds, yellow red-polled warbler.

10-15.—Least flycatcher, Blackburnian and yellow-rumped warblers, wood and Wilson's thrushes, brown thrasher, barn swallows, golden-crowned thrush, white-crowned sparrows Nashville and hloe yellow-backed worblers, cat-birds, purple finch, solitary vireo, black-throated blue and black-throated green warblers, redstart, black-and-white creeper, blue jay, crows, and chestnnt-sided warbler.

15-20.—Chimney swallows, chewink, scarlet tanager, rose-breasted grosbeak, hermit thrush, black-capped titmouse, summer yellow bird, Moryland yellow-throat, pine warbler, humming-bird, red-eyed vireo, white-crowned sparrow, red-eyed vireo, prairie warbler, spotted sond-piper, boholink, phebe-bird.

20-25.—White-bellied and bank swallows; eave swollows nesting.

25-31.—Grass-finches nesting; hay-breasted warbler, Acadian fly-catcher, black-and-yellow and black poll warblers, Canadian fly-catcher, red-winged black-bird, orchard oriole, indigo-bird, and mourning warbler observed. FRED H. KEYES.

MARCH MEMORANDA.

LEBANON, St. Clair Co., Ill., June 12th.

EDITOR FOREST AND STREAM:—

The appended notes on the orrival and nesting of several of the migratory birds common here in summer may be of service to your readers: On February 11th a Wilsoo's snipo was seen. This was a straggler, as they are very rarely seen so early in this locality. On March 3d I noticed the first orrival of the towhee hunting, which rorely winters here. On the 8th crow black-birds were migrating northward. On the 13th wild pigeons arrived, though not in ahundance, and the first woodcock was noticed. Red-winged black-birds, killdeer, plovers, kingfishers, and wood pewees arrived the following day. They were much later last year. On the 17th several wood ducks were seen, and the first golden plovers and snipes (*Tringoides maculatarius*). Wilson's snipe first appeared on the 18th, and golden plovers became common. On the 20th I noticed a small flock of cedar-bird which were the first seen here since March, 1875. They are common in this locality in cold winters. Plovers, ducks, and geese were ahundant by the 28th, and blne-birds and crow black-birds were migrating. On the 30th fox-colored sparrows were ahundant; they are common here the whole winter. A few doves also arrived.

WM. L. JONES.

ARRIVALS AT THE CENTRAL PARK MENAGERIE, JUNE 17 TO 24.—One oryx (*Oryx leucoryx*) of North Africa; two hog deers (*Cervus porcianus*) of India; one fallow deer (*Dama vulgaris*) of Europe; one zebra (*Equus Burchelli*) of South Africa; one leopard (*Felis leopardus*) of India; two spotted hyenes (*Hyæna crocuta*) of Sooth Africa; two crested porcupines (*Hystrix cristata*) of Africa and other parts of the Old World; nine cygnets of the European swon (*Cygnus olor*) bred in the menagerie; and one pea fowl (*Pavo cristatus*) of India, also bred in the menagerie.

W. A. CONKLIN, Director.

The Kennel.

THE CENTENNIAL BENCH SHOW.—The Commissioners have decided to change the date for holding the bench show of dogs from the 1st of September until Monday the 4th, and instead of continuing it a week to reduce the time to four days, closing the show on the 8th. The entries will close on August 1st. This change is a decided improvement and will result in a much larger representation. We cordially recommeud all of our readers who possess fine dogs to send them to Philadelphia, and make the show one worthy of the occasion.

FOX HOUNDS ON STATEN ISLAND.—The Staten Island Shooting and Hunting Association, composed of C. M. Johnson, J. F. Rathyen, C. Tranter, and others, are not only taking active measures to protect the game of that island, but are selecting a kennel of superior fox hounds. Among which are Keeler and Tyler, a couple of black, tan and white dogs from the kennel of Mr. W. Martiu, of York River, Va, and a fawn-colored bitch, Musie, from the kennel of Capt. A. C. Evans, of Independence Hill, Prince William Co., Va. Music is now heavy with pup by Col. Payne's celebrated stock dog, Tough. They have also the dog Blue and bitch Cloud (oue year old) from the kennel of A. A. Ross, Esq., Addeson, Somerset Co., Pa., a very promising couple of young hounds, colors, iron grey and black and tan; and, besides, they have Bleaker, an extra fine black, white and tan hound from the famous Joe Donohue kennel, of Hackensack, N. J.; and then, too, they have for stock purposes the imported bitch, Gypsie, belonging to Mr. Nathaniel Drake, of N. J., color, black, tan and white, one of the hest specimens of the English fox hound we have ever met with, and as she is now in pup, by Keiler, the club are anticipating something extra in the way of a superior strain of stylish fox hounds. And as those gentlemen are both enthusiastic and energetic in the cause, the youngsters are frequently given an opportunity to distinguish themselves on a "drag" huut, and the citizens around about are enabled to see a splendid run of the dogs and to hear their melodious voices.

—The New York Kennel Club claims the name of Daisy for a lemon and white pointer pup of Mr. Orgill's Lilly by Mr. Steele's Flake.

THE CRYSTAL PALACE DOG SHOW.

THE eighth Bench Show, held under the auspices of the English Kennel Club, had just closed at the date of our last English advices. That there has been no diminution in the interest in dog matters across the water is evidenced by the fact that, notwithstanding there was a Sunday interveniug, and that the numerous cases of dog poisoning in and about London of late had somewhat alarmed would-be exhibitors, there were 1,145 entries exclusive of the puppies. For pointers there were no less than twelve classes, embracing fifty-eight entries. In the champion classes the prizes fell to Mr. Wippell's Wagg, Mr. Salter's Luna, Mr. Fletcher's Don, and Mr. Whitehouse's Pearl, Cedric, and Minnie, animals all well known to fame. In the ordinary classes, Mr. Willis' Dot, Mr. Price's Eos Cymry, Mr. Salter's Mab, Mr. S. Price's Mike, Mr. Field's Dick, Mr. Whitehouse's Reiue, Mr. Brewis' Roy. Mr. McBride's Juno, and Mr. R. J. L. Price's "Mrs. James Pender" were found in the prize list. Mab was claimed at the catalogue price of £25. Dot could have been bought for £20, but was not claimed.

In the ten classes for setters there were 115 entries, the finest lot of dogs ever brought together. Mr. G. Jones' Rap was first in the champion class for English setters (dogs), beating such animals as Mr. Povey Sim's Dash, Mr. Shirley's Rock, and Mr. Brandreth's Ginx's Baby. Mr. Llewellin took first in the champion bitch class with Princess, the awards in the other classes falling to Mr. Llewellin's Remus, Mr. Macdona's Ranger II, Mr. Laverack's Cora, Mr. Barclay Field's Bass, Mr. Parson's Grouse, Mr. Trevithick's Ronald, Mr. Parsou's Floss, and Mr. Braudreth's Dip II. In Irish setters, Mr. Hilliard won with the puppy class with Rufus. Regarding this class *Bell's Life* says:—

"The setters were quite a feature at the show, eight champions being a number never before arrived at. I have always liked champion Rock better than Rap, as his putting together is so much hetter; Rap falls away behind. However, he got first here in a very stroug class, for Rock, Peter, Bandit, and Simm's Dash, are all nearly A1. In champion bitches Mr. Llewellin was well in front with Princess, and the open dog class, numbering nineteen, went to the same kennel by the aid of Remus, a three-parts bred Laverack, as he is by Prince out of Ruby by Fred II. A good-looking dog he is, with a very beautiful head, and a lot of setter character about him, but he is a bit straight in the hind-quarters, and hardly so powerfully put together as one likes to see them. Blue Prince would take the palm for power, as he has about the best thighs and hind-quarters of any dog in England, and he stamps it on his get; but what has his owner been doing with his coat? It used to be very good, but now Prince is as rough as a water spaniel. This, I expect, told against him. Mr. Brandreth's Rock II was by far the hest made dog of the party—low, lengthy, good shoulders, back and loins, and bent stifles. He has grown a trifle clumpy about the head, but this slight defect should not have put him out of court here, as he possesses all the other setter requisites. Ranger II is not a well made one, as, to begin with, he stands out at the elbows, and he gets worse as he gets older, and Mr. Fletcher's Bounce should be cut off just in front—for his hind-quarter is wretched—with his middling loins and straight thighs. Perhaps Mr. Lort was right in discarding Blue Prince on account of his coat, but I cannot be got out of the way of thinking that Rock II and Blue Prince were the best in the class. I have not much to say against the bitch judgiug, for any judge of a setter must have seeu that Mr. Laverack's Cora, as a piece of animal conformation, is as near perfection as possible, and the texture of her coat is simply perfect. Mr. Barclay Field's Bess is, as I realized at Maidstone, a very graud one, and Mr. Llewellin's Phantom should certainly have been next to her, if not equal, for she is a very beautiful bitch, the same gentleman's Puzzle being also very handsome, though hardly come to her best yet. I did not care about the third, or a lot of the commeuded ones; but only fancied the four I mentioned. The black and tans were headed in point of merit by Mr. T. Bassett's Duke, a wonderfully handsome dog that was picked out by Mr. Evans to win at Maidstone; now he was not for competition, so was led into the ring by mistake, and the real wiuner Mr. E. L. Parson's Grouse, the same kennel taking the bitch class with Floss."

ANOTHER VALUABLE IMPORTATION.—The steamship State of Virginia arrived at New York June 10th, having on board for D. F. Charles, Esq., of Albany, N. Y., the setter dog Nina. Nina is of the oldest and best blood in Great Britain. She was sired by the celebrated Rufus, who won the first prize at the Bedwine exhibition, as in all respects the finest dog there; also the second prize at Plymouth. With these two exceptions he was never shown. Rufus was bred by J. S. Boler, Esq., with Blaze for his sire and Rose for his dam. Mr. Boler has his pedigree from 1784 without stain or stiut. Nina's dam was Mr. Webber's Sal, bred by Col. Justemper. The dam of Sal was Belle. For forty years this breed has been in his family. Nina is in whelp by Royal, who received the prize at the Glasgow show in 1874.

—Let us say to our shooting friends who may need the services of a skillful and careful breaker or a proper place to have their dogs boarded, that Mr. H. Van Schoeck has taken a place at Pennington, N. J., where he has ample accommodation for a large kennel of dogs. We have known Mr. Van S. for many years, aud have had several setters and pointers very nicely broken by him; and as he always keeps the dogs in good condition and is to be relied upon in all relating to the care and management of dogs entrusted to him we take pleasure in recommending him to all who may need his services. His charge for boarding dogs is $4 per month.

Pennington is situated eight miles north of Trenton, N. J., about 35 miles from Philadelphia, and about 60 miles from New York on the line of the new railroad route via New Jersey Central and North Pennsylvania Railroad. See advertisement.

—From Mr. Ethan Allen, of Pomfort Centre, Conn. We are in receipt of a good photograph of his famous bitch, Coscy. Although the coat of Cosey is rather more curly above the stern than we would wish to see, yet, take her altogether, she shows evidence of a fine high-bred setter bitch, as we are informed she is. But as we are promised a few days' shooting over her next autumn, we will then be better able to judge of her merits.

—We are informed by Mr. W. J. Conover, of Monmouth, N. J., that his Gordon setter bitch, Flora, visited Mr. Forman Taylor's one-eyed Soncho on the 22d of May, and that he is anticipating some valuable stock from the cross.

—Gentlemen desirous of purchasing fine red Irish puppies will find some capital ones mentioned in our advertising columns.

—On Monday, 26th inst., Mr. Jas. E. Doxsey received per steamer City of Berlin, from Mr. Jno. Barry, of Tralee, Ireland, a brace of fine red Irish setter dogs for the St. Louis Kennel Club, to whom they have been forwarded.

STANDARD OF EXCELLENCE AND POINTS GOVERNING BENCH SHOWS OF DOGS.—We are frequently applied to for information as to the points by which dogs are judged at bench shows. In the *Fancier's Gazette* (Eng.) we find the following rules, which are observed in England, and which have also been adopted at recent bench shows in this country:—

THE ENGLISH SETTER.

Head long, and somewhat narrow, with a fair distance from the eye to the end of the nose, which should not be snipy or ant-eater like; skull a little prominent; ears set on low and flat, not thrown back; the least stop just above or across the eyes; jaws level, with a little fullness of lip just at the back of the mouth; eye large, but not protruding, with a quick appearance; neck thin and deep at setting-in on chest, moderately long and slightly arched, with no appearance of throatiness; shoulder-blades long and well receding at the points, with a flatness at shoulder-sides not noticed in any other dog; narrow at shoulder-point, but great muscular development in the shoulder-blades and fore-arms; chest very deep, not over narrow between the fore-legs. It is seldom you find the setter with such a round, cat-like foot as the pointer. Fore-legs strong and muscular in the fore-arm; leg straight, with a slight, clean-like appearance; foot moderately round, but oftener flat; back wide, deeply ribbed, lowering slightly from the shoulder to the bip; loins wide and very muscular; stifles full and well developed; hock well bent; stern carried almost level with the back, a moderate length, well flagged from the root, wearing off to nothing at tip of stern; coat wavy or stright, fine, and silky, free from curl, especially on hind-quarters.

POINTS IN JUDGING.	
Head	25
Neck	10
Shoulders	15
Legs	10
Feet	10
Loins and Thighs	15
Coat	10
Stern	5—100

In our next and subsequent issues we will give the points for Irish and Gordon setters, pointers, and spaniels.

KENNEL PRODUCE.—Mr. J. E. Fisher's red Irish setter bitch Belle, whelped on 15th inst. five pups, two dogs and three gyps, by Hamilton Thompson's Dick. They are all blood-red and doing well.

Sea and River Fishing.

FISH IN SEASON IN JUNE.

FRESH WATER.	SALT WATER.
Trout, *Salmo fontinalis.*	Sea Bass, *Sciænops ocellatus.*
Salmon, *Salmo salar.*	Sheepshead, *Archosargus probatocephalus.*
Salmoo Troot, *Salmo confinis.*	
Land-locked Salmon, *Salmo Gloveri.*	Striped Bass, *Roccus Eneatus.*
Greyling, *Thymallus tricolor.*	White Perch, *Morone americana.*
Black Bass, *Micropterus salmoides;* *M. nigricans.*	Weakfish, *Cynoscion regalis.*
	Bluefish, *Pomatomus saltatrix.*
Muskanonge, *Esox nobilior.*	Spanish Mackerel, *Cybium maculatum.*
Pike or Pickerel, *Esox lucius.*	
Yellow Perch, *Perca flavescens.*	Cero, *Cybium regale.*
	Bonito, *Sarda pelamys.*
	Kingfish, *Menticirrus nebulosus.*

TROUT FLIES IN SEASON FOR JULY.

LITTLE EGG, No 14.—Body and feet of orange and yellow, mohair and hare's ear mixed; wings, bright hyaline, slightly mottled; Same, same as wings.

LIGHTNING BUG, No. 10.—Body of equal parts, of dark brown, and black mixed, tipped with yellow: feet, of feathers from the English grouse; wings, double, the inner wing black, the outer wing a yellow brown.

GENERAL HOOKER, No. 9.—Body made of bright yellow and green, ringed alternately; feet, red hackle; wings, of the tail feathers of the ruffed grouse.

LITTLE CLARET, No. 11.—Body and feet, dork claret mohair, slightly tinged with blue; wings, of the bittern or brown hen; Same, dark brown.

CLARET FLY, No. 9.—Body, dark claret; feet, black; wings of the brown hen.

FETID GREEN, No. 10.—Body, feet, and wings, o pale blue green.

FISH IN MARKET.—Fish of all descriptions continue abundant and cheap. We quote: Striped bass, 15 to 25 cents per pound; according to size; bluefish, 8 cents; salmon, 20 cents; mackerel, 20 cents each; weak fish, 10 cents per pound; Spanish mackerel 25 cents: green turtle, 12½ cents; terrapin, $12 per dozen; halibut, 18 cents; haddock, 8 cents; kingfish, 25 cents; codfish, 8 cents; blackfish, 15 cents; flounders, 10 cents; porgies, 10 cents; sea bass, 15 cents; eels, 15 cents; sturgeon, 10 cents; lobsters, 10 cents; sheepshead, 15 cents; soft clams, 30 to 60 cents per 100; brook trout, $1 per pound; hard-shell crabs, $4 per 100; soft crabs, $1 50; frogs, 50 cents per pound.

SOMETHING LIKE A CATCH.—Our friend Mr. Bissett, of Messrs. Conroy, Bissett & Malleson, No. 65 Fulton street, visited Barnegat the early part of this week, and in com-

pany with two friends took forty-nine sheepshead averaging eight pounds each. These gentlemen were under the guidance of Captain Jesse Birdsall, of Barnegat. Of the fish we can speak with authority, as two magnificent specimens found their way to our office, and were discussed with relish. The Jerseymen are away ahead of the Long Islanders, in having passed laws prohibiting the use of pound or purse nets in Barnegat Bay. There might be as good fishing in the Great South Bay off Fire Island, but if a weakfish or sheepshead is taken the fact is the signal for every "fly-by-night" in the bay to sweep the spot with a net. What might have furnished sport for a season was spoiled in a day by one man sweeping the spot where the sheepshead had congregated, and taking them *by the ton*. Let's annex Jersey and give Long Island over to Mr. Popenhusen!

—Our correspondent, Mr. E. Brown, 92d street, sends the following record of striped bass caught in the Hell Gate, East River, this season:—

May 20th, one bass, by Mr. Merrill, four pounds.
May 28th, two bass, nice and two pounds, by by Mr. Gillen.
June 4th, three bass, seven pounds, by same.
June 5th, two bass, seven pounds, by same.
June 5th, one bass, two pounds, by Mr. Dillon.
June 5th, two bass, three pounds, by Mr. Merrill.
June 19th, one bass, four pounds, by Mr. Foley.
June 19th, three bass, 11½ pounds, by Messrs. Merrill and Gillen.

He weighed the fish himself.

—A Boston correspondent sends the following score of fishing in Rangely Lakes:—

EDITOR FOREST AND STREAM:—Perhaps you may think the enclosed record of my last trip to Rangely Lakes worthy of mention in the columns of the FOREST AND STREAM:—

First day—7 lbs., 1¾, 2¼, 1½, 1, 1, 1, 6¼.
Second day—3, 3, 2, 4.
Third day—2, 3, 2¼, 4¼.
Fourth day—1½, 1, 1, 5.
Fifth day—1, 5½, 3½, 2, 3¼, 3¼, 2½.
Sixth day—4½, 3½, 1, 1, 1.

Thirty-two fish weighing eighty-five pounds in six days fishing. We, of the the Anglers Association, as well as the oldest fishermen of Rangely, call it remarkable. They were all caught by trolling, and all that were caught, excepting one quite small, which one was returned to the water to be caught again. These weights are correct, as one of your neighbors will testify, Mr. Geo. P. Rowell, ask him? IVERS W. ADAMS.

NEW YORK—*Little Falls, June 19th.*—Just out of the wilderness after a three week's tramp. Fishing got very poor after my first week. We had had a fine day's trolling, and that evening a terrific thunder storm, lasting nearly all night, seemed as though it would tear the very hills from their foundations. The tremendous reverberations from the mountains which surrounded Pisco, extended, one row into the next, until it seemed as though a cannonade of more than human artillery was taking place. Verily it was a Centennial. Next daynot a laker arose to the spoon, and even the golden shiner sported unharmed upon the surface. For a week we had bright still days with the lake like a mirror, and sport was at an end; for each evening a thunder storm wound up the blazing day, and whether it be true or not, I am a convert to the view that thunder spoils fishing. I extended my trip and fished Lake Pleasant, Round Lake, Spy Lake, Lily Lake, Wall Lake, and others, and have lots of them for a future letter. PISECO.

MASSACHUSETTS—*New Bedford, June 20th.*—The New Bedford *Mercury* mentions having seen several messes of fine trout recently in the hands of the knowing anglers. four of which weighed seven and three-quarters pounds. There is no doubt of there being fine trout in that section, but they won't tell where to catch them.

NEW JERSEY—*Barnegat Inlet—Kinsey's Ashley House, June 25th.*—June 19th, P. P. Gustine, Jas. P. Malsed, Jacob Fries, H. Myers, H. A. Reeves, of Philadelphia, catch of Sheepshead in parts of three days amounted to 96 heads, running from 5 to 12 pounds. With the exception of two days this week, sheepshead have bitten freely and from 150 to 200 per day have been taken off the grounds. Blue fishing nearly all the week has been dull. Chas. D. Middleton and party of Germantown, Pa., took 40 on 21st. There has been plenty of fish, but the water too thick. On the P. M. of the 22d, Capt. N. Clammer with party from Burlington, N. J., fell in with schools of large fish outside and took 40 in a short time. On the 23d, what boats were so fortunate as to be outside the inlet, made the following big catches: Joel Ridgeway with party, (unmee not registered) 60 blue-fish: Capt. John Kelly with Messrs. Baumgardner, Franklin, Breamen, Conomy, of Lancaster, Pa., and Woodward, and A. Ross, of Philadelphia, over 600 pounds; Capt. Vincent Inman with L. E. Klots, L. F. Lentz, W. O. Lentz, Mauch Chunk, Pa., 450. The fish would average 8 pounds apiece. Inside the bar same day, Chas. Vandegrift and party, of Philadelphia, 25 blue-fish average 3 pounds. B.

CANADA—*Waterloo, P. Q., June 1st.*—The season has been very backward here in the Eastern Townships, but now large quantities of "lunge" (lake trout) are being taken in the Brompton and surrounding lakes, and full baskets of speckled trout varying in size from three ounces to as many pounds are brought in every day. Black bass are reported to be more plentiful in Brome Lake this season than they have been for several years past. STANSTEAD.

—A letter from Andrew Clerk, Esq., of this city, who is lessee of Grand River, Gaspe, P. Q., received here on the 26th instaut, reports the river still too high for salmon angling, and the water too cold.

Valcartier, Canada East.—Back of Quebec and north of the Jaques Cartiers, the snow on the 21st inst., was ten to twenty feet deep in many places, and as a result the river was very high and the water intensely cold. I fished for two days without a rise, and as there was no immediate prospect of matters improving for a fortnight or ten days, I left in disgust. The musquitoes were legion, and night and day they continued their persecutions, granting no rest to the poor wearied sportsman. G. M. FAIRCHILD, Jr.

FISHING MOVEMENTS.—The number of fishing arrivals reported at this port the past week, has been 115, the largest number by 24 of any week this year. There were 6 from Grand Banks, 1 from Western Banks, 50 from Georges, 57 from Southern mackerelling trips, and 1 from Newfoundland. The receipts for the week have been 780,000 lbs. cod-fish, 400,000 lbs. halibut, and 8,000 bbls. mackerel. The large receipt of mackerel has had a tendency to unsettle the market, and buyers show a disposition to hold off for lower prices than were paid for the earlier fares. Cod-fish are in fair supply, and Georges are offering at a slight reduction from former quotations. There is no change to note in other departments.—*Cape Ann Advertiser, June 23d.*

HOW TO FILL A CREEL.

PHILADELPHIA, June 17th, 1876.

EDITOR FOREST AND STREAM:—

In your paper of June 15th is a very pleasant letter from one of your correspondents, "Scott," written, the author says, by reason of the incidents called to mind by reading an article of mine in a previous paper. "Scott's" experience reminds me of an incident of the same kind which I had forgotten. Several years ago I spent a few days in June fishing in Broadhead's creek, making headquarters at Jim Henry's. There were two friends with me, both good fly-fishermen, and we had a close thing of it as to which of the three would get the most fish. The last day of our stay my companions decided to go to the east branch to fish, but advised me to stay where I was, as the east branch was rough and rather deep, and they thought that as I had one hand—my left—I might come to grief in some deep hole. After they had gone I started out, determined to do what I could for top count. About the middle of the morning I found myself at the road which runs up the creek, and where I struck it crosses Paradise Run, an affluent of Broadhead's creek, by a bridge. I had fished down the run, and standing on the bridge debated where to go next. Suddenly an idea struck me. It is not more than two hundred yards from the bridge down the run to the creek, the angle between the two streams being a broad gravel beach mostly, and the run from the bridge down a shallow ripple. I imagined that in all probability nine-tenths of the people who fished down the run upon reaching the road would step on the bridge as I had done, and looking across the angle of gravel beach would be tempted by the sight of the main creek so near, and go at once to it instead of wasting time in the remaining few yards of run below the road, so I determined to fish those two hundred yards. The result of carrying out this determination was, that I caught fourteen good trout before I reached the main stream. Encouraged by the result of this piece of common sense, I set to work elsewhere, and then my companions came back from their day's sport and we "pounded noses." I had the top string. I will confess that I did not confine myself to a fly all the time, but then I had only one hand to use, and that makes a difference in speed if nothing else. C. C.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

J. P. G.—Is Captain Hutchinson's celebraied Irish setter Bob still living; if so, where; if not, how long has he been dead? Ans. The dog Bob has been dead three or four years.

R. G., New York.—What is it you call "churn" (as used in catching blue-fish) in your last number, page 319? Ans. Menhaden or moss-bunkers cut up fine and thrown from the boat while fishing.

T. M. D., Washington, D. C.—Can you tell where I can I get the rules and regulations of the game of polo, and the price? Ans. Full directions for playing polo in our issue of June 1st, page 272.

C. S., New York.—Will you be kind enough to tell me whether the $25 Moore gun, English, is equal in every respect to a Parker gun of the same price? Ans. We cannot discriminate between guns of different manufacturers.

SUBSCRIBER, Boston.—Is there any trout fishing near Gorham, N. H.? What is the best time of day to fish for trout? Ans. Good fishing within a circuit of fifteen or twenty miles of Gorham. Best times, morning and evening.

S. E. G., Hartford, Ct.—Can you name any publications upon Oology; and is there any journal devoted to the subject? Ans. There is no book issued yet, devoted specially to nest and eggs of American birds, but several English works. S. L. Willard & Co. issue a monthly magazine, "The Ologist," at Utica, N. Y.

J. T. L., Newark.—Can you recomend any good shooting or fishing locality in Sullivan county, this State? Ans. Take Oswego and Midland R. R. to Moreston, where there is good trout fishing in the Willewemoe and good hotel at depot. Eight miles distant Murdock keeps a noted sporting house, and Callicru is also a good centre.

JONES, Pittsburgh, Pa.—I contemplate visiting Colorado, in the vicinity of Denver City. What would you advise me to take, rifle or shot gun? Ans. Take a rifle in preference to a shot gun. One of Baker's improved rifle and shot guns would be better. See his advertisement in our columns, or address W. H. Baker, Lisle, Broome County, N. Y.

J. M. L., Boston.—Two or three young men would like to know of a place in New Hampshire where good trout fishing can be had from brooks sometime during next month? Also, can you recommend any one with whom we can board for two weeks; do not wish to go too far north? Ans. See answer to "Trout" and "Subscriber" in this issue.

TROUT, Tuuntoo, Miss.—Will you be kind enough to inform me in your next issue if there is good trout fishing to be found in any part of New Hampshire, and if so at what place or places? Ans. Take Grand Trunk R. R. to Stratford, stage to Colebrook, wagon to Errell's Falls on the Megalloway River; good fishing to its source, Lake Parmachene, and also on the small tributary streams.

LEACH, Honesdale, Pa.—What are Canada shoe packs? I cannot find any one here who knows what they are. Ans. Shoe packs are more generally known as beef-skin moccasins. They are sewed like Indian moccasins, have long legs and no soles. Some are made to go around the ankles like ordinary moccasins. They can be bought in any of the principal towns in Canada near the lumber districts.

G. G., New York.—Will you please inform me of the best time for catching black bass in Connecticut, and what are the most desirable places for such fishing? Also what tackle and bait is best? Ans. Most of the larger lakes in the State have been stocked with black bass by the Fish Commissioners and afford fair fishing. Twin Lakes at Canaan, on the Western R. R. are highly spoken of. It is a beautiful section and good board for ladies and gentlemen can be obtained in the vicinity.

G. B., New York.—Would you be kind enough to inform me, through your valuable paper, how the law is in Canada about fishing in summer? Could I fish for pike, pickerel, sturgeon, etc., with a large trap net all summer? Ans. We can find nothing in the general laws of Ontario and Quebec to prevent you from fishing in the manner and for the fish you mention after the 1st June. But there are many local regulations, and a non-resident would probably not be allowed to fish with a net at all.

JENKINS, Bethlehem, Pa.—How is the trout fishing in McKeon county, this State? Can you also inform me of any fish breeders in that section where I can get young fish and fry? Ans. There are some excellent trout streams in McKeon county. Address W. H. Crowell, Ludlow Trout Ponds, Ludlow, McKeon county, Pa., who claims to have more brook trout breeders than any other establishment in the State. They have 10,000 three years old, 15,000 two years old, and any amount of fry.

G. McC., Philadelphia.—Will you be kind enough to furnish me, through your Answers to Correspondents, the name of the publishing house in New York of Pennel's book on artificial flies, making, &c., &c. He has a system of his own, having four typical or standard colors; also the make of flies are particularly his own. You will also favor me by stating the price, so that I can send and get it by return mail. Ans. Messrs. Scribner, Wellford & Armstrong, No. 743 Broadway, have the book in question; price, $3.

A READER, Ayer, Mass.—I have a setter dog 17 months old which is affected with vomiting every two or three days. What is the cause, and what would be best to give him, also what do you consider the best food for dogs, at this season of the year? Ans. It is not at all unusual for dogs to get out of fix and vomit during the hot months. We will send you by mail some condition powders which may be of service to you. There is no better food for dogs than the refuse of the table, scraps of meat, bones, and vegetables.

H. N. C., Waterville.—You will find in this mail a copy of an act which passed the Assembly this last winter. I have read it carefully and can't come to any other conclusion than that woodcock can not be shot until the 1st of September next. Ans. The printed bill you send us never became a law. Woodcock can be shot in this State, except in such counties wherein the Supervisors have passed local laws, on July 3d. As the law reads, the close season is "*between* February 1st and July 3d. Document returned.

M. G., Greenpoint, L. I.—Will you please inform me, through your valuable columns, where I can get some good woodcock shooting, and also trout fishing, in the vicinity of L. I., and what railroad to take, as I will have a vacation in the middle of July? Ans. We are informed that there is good woodcock shooting near Syosset, but nearly all lands on Long Island are strictly preserved. The same remark applies to trout fishing, though you may find some near Ridgewood, 28 miles from Hunter's Point; inquire for E. H. Seaman.

T. L. D., Gibsonton Mills, Pa.—1. Would you inform me of the best fly bait for trout last half of July; a party of us are going to Bear Creek, W. Va., about that time. 2. What do you advise to rid a dog (setter) of lice; thought of using tobacco juice, (boil the tobacco and use the liquor from it) but will wait to hear what you say? Ans. 1. The scarlet ibis, the professor, coachman, grizzly king, queen of the water, gray palmer, wren fly, and governor, are approved patterns for July. 2. Blow Persian insect powder into his hair with a rubber ejector, such as are sold by druggists.

VAN B. & B., Brooklyn.—I have been informed that there was an amendment to the game laws of the State, passed at the last session of the Legislature, in relation to summer shooting of woodcock. Will you be kind enough to inform me what this amendment amounts to? I wish to find out how the law affects Kings and Queens counties. Ans. You must have overlooked the statements, official and informal, repeatedly made in these columns that the amendments as passed were not signed by the Governor, and consequently the law remains unchanged. We can shoot woodcock on July 4th, as before.

READER, Covington, Ky.—I have an English setter pup (dog) 4½ months old. Of late he has eaten very little. (I feed him on oat and corn meal porridge, corn-bread, crackers, and bread and milk). He lies on the side of his hindquarters, with his nose sometimes close to the ground. He is not near as playful as he was, and his nose is warm and a little moist. Please tell me what ails him, and the best course to pursue; also tell me when I must begin to train him? Ans. Your pup is in all probability afflicted with worms. Have mailed you a remedy. He will be old enough to break during the coming fall and winter shooting.

W. H. S., Philadelphia.—1. What is the best thing to grease patches with for a muzzle-loading rifle, and will it hurt the gun to use the patches without greasing them? 2. How do the Remington shot guns wear? 3. Which would you advise buying a $100 English gun, or an American one at the same price? Ans. 1. It would not injure a rifle to use patches without grease, but it is decidedly better to grease the patches, and almost any kind of grease answers the purpose? 2. The Remington shot gun wears well. 3. For $100 you can purchase from any of the gun dealers advertising in our columns a good, safe, serviceable gun of either American or foreign make.

F. H. P., New York.—Can you inform me what kind of shooting and fishing I can expect down Barnegat Bay in the second week in August; also please give me the address of one or two good houses for a couple of young men of small means to stop at. Ans. Sheepshead, weakfish, and sea bass, with a few bluefish, king-fish, blackfish, etc. The fall flight of bay birds, snipe, and the like, generally begins about the middle of August, and sometimes a little earlier. Quail are found on the uplands. There is a good house at Barnegat Village, another at the Inlet (Kinsey's), and E. H. Frame's, at Forked River. The large hotels on the beach are expensive.

WANNALANCIT, Lowell.—1. Can you or any reader name a good reliable guide somewhere on the coast between Portsmouth N. H., and Boston with whom to go for bay birds during the coming open season? If there is any chance for choice, would prefer some point between Salem and Rye. Perhaps "Teal" can give me some information. 2. When is the open season in New Hampshire for birds mentioned? 3. Where is the very last place on any part of coast line from Boston to southern end of Long Island; and can you name guide and address? Ans. 1st and 3d. Write to E. L. Newcomb, Salem, Mass. 2. The close season for plovers, yellow-legs, sandpipers, or rails expires in New Hampshire on August 1st.

G. S. L., Brooklyn.—1. Which is the best dog for woodcock hunting, a full blood pointer, or a setter? 2. I have a pointer who catches rats, will it do her any hurt, if so, how shall I break her of it? 3. Do you use the same quantity of Dittmar's powder for a shot gun as you do of Hazard's or Dupont's? 4. Is there any woodcock hunting on Staten Island; if so, what part? Ans. 1. We prefer the setter for woodcock shooting, yet we have owned some exceedingly good pointers for this game. 2. It is decidedly wrong to allow a setter or pointer to catch rats, as it is almost certain to make him hard mouthed and mutilate game in retreiving. 3. Use the same in bulk. 4. Quite a number of woodcock are hatched on Staten Island, but they are mostly shot off by pot-hunters before the season opens.

W. B. N., New Haven, Conn.—Happening to be in Central Maine the first of this month on business, I was invited by an old friend to go with him to a pond for one day's fishing. Not being a fisherman, my friend cut for me an alder pole, ringed hook and line, put a fly club on the hook, and told me where to stand on the rocks and fish. I went to work and caught 33 fish weighing nearly ten pounds. Now, I wish to ask if these fish, which they called spotted trout, are the same as brook trout. They all have square tails. They say that they have another species of trout with crotched tails, called togue or lakers, which run much larger. Are the latter salmon trout? 2. Would a fly have been more tempting than live bait? 3. I purchased of Thompson & Son a canvas gun cover, said to be waterproof, but it proved to be anything but that. Can I use any cheap preparation to make it so? 4. Was the gun made by Wesson & Co., of Springfield, a good one, and why did they abandon the manufacture? 5. How do the Westley Richards guns stand, how many qualities do they make, and what are their prices? Ans. The first were brook trout and the latter salmon trout. 2. You would not have done so well with the fly. 3. If you will return your gun case to Messrs. Thomson & Son they will have it waterproofed. Having discovered that the system at first used by them was sometimes uncertain, they have dropped it and adopted the Tew an process, which is infallible. 4. We do not know. 5. There "scotia, [illegible] alities of Westley Richards' guns, ranging in price from [illegible] to $250. They make a No. 1.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, JUNE 29, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Editor and Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, June 29th.—Racing: Point Breeze Park, Philadelphia. Trotting: Watertown, N. Y.; Hartford; Stillwater; East Saginaw, Mich.; Wilkesbarre, Pa.; Suffolk Park, Philadelphia. Regatta: Central Hudson Yacht Club, New Hamburgh. Base ball: Mutual vs. St. Louis, at St. Louis; Boston vs. Louisville; at Louisville: Athletic vs. Chicago, at Chicago: Alaska vs. Orange, at Orange, N. J.; St. Louis Reds vs. Neshannock, at Newcastle, Pa., Mutual of Jackson vs. Ætna, at Detroit, Mich.; Covington Star vs. Kleinz, at Philadelphia; Defiance vs. Campbell, at Philadelphia; Lowell vs. Ithaca, at Lowell; Cricket vs. Osceola, of Osceola, Pa., at Elmira, New York; Wilkesbarre vs. Peabody, at Wilkesbarre Pa.

FRIDAY, June 30th.—Trotting: Suffolk Park, Philadelphia; Chicago, Ill, Harvard and Yale eight-oared race, Springfield Regatta: Bergen Rowing Association. Base ball: St. Louis Reds vs. Standard, at Wheeling, West Virginia; Lowell vs. Rhode Island, at Lowell, Mass.; Athletic vs. Volunteer, at Poughkeepsie, N. Y; Chathams vs. Star, of Newark, at Hoboken, N. J.; Alaska vs. Olympic, at Paterson, N. J.; Monticello vs. Mutual, of Newark, at Jersey City; Arlingtons vs. Keystone, at Jersey City

SATURDAY, July 1st.—Racing: Long Branch. Trotting: Suffolk Park, Philadelphia; Chicago, Ill.; Galesburg, Ill. American Rifle Association meeting Glen Drake. Base ball: National vs St. Louis, at St. Louis; Boston vs. Louisville, at Louisville; Hartford vs. Cincinnati, at Cincinnati; Athletic vs. Chicago, at Chicago; Chelsea vs. Nameless, at Brooklyn; Resolute vs. Union, of Newark; Keswick, at Elizabeth, Athletic vs. Active, Brooklyn, at Wap. . N. Y.; Contest vs Eureca, at Brooklyn; Mutual, of Jackson, Mich., vs Tecumseh, at London, Ont.; Quickstep vs. Alpha, this city.

MONDAY, July 3d.—Trotting: as above, and Nashua, and Oskaloosa, Iowa; Dayton, O.; St. Paul, Minn. Base ball: Cricket vs. Ithaca, at Binghampton, N. Y.; Mutual vs. Indianapolis, at Indianapolis, Ind.; Quickstep vs. Resolute, at Hoboken, N. J.; Osceola vs. Waymart, at Honesdale, Pa.; Clipper vs. Starlie, at Milton, N. Y.; Chelsea vs. Harvard College, at Brooklyn. Nameless vs. Rosehill, at Waterbury, Ct.

TUESDAY, July 4th.—Racing: Long Branch. Trotting: Meriden, Ct; Amenia, N. Y; Suffolk Park, Philadelphia; Detroit, Mich.; Belmont Park, Philadelphia. Regattas: rowing and sailing, Boston; regatta, Peoria, Ill; Sewanhaka Yacht Club regatta; Northwestern Amateur Rowing Association regatta. Base ball: Mutual vs. Louisville, at Louisville; Boston vs. Louis, at St. Louis; Hartford vs. Chicago, at Chicago; Athletic vs. Cincinnati at Cincinnati; Resolute vs. Harvard College, at Elizabeth: Nameless vs. Bridgeport, at Bridgeport, Ct.; Clipper vs. Sunnyside, at Milton, Pa.; Alaska vs. Irving, at Honesdale, Pa.; St. Louis Reds vs. Philadelphia, at Philadelphia; Covington Star vs. Quickstep, at Wilmington; Cricket vs. Ilion, at Binghampton, N. Y.

WEDNESDAY, July 5th.—Trotting: as above, and at Point Breeze Park, Philadelphia. Regatta: Toms River Yacht Club; Northwestern Amateur Rowing Association regatta: Burlington (Iowa) regatta. Base ball: Covington Star vs. Resolute, at Elizabeth, N. Y.; Alaska vs. Carbondale, Pa.

—The Prospect Park Hotel, Catskill, is one of the most delightful sanitaria on the Hudson river. See advertisement

INTERNATIONAL ROWING.

THE Saratoga rowing races have been announced—the College Regatta, 18th and 19th July; the International Regatta of the Saratoga Rowing Association, 7th and 9th August; and the International Collegiate Regatta, 11th August. On the time for the College Regatta we have no comment to make; but the advisability of the fixture for the international races, especially the International Collegiate race is questionable. This is the Centennial year, and in the wisdom of Congress the International Exhibition has been made at Philadelphia. The justice of the choice is, perhaps, beyond dispute. Such an exhibition, intended to display this nation's growth, would have been incomplete without some exposition of the sports of the country. Not the least prominent among out-door exercises in America, in fact the world over, is rowing. More than two years ago the Schuylkill Navy, being the representative organization of Philadelphia, feeling that it was a fair exponent of amateur rowing, and that on it would devolve the rowing department of the Exhibition, assumed the no slight responsibility of these contests. Their Commodore, with much disinterestedness, proposed that he should be authorized to visit the foreign clubs to organize an International Regatta. Armed with credentials he visited England, Ireland, and France, and keeping constantly before him the idea that these regattas must be part and parcel of the great Centennial Exhibition, he invited a meeting in London of the captains of rowing clubs of England, and finding them, as well as representative college oarsmen, well disposed to the project, he at once extended an invitation to all responsible rowing clubs in the United Kingdom to take part in a truly American International contest on the Schuylkill this year. Dublin gave like encouragement, and upon his return the Schuylkill Navy, under the direct sanction and approval of the Centennial Commission, sent not only their own circulars but those of the Commission, inviting all the rowing organizations in the world to enter. Races were provided for all—amateurs, graduates, under-graduates, and professionals. It would seem that patriotism alone would urge all Americans to encourage the scheme. When the Convention of American Colleges met at Hartford in February, 1875, the matter was set before them. They were shown that, with their co-operation, the International Graduates and Under-Graduates Regattas could be made the greatest rowing events of the world. The College Association, however, in November, 1875, concluded that for its own glory or profit it would be more satisfactory to have an International College Regatta at Saratoga under its own auspices, and sent challenges to Cambridge, Oxford, and Dublin to row them in sixes early in July. They did not stop to consider the convenience of their guests, or they would have known that the English crews were not likely to go to strange waters to row in strange boats, nor were they likely to forego Henley, to attend to which they could not leave before the latter part of July.

These matters secured careful consideration by the Philadelphia committee as may be seen by the making their races fours, and after August 20th. As might have been expected these challenges were all declined. Again ignoring a to be expected sentiment for the Centennial year, another set of challenges was sent out modified as to date and style of boats, which were again respectfully declined. The spirit of fair play would point out races upon equal terms. Philadelphia would offer a course equally new to all.

Did the College Association forget that a field was open to all on equal terms, where, with their assistance all were likely to meet, or did the inducements of the Saratoga Association, who certainly bore the expenses of the ambassador (professedly of the colleges) and who wanted to fill the hotels if possible, and wrest the honors from the Centennial Exhibition, over-ride any such consideration? If we will suppose Cambridge and Oxford, (who have declined) and Dublin (who are not at all certain), were all to go to Saratoga and were beaten by Harvard, Columbia, Amherst, or any other American college, and still intended going to Philadelphia as Cambridge and Dublin certainly and Oxford probably will, the victorious crew at Saratoga would decline to row them again, having already won all the honors they could get. On the other hand, supposing one of the foreign crews to have won, being already committed to the Centennial, it could not refuse to immediately afford its once beaten antagonists another chance, subject to all the contingencies that attend boat racing.

This may not be really wrong, but it is hardly courteous treatment to guests. The efforts of the American colleges to secure a race made in good faith on their part, but ill-advised, deserve all the glory they will get by a victory, if as is to be hoped, they earn one, but where would the glory be less in winning at the Centennial? Is it not that Saratoga can by aid of the hotel keepers, and others interested pecuniarily, offer what they themselves have named "inducements?"

Rowing for a show is not the spirit of amateur sport. Is the sentiment of college rowing lower than the standard of gentlemen amateurs? How will we stand before our visitors as a sporting nation when they realize that their crews have been induced to come over to be made a show of? Will they not feel as did the heroes of Balaklava, when after accepting an invitation to dinner, they found they had been on exhibition at a shilling a head?

Whatever may be the advantages possessed by Saratoga for holding the annual college regatta, certain it is that in this Centennial year all races of an International character should be rowed at Philadelphia. No where else are they likely to succeed. Look at the wretched attempts in New York Harbor, and the farce of starting two schooners and two sloops on a Centennial regatta.

THE INTERNATIONAL RIFLE MATCH.

WHATEVER may be the cause, it is an undisputed fact that the rifle competitions of this year, particularly as regards the so-called International Matches, are not creating the same amount of interest that they did in 1875. One reason, of course, is, that our men are not going abroad to do battle for our country, another, and the most important is that the competitions for places on the two teams have been almost entirely sectional in character and the great body of riflemen throughout the country are unrepresented. One gentleman from Chicago and another from Boston appeared to compete; with these exceptions the contestants are residents of New York or its immediate vicinity. Why are the various rifle clubs throughout the country unrepresented in these competitions? In many places, for instance, Savannah, Detroit, Saratoga, Milwaukee, Chicago, New Orleans, and San Francisco, there are riflemen with excellent records at the longer ranges. Why did they not compete? It is a question well worthy of the attention of the officers of the National Rifle Association. If the first competitions had been held at home under the jurisdiction of his own club, and a certain figure had entitled the competitor to shoot at Creedmoor in a final trial, we believe that a large number of entries could have been obtained; but the impression, very erroneously we think, appears to have gotten abroad that there was a feeling of jealousy existing towards "outsiders," that would keep them from obtaining places at all hazards. This plan, however, is worthy the attention of our rifle authorities another year. The question of expense which may deter the rifleman from a distance would be put at rest after he had distinguished himself in the home competition. It is scarcely correct now to call the coming event International matches. Great Britain is represented only by sectional teams, nor can our own be termed a representative team. The object should be, and it should be pushed strenously, to have a team drawn from all quarters of the country.

Admitting their unexcelled skill we are still pleased to see that some of the gentlemen who composed the American Team of the last two years have refrained from participating in this year's competitions. Not only is it in excellent taste to give the coming generation of riflemen a chance and encouragement, but we are saved the imputation, which even their success would have entailed, of having but one rifle team in the country. It will be remembered that we have two teams this year, although the members are almost identical; one to participate in the Centennial matches and another to contest with the Irish rifle team in reply to their challenge to fight the battle of Dollymount again. The Irish team will be a remarkably strong one, and its members are sparing nothing in the way of practice.

—Among the most valued of our exchanges is the *London Illustrated Sporting and Dramatic News*. Unfortunately for us its value is so generally recognized that if we secure three copies out of five we esteem ourselves particularly fortunate. If this average could be increased we should be highly pleased. Our other English exchanges come with perfect regularity. Apropos of the post office, we have received from Mr. Boutcher, of Easton, Penn., his charming little pamphlet entitled "The Southwest Revisited," upon which, notwithstanding that it was rolled with open ends we were called upon to pay twenty two cents extra postage. Knowing of several other of the pamphlets having been received in the same expensive manner, we advised Mr. Boutcher of the fact, and subsequently received another copy of the pamphlet, upon the wrapper of which the nature of the contents was noted. Upon this copy we were compelled to pay *twenty-eight* cents extra postage. Beyond their being rather tightly rolled there was neither rhyme nor season in any extra charge being made for the first lot, and considering that our Newfoundland correspondent sends us fifteen pages of tightly rolled MS. for eight cents, we can only infer that there is a screw loose somewhere in the post-office which it is well should be examined.

THE INTERCOLONIAL RAILWAY.—It is now a little more than a fortnight since through passenger trains began to run on the Intercolonial Railway between Halifax, St. John, and Quebec. There is therefore now an all-rail communication between the two large maritime cities and the upper provinces and the United States, the Intercolonial having a direct length of 568 miles from Halifax to Riviere du Loup on the St. Lawrence, and 463 miles from St. John to the same point, where it forms a junction with the Grand Trunk Railway. It is 126 miles from Riviere du Loup to Quebec. The total length of the Intercolonial in operation is 713 miles. The Chatham *Advance* says the time tables need adjusting on that part of the line between Riviere du Loup and the Restigouche. Nevertheless, anglers will now find it a comparatively easy matter to reach this salmon region, and will not grumble too much at present irregularities. Several miles of the Restigouche is to lease for salmon fishing at $1 per day per rod. Apply to John Mowatt, Fishery Overseer, Dee Side, Metapedia, Restigouche, Canada.

GAME PROTECTION.

—The Sportsman's Club of Yonkers is doing good work in protecting the oyster beds in the Hudson in their vicinity from being robbed in violation of the law. A few days ago notice was given them that some boats were engaged in illegal fishing, and Messrs. A. J. Prince, Fred. Shonnard, G. Rayner, and F. S. Garabont, with the city marshal and a constable, started in pursuit. Two boats from Mariner's Harbor, Staten Island, were captured with their oysters and implements on board, and the captains fined.

—The people of Rochester appear to be determined to break up the illegal fishing which is being carried on in their river and the lake. The *Express* says:—

"Henry Lockhart was incarcerated in the jail yesterday for fifty-four days, in default of a judgment taken against him for illegal fishing in the river, in a suit brought by Game Constable Brown before Justice Allen. This is the third term of imprisonment Lockhart has suffered for the same crime."

Mr. Lockhart must find that the fishing pays, if he can afford to be imprisoned so often, or perhaps he is such an ardent and enthusiastic fisherman (with a net) that he cannot resist. The same paper says:—

"Game Constable Brown has also commenced a suit for a penalty against Hiram Brown, a property owner, who resides on Hudson street, for shooting robins and destroying their nests, and also shooting orioles."

This is right, and we trust that not even ties of consanguinity will prevent Constable Brown from prosecuting all the other Browns whom he may detect in infringing the provisions of the law. And now a voice from Canada complains to the editor of the Toronto *Globe* as follows:—

"SIR—We have a man out here, lately from England, he says, who seems to have no other amusement than to travel around with his gun shooting all the little birds he can come across. He says he has got a license to kill them for stuffing. Is it possible a man can get a license to destroy these little birds in this wholesale manner at this season? What can we do? If he holds such a license, which I don't believe, can any one demand to see it, or ought he to be summoned at once?"

This "stuffing" business is being overdone. The stuffing, we apprehend, is frequently composed of sage and onions. There is no reason why even naturalists, in the legitimate pursuit of their profession or occupation, should kill birds out of season. Surely six months in the year would be ample. We have heard of men in New Jersey who habitually kill woodcock out of season, and when detected plead the "specimen" clause in the game laws. Under cover of this protecting section much mischief is done, and it will be worth the attention of the committee appointed at the recent State Sportsmen's Convention to see that the latitude which it now conveys is drawn within more reasonable bounds.

WOODCOCK SWAMPERS IN JULY.

HOBOKEN, N. J., June 23d, 1876.

EDITOR FOREST AND STREAM:—

There is a rumor circulating that a party of New York and Long Island sportsmen intend to visit our State of New Jersey on the 2d and 3d of July to shoot woodcock, and "have the first crack at them." This unsportsmanlike practice has been going on for some years, and all authorities around Pinebrook in Morris and Essex Counties are bewith notified and put on their guard for these pot-hunters. Several well-known pigeon shots are said to be among them. Summer shooting is bad enough in itself, and should be abolished by all means, as it is no recreating, healthful sport to shoot half grown, weak birds, get eaten up by flies and mosquitoes, tramp ten or fifteen miles at 90° in the shade, and after all this find your birds spoiled when you come home at night. Why not wait until the 1st of October? Many sportsmen say that if they have no summer shooting they will have no cock shooting at all. If these gentlemen would only leave the birds alone in summer they would stay around and induce many birds bred in the north to stay and tarry with them on their way to the south. It is a well known fact that most fall cocks are found where summer birds are left. JUSTUS.

[The habit that some would-be sportsmen have of shooting before the season opens in order to get ahead of legitimate sportsmen is disgraceful in the extreme, and we are gratified to find that the different associations for the protection of game have made preparations this season to enforce the law upon the subject. We fully agree with our correspondent that summer woodcock shooting should be stopped altogether.—ED.]

SAVANNAH, Ga., June 13th, 1876.

EDITOR FOREST AND STREAM:—

At a regular meeting of the Georgia Game Association, held at their hall last evening, the following officers were elected for the ensuing year: —President, Joseph D. Weed; Vice President, Robert B. Habersham; Secretary and Treasurer, Wm. H. Conneral. Ten new members were also elected.

A very pleasant feature of the evening was the presentation to the association by the Savannah Cadets of a magnificent large steel engraving representing "The Death of the Stag," most beautifully framed, with heavy crimson silk cords and tassels attached. The association values and appreciates this beautiful gift which so adorns their walls, all the more as it was wholly unexpected and unlooked for, and will look upon it as another tie binding the fraternal relations existing between the two organizations.

After the meeting had adjourned, a regular meeting of the rifle team of the association was held, which resulted in its being reorganized, with Mr. Wm. H. Conneral as Captain, and Mr. B. C. Wright as Secretary and Treasurer. GEORGIA.

HUNTER'S CAMP.—We have printed a large extra edition of this week's issue of FOREST AND STREAM, which contains a sketch of the Hunter's Camp at the Centennial Grounds, Philadelphia, on the presumption that very many of those who visit the Camp will wish to retain a picture of it as a souvenir. We should not have allowed ourselves to be anticipated by our illustrated contemporaries in publishing this engraving, but a misunderstanding with our artist as to the time when it was wanted has delayed us.

SNOW IN CANADA.—Our Canadian correspondence shows that snow is still very deep in places north of Quebec.

OUR CENTENNIAL LETTERS—NO. 5.

NATURAL HISTORY IN THE MAIN BUILDING.

THIS afternoon I wandered through the Main Building picking up the fragments of natural history which are to be found mixed in with the arts and industries of all countries. Near the entrance from the Mineral Annex, Prof. W. H. B. Thomas exhibits some interesting natural products from near his home at Mount Holly, Warren County, N. J., where the well-known green marl is found. The fertilizing properties of this earth are celebrated, its excellence consisting in its 12 or 13 per cent. of potash. Professor Thomas also exhibits from his quarries beautiful specimens of a red dolomitic marble, which he styles "rose crystal." It seems as though a sharp blow would shatter a block to pieces; but it has been found to resist very severe strains, and its beauty so recommends it that it is being extensively used for ornamental columns in churches and other large buildings in Philadelphia. Prof. Thomas also derives from his property a mineral water called "Mensent," after the springs, for which great medical properties are claimed. I could not better use this opportunity, by the way, than in heartily thanking Prof. Thomas for much valuable help in acquiring access to and information in all branches of science as illustrated here. His extensive acquaintance among the foreign exhibitors and commissioners, and his generous use of it, will redound greatly to the advantage of FOREST AND STREAM's readers. I forgot to mention the abundance of fossil found in Prof. Thomas's marls, particularly fossil wood perforated by the *Polorthis tibialis*—a boring mollusk similar to the teredo or ship-worm. The destruction which this dreaded mollusk—for it is not a worm, but a bivalve called *Teredo navalis* and classed very near to the common soft clam (*Mya*)—is able to accomplish, is shown by an American firm not far from this point in the building, who advertise a preventive. There you see great blocks of live oak perfectly riddled with the grain, by the closely crowded calcareous tubes with which it lines its burrows. These tubes are usually not much larger than a lead pencil, but are sometimes as big as a broomstick and almost as long. It occupies the greater part of this tube, but the bivalve shell and boring apparatus are only at the inner extremity. They do enormous damage. There is another boring mollusk which would inflict equal injury were it as numerous. This is the *Pholas costata* of this coast, other species inhabiting other regions. The chalk cliffs of England are full of them, where they are known as "piddocks." An excellent example of its work is to be seen in an immense cypress stump, which lies just outside one of the doors of the Government Building. This stump was removed from Cape Fear River, eight miles below Wilmington, N. C., and nineteen miles from its mouth, where the river was improved. The water on the bar was only nine feet, but has been deepened to twelve feet mainly by the removal of the snags. The water must have been fresh to allow the trees to grow where they were standing, but the place has since been covered with salt water, since these stumps are eaten through and through by the *Pholas*. It is exhibited by the Engineers of the War Department.

Close by our starting point in the Main Building, are shining verde antiques from Maryland, and the less resplendent but more valuable chromic iron from Southern Delaware, the unworked ore of which sells at from three to eighteen guineas per ton in London. There is a large demand for its use in the manufacture of chromic acid, etc., and it is rare. Speaking of iron ores, Canada shows magnetite containing perfect fossil spirulas of the Devonian age! Here is a conundrum for geologists. It is surprising to see how much some foreign artists use natural objects as aids to ornamentation, or as the basis of some artistic design. Take for instance the furniture from Russia made of deer's horns screwed together into chairs, stools, stands, sofas, etc., and properly upholstered. But I think I must devote a special letter to this aspect of the Exhibition.

New Zealand has been thoughtful enough to send a very good representation of the Maoris, the aboriginal people of the island, who are fast disappearing. There are many photographs of their faces and forms, dress, war costumes, canoes, and houses. The Maoris are a stalwart race, of far better physique and visage than the Australians. They more resemble the Malays, are warlike and adventurous, and their arts exhibit much skill and ingenuity. Their primitive implements are singularly like those of our western Indians. The tools and weapons of the natives of the Chatham Islands east of New Zealand, also present, are much like them. A prominent weapon is a stone club, highly polished, which is shaped like a narrow pear leaf, the handle being the stem of the leaf. This is fourteen inches long and three wide, but not more than one or one and one-half inches thick. It would cleave a white man's skull easily, but those fellows stand it; their heads are the least vulnerable part of them, perhaps on account of the dense mats of woolly hair which acts as a cushion. This paddle-like cleaver is peculiar to those islanders, but when they fixed a quartz pebble as large as your two fists in the forked end of a stout branch, and thus made a mallet for breaking wood, driving stakes, or knocking on the head a wounded animal, refractory slave, or conquered foe, they hit upon precisely the same device as savages in several other parts of the world. It is a little curious, however, that in the design of another style of tool—a hoe, or an adze, according to whether you suppose it used for digging or chopping—the Maoris and the natives of the Northern Pacific coast of America are almost identical. This instrument was made by cutting a stout branch with a piece of the body of the tree left at the end, forming a T-shaped piece, in shape much like one of our ordinary adzes, if the iron part of the blade was part and parcel of the wood. To the outside of this wooden head is lashed a green stone "celt" with sharp and polished edge in such a way that every blow given with the instrument only tends to fix the bonds more firmly. In the cases of the Smithsonian Institution you will find the exact counterpart of this implement, except that all the lashings are of rawhide instead of the fibre rope and twine of the South Sea Islanders. Their smooth lenticular stone for dressing skins also is the same as that in use among our Shoshones, and their "net-sinkers," grooved to be firmly fastened to the net, are just like those found everywhere. Several heavy cleavers of a tough schist and some of green stone are shown, in which one end is whittled down for a handle; and some heavy weapons of somewhat similar shape denominated "adzes," which are difficult to describe briefly. These have a style about them, however, which marks them as peculiar to that region. No arrow-heads and but few "flints" are exhibited. There are several carvings in wood, especially of human figures labeled idols, which wear immense headdresses like tiaras; and some other curious articles of wood, the use of which is not stated or apparent. The collection is well worth a careful study, as it is very suggestive. For a great variety of carving in wood, slate and horn, and some curious knick-knacks, the visitor should examine the display of native wares and work from the "Gold Coast" in Western Africa. This is not far from New Zealand's department, and should by no means be forgotten.

THE CAMBRIDGE MUSEUM.—By an act of the Massachusetts Legislature Prof. Agassiz's Museum of Comparative Zoology at Cambridge has been transferred from the Trustees who for seventeen years have guarded it, to the custody of Harvard University. It is a great addition to the resources of the university. The corporation previously owned the land, and now possesses all the property, including the rare and valuable collections, with $115,000 in money. The Agassiz Memorial Fund, amounting to $310,-673, is also a part of the transfer. All the scientific courses in geology, zoology, anatomy, and physiology are now taught in the Museum, and though students have no longer the advantage of Prof. Agassiz's genial and magnetic presence, they have the use of the abundant collections he gathered, with able teachers to expound them. With this great accession to its resources, the scientific course will become one of the most valuable in the whole university.

THE CENTENNIAL REGATTAS.—The Centennial regattas have been sailed, two in this harbor and one to Cape May and back, during the past week. They also have proved to be mere local affairs, only New York yachts competing. Not only did foreign yachts fail to put in an appearance, but even Boston and Philadelphia were unrepresented. In the first day's race *four* of our large yachts competed. The cause of so little interest being taken in these events is probably owing, first, to the absence of any incentive in the way of a valuable prize, for, although the possession of a bronze Centennial medal may be esteemed highly by the owner of a yacht, a valuable prize of plate would be much more desirable. So far everything undertaken by the Centennial Commissioners outside of their own grounds appears to have been to a greater or less extent failures.

—The Crossman House at Alexandria Bay, River St. Lawrence, will this season have attached to it two steam pleasure yachts, one of which (when not specially chartered) will make two trips daily between the bay and Brockville, a model Canadian town, 24 miles down the river, now styled the "City of the Thousand Islands," which is well worth visiting. The trip is a delightful one, through a magnificent portion of river scenery. The other little steamer will leave the bay in the morning, and call at the occupied islands, carrying a variety of the necessities and luxuries of life, also daily papers, island mails, express parcels, passengers, &c. This arrangement will be found a great convenience to the islanders. Either boat may be chartered by private parties on reasonable terms.

—The magnificent fleet of two schooners and two sloops started on the third "Centennial" regatta, the course being to Cape May and return. Evidently bronze medals and memorial certificates are not sufficiently attractive to induce yachtsmen to fit out for an outside race. The prizes for the four-oared shell race at Philadelphia are $2,500 to first boat, and $1,000 to second. Some such amount invested in plate might have made the sailing regattas worthy of the name.

THE FLORIDA NEW YORKER.—A paper with the above title has been established in this city, its object being to promote the interests of Florida in this State, to encourage emigration, and furnish all news and information requisite for tourists or intending settlers. The publication office is at No. 22 Beekman street.

TO GO WEST FOR A HUNT.—We call attention to the advertisement elsewhere of a reliable person who wishes to organize a few crack shots to hunt buffalo, elk, antelope, etc., next fall, in the southwest. Here is such a chance as seldom offers, where gentlemen can select their own comrades, not being obliged to depend upon guides and chance acquaintances on the frontier.

—A fine healthy place for ladies and children, with good fishing and shooting, at Sayville, Long Island, is advertised in our columns this week.

—Salmon in the Halifax, Nova Scotia, market, retail at 12 cents per pound.

Shot Gun and Rifle.

GAME NOW IN SEASON.

Woodcock, *Philohela minor*.

FOREST AND STREAM HANDBOOK FOR RIFLEMEN.—This neat little book is now ready for delivery and we can heartily recommend it as the most compact and concise handbook yet offered to riflemen. Its value will be more particularly felt by those who are forming new clubs, as it contains forms for regulations and by-laws, together with lists of all the paraphernalia required, and regulations for matches, etc. Besides "Hints to Amateur Riflemen," it contains a list of most of the American Rifle clubs. The illustrations comprise a map of Wimbledon, the greatest rifle range in the world, Glen Drake, canvas targets, score cards, etc. And the price is only 50 cents. Messrs. J. B. Ford & Co. are the publishers, but the book can be sent from this office.

CREEDMOOR.—Saturday was the regular match day at Creedmoor and the usual congregation of long and short range, civil and military experts was present. The most important match was that for the Geiger Bull's-eye trophy, shot for with 20 shots at 1,000 yards, 15 at 900, and 10 at 800 yards. The best score was made by Mr. L. Weber, 203 points out of a possible 225, but Mr. Farwell made one more bull's-eye and took the badge for the second time. The scores were as follows:—

Name.	1000 yds.	900 yds.	800 yds.	Total.
L. Weber, 23 bullseyes	87	67	49	203
G. W. Yale, 28 bullseyes	82	66	48	196
W. B. Farwell, 29 bullseyes	80	67	48	195
E. Bathbone, 22 bullseyes	78	63	47	188
E. Hyde, 19 bullseyes	72	62	46	180
C. E. Blydenburg, 22 bullseyes	69	64	36	179
C. E. Overbaugh, 23 bullseyes	59	69	49	177
Isaac L. Allen, 15 bullseyes	74	62	40	176
H. Fisher, 22 bullseyes	71	58	46	175
A. J. Roux, 23 bullseyes	58	67	50	175
G. L. Morse, 13 bullseyes	65	53	43	161
A. J. Hennion, Jr., 12 bullseyes	61	59	41	161
A. S. Swan, 8 bullseyes	36	55	38	129

In the other match for a marksman's badge, 5 shots each at 200 and 500 yards, Mr. A. B. Van Heuseu was the winner with a score of 41. There were 50 contestants.

THE THIRD MATCH WITH IRELAND.—For some reason or other our riflemen have displayed even less inclination to compete for the honor of representing their country in the approaching match with the Irish Team than they did in the competition for places in the general international matches. Tuesday and Wednesday of last week were the days fixed upon when sixteen experts were to be selected, who were to have competed again this week, when the final team and reserves would have been appointed. But only fourteen aspirants appeared so that none were excluded from the second contest, the details of which are not at hand in time for this issue of our paper. We give below the results of the two days competitions, the conditions being 15 shots each at 800 and 900 yards, and 20 at 1,000 yards, highest possible score:—

Name.	1st day.	2d day.	Total.
C. E. Blydenburg	218	159	377
Isaac L. Allen	213	196	409
G. W. Yale	209	212	421
G. W. Davison	205	174	379
A. Anderson	203	156	359
R. Rathbone	201	193	394
Major Henry Fulton	199	209	408
C. Dusenberry, Jr.	196	188	384
A. V. Canfield, Jr.	195	187	382
A. D. Hodgman	182	200	382
H. Fisher	180	184	364
Capt. Douglas Smyth	180	166	346
G. L. Morse	153	144	297
T. Lamb, Jr	Absent.	199	199

The second day was a very unfavorable one for shooting which accounts for the poor score. Mr. C. E. Blydenburgh, who had headed the list on the first day was unfortunate on the second in accidentally disarranging the front sight of his rifle. Mr. T. Lamb, Jr., being unable to attend on Tuesday, will be allowed another day in which to make his score. The following marksmen abide by their scores made in the competitions for places on the Centennial team: Lieut. Col. Farwell, Major Gen. Dakin, Messrs. L. Weber, C. E. Overbaugh, and L. C. Bruce.

We are able now to compare the practice scores of the Irishmen with our own, and the result as shown from the following table indicates that they are better than ours. The first of the series of competitions for places on the Irish team was concluded on the 10th inst., at Dundalk, and ten men selected for the final competition to be shot on the 28th and 29th inst. At this last competition Major Leech, Captain of the team, is authorized to nominate four or more additional competitors, among whom will be Messrs. John Rigby, Milner, and Wilson. In examining the table below, it must be borne in mind that the number of shots fired at each range was fifteen, while in our competitions 20 shots were fired at the 1,000 yard range. The last column denotes the "selected" scores of two days:—

Johnson	183	186	192	378
Goff	182	—	194	376
Rigby, Wilham	190	177	—	367
Clarke	172	175	193	365
Joynt	169	185	175	360

Major Leech had a very narrow escape at the last competition. The markers being new to the work, Maj. Leech had gone up to the targets to instruct them. While he was engaged in washing out the bullet mark from target No. 2, one of the riflemen who was firing at No. 1, missed his own target and hit No, 2. The bullet splintered in the rebound, and some of the splinters penetrated Major Leech's hat, cutting the right forehead; others struck his face, contusing the left cheek for fully three inches immediately under the left eye. The eye narrowly escaped. The hat was quite riddled. The Major will have the sympathy of all riflemen in this country, and we rejoice sincerely that the accident was no worse.

—The members of the International team, which, by the way, should not be confounded with the other American team which is being organized for the purpose of shooting a match with the Irish team (why would not one team have answered?) have elected Gen. Shaler Captain of the team. Col. Gildersleeve was the first unanimous choice, but politely declined. Major Joseph Holland was chosen adjutant. The regular practice of the team will commence after July 4th.

MORSEMERE.—Mr. Charles Hodgman, of the Yonkers team, says the Yonkers *Gazette*, was successful on Thursday of last week, in making the largest run ever recorded in the annals of rifle shooting at 500 yards. The target was made in the presence of two other members of the team. The feat was thirty-eight shots at 500 yards in which he made 185 out of 190, Creedmoor count; or, 203 out of 228, Morsemere count. This latter count gives an extra point for all shots in a 11-inch cartou, within the Creedmoor hull's-eye of 22 inches. We print this score in full as a matter of record and curiosity: 4 6 5 5 6 6 6 5 4 5 4 5 5 5 5 5 4 5 6 6 6 5 6 6 6 6 6 6 6 6 5 5 4 6 6 6 5 6.

NEW YORK.—A match was shot on the 20th inst. at Reeseville, N. Y., on the range of the Reeseville Rifle Club between C. W. Rennell of that place and J. D. Wilkinson, of Plattsburgh, for the championship of Northern New York. The conditions of the match were, 25 shots each at 200 yards off-hand; old Wimbledon target, 8-inch hull's-eye and 16-centre. Wilkinson won by a score of 109 against 89—possible score 125. The scores were as follows:—

Name.	Score.	Total.
Wilkinson	5 4 4 4 5 4 4 3 4 4 5 5 5 5 5 4 4 4 5 5 5 4 4	109
Rennell	4 4 3 5 3 2 4 2 3 2 4 1 5 4 4 4 4 4 3 5 4 4 3 3 2	89

The winner used a Wilkinson rifle and Mr. Rennell a Winchester.

—The Brooklyn Rifle Association elected fifty-six members at their last meeting. General T. S. Dakin is President and Colonel B. E. Valentine Secretary of the Association.

WISCONSIN—*Milwaukee, June 22d.*—The fifth contest at 500 yards, for the Broadhead field glass prize began at Milwaukee on the 16th inst., but owing to bad weather, rain, fog, and drizzele, the shoot had to be postponed at the 8th round, and was resumed the 21st. The greater number of the competitors failed to put in a second appearance to finish their score, but the "rifle on the brain" ones were on hand and did the best they could. Fielding won the glass the second time, by getting in a centre to Bangs' inner. The score now stands, Bangs winner twice, Fielding twice, and Turner once. The next trial will probably settle the matter. Bangs thinks he has got a sure thing, and Fielding smiles all over. The following are the scores:—

Name.	Score.	Total.
Fielding	5 4 4 4 5 5 5 5 5 4 5 4 5 5 4	69
Bangs	3 5 5 4 4 5 4 5 4 5 5 5 5 5 5	69
Turner	5 5 5 3 4 5 4 5 5 4 4 5 4 5 5	68
Johnston	5 4 4 3 5 5 5 4 4 4 4 5 4 4 4	66

WAU WAU.

NORTH CAROLINA.—The members of the Wilmington Rifle Club shot a team match on the 20th instant, the prize being a gold medal for the best score, to be won three times. The following are the scores:—

TEAM NO. 1—200 YARDS.		TEAM NO. 2—200 YARDS.	
Name.	Total.	Name.	Total.
Fyfe	4 3 5 4 3 4 3 5 4 4 ..39	Crow	4 4 5 4 4 4 4 5 3 4 .41

CALIFORNIA.—The summer meeting of the California Rifle Association was held at San Bruno range on the 8th inst. The principal event was the Kellogg Challenge Cup match, for which there were 29 entries, the conditions being 5 shots each at 300 and 600 yards. The cup was won by Corporal Thos. E. Carsen with scores of 18 and 20 at each range, the next competitor being eight points behind him. The second event was a Regimental team match, shot with U. S. Springfield of .45 calibre. Two teams from the First and Second Regiments contended. The conditions were 10 shots each at 200 yards off-hand, ten men in each team. The First Regiment team won by a score of 386 to 347 points. Following this match, the best shot of each team, Capt. Burns and Lieut. Brockhoff fired five more shots each, under the same conditions, for the McCloud medal, Capt. Burns winning by a score of 20 to his opponent's 19. The last event was the Military short-range stakes, for which there were 42 entries, under the same conditions as the previous match, five shots each. The best scores were: A. P. Raye, 22; J. Robertson, 21; C. P. Le Breton, 21; J. P. Warren, 20; A. H. Henz, 19.

THE RIFLE ABROAD.—A dispatch dated London, June 24th, says that Scotland has won the International Rifle Challenge Trophy competed for at Edingburgh by the Scotch, English, and Irish twenties. Scotland scored 1,226, England, 1,201, and Ireland, 1,140.

CHICAGO RIFLE CLUB.

CHICAGO, June 19th, 1876.

EDITOR FOREST AND STREAM:—

Following are the scores made by the Chicago Rifle Club at their range at South Park Thursday, June 15th. Weather was very fine up to three P. M., afterwards very changeable, showery, &c. No sighting shots.

Name.	Distance.	Score.	Total.
O. C. Blackmer	800 yards	5 5 3 5 5 4 5 5 4 5 4 5 5 4 5 4— 69

Grand total			157

R. S. Thompson, 1000 yards only.....3 3 4 4 5 5 3 4 5 5 4 0 4 0 4— 54

On the 22d inst., under the same conditions Colonel Shaffer scored 172, Mr. Blackmer 167, Chas. Fuller 144, and J. W. Roberts 137.

A new rifle club is to be formed here this week. Will send you particulars in my next. A.

THE RIFLE IN CANADA.—At a meeting of the Council of the Dominion Rifle Association held at Ottawa on the 21st, it was arranged to hold the prize meeting on the 5th September and following days; it was decided to allow smallbore shooting only with Martini-Henris, which will be supplied to members by the Association. The following is a list of the matches to be shot: All-Comers Match, $360; Dominion of Canada Match, $425; Battalion Match, $340; McDougall Challenge Cup, value $200; Provincial Match, cash prize $150; London Merchants' Cup, value $1,000; Affiliated Association Match, $280; Governor General's prizes, gold, silver, and bronze medals; prizes for the highest aggregate scores, $155, with medals of the National Association and two field glasses; Wimbledon matches in two stages, $1,265.

Lieutenant Colonel Gzowski, President of the association, accompanied the Canadian team to Wimbledon, sailing from Quebec on the 24th inst. A Canadian trophy is to be offered for competition at Wimbledon this year.

—A Murray (Iowa) correspondent says that prairie chickens will be plenty in Iowa the coming season.

PIGEON MATCHES.

NEW YORK—*Penn Yan, June 24th.*—Six sportsmen went to the trap with ten birds each, 21 yards rise, 80 yards boundary, one barrel, with the following result:—

Name.	Total.	Name.	Total.
Pratt	10	Remer	8
South	10	Gilbert	8
Sheldon	8	Elmendorff	6

All used 1¼ oz. of shot, except Elmendorf, who used but an ounce. Smith used a 10-bore gun, all the others were smaller. Gilbert's gun was a muzzle-loader, the others were breech loaders.

MICHIGAN.—A match was shot at Ann Arbor on the 23d instant between the Plymouth and Ann Arbor clubs, resulting in a win for the first by two birds. The conditions were 10 birds each, 21 yards rise, 1½ ounces shot. The following are the scores:—

PLYMOUTH CLUB.		ANN ARBOR CLUB.	
Name.	Total.	Name.	Total.
M. Kenyon	10	Wm. Porter	5

CONCENTRATING CARTRIDGES.

LOWELL, MASS., June 19th, 1876.

EDITOR FOREST AND STREAM:—

The article by "Old Sportsman," on page 271 of current volume, leads me to relate a short trial with Kay's and Eley's concentrating cartridges and the common round pasteboard concentrators, which, I believe, are also made by Eley, and which for short please allow me to call "paper." Gun used is W. & C. Scott & Sons, 12 gauge, 7¾-pound, 28-inch barrel, not choke-bored; powder—3 drachms Hazard ducking No. 3. With 1 oz. Tatham's No. 7, which contains, I think, 294 pellets, I get from 100 to 114 shot inside 30 inch selected circle, 40 yards. The same shot was used with paper concentrator. The Eley were No. 6 shot (English, of course,) the Kay No. 7 (American, of course supposed, since Eley, counted, contained 270 pellets; one Kay, 308 pellets, or the large number of 128 in favor of Kay's. I used paper 36x40 inches, fired from rest, and and selected circle afterward 30-inch diameter. Results arranged in order of merit were: Paper concentrator, 147, 134, 109, 52; Eley cartridges, 154, 136, 82, 57; Kay, 134, 112, 109, 102. Reckoning by simple proportion it seems fair to assume that had Kay's contained as few pellets as Eley's, his (Kay's) figure would have been 91, 75, 74, 69 in whole numbers. Brass shells were used for Kay's, paper shells for others, and both printed directions carefully complied with. The paper concentrator gave best distribution in first two patterns, Eley's first pattern being next; all others were poor. If you have any trial to suggest with same shot cartridges, but otherwise different conditions, I have a few left and some leisure time, so call on. Comment would seem as needless as the results mentioned by "Old Sportsman." WANNALANCET.

HAYING—THE CROP.—From present appearance we are likely to have more than an average crop. With this promise before us it becomes us to look well to the securing of all the profit and advantages arising from this condition of things. A large majority, in their practice, seem to think that grass for grazing and grass for hay are two quite different things, and that while the first is the very best when kept rather closely grazed—not allowing any seed stalks to form—that the latter must send up seed stems, blossom, form seed, and often ripen, so as to scatter the seed before being harvested; such are greatly in error in the opinion of the writer.

Practical, as well as theoretical experiments, determine that grass in the blade holds a larger amount of the elements which go to build up all parts of the animal system than the same varieties after having passed the blossoming stage. Such being the fact, grass designed for hay ought to be harvested soon as, if not previous to, its blossoming. Many make it a practice to begin haying at a set time, say the Monday following the fourth of July; or perhaps somewhat later in this section; but there is a growing class who find it to their advantage to begin their haying earlier, and thus secure a richer and better feed for their stock, something which is not so far removed from green grass, the natural food for all herbiferous animals.

The harvesting of grass previous to its blossoming necessitates a considerably greater amount of labor, but is it not a fact that we are generally overwise in making hay by over-drying it? Hay will keep, and sweet, too, where there is no foreign moisture in it, or allowed to enter it after housing, if not so thoroughly dried before housing, always provided it is stored in tight, suitable buildings. Barns, as too commonly found, are apt to be poor places for storing cured grass, the wide cracks affording too free circulation. A barn to stow hay in should be a tight one, no cracks to admit air, sun, or wet to the mow to bleach and spoil the hay which lays contiguous to them.—*Germantown Telegraph.*

—Ten mules attached to a wagon loaded heavily with lumber went over a precipice near Virginia City, Nevada, and rolled down a nearly perpendicular bank two thousand feet to the bottom of a cañon. The driver, who saved his life by jumping off the wagon in time, says that he could see the tumbling animals during only several hundred feet of their fall, but after that a cloud of dust hid them, although he heard their agonized cries longer

Yachting and Boating.

THE CENTENNIAL REGATTAS.

THE first of these events was sailed on Thursday last over the regular New York Yacht Club course around the Light Ship and return. In number or entries it did not equal one of the regular club regattas, and the absence of any visiting yachts, either foreign or domestic, (except one small sloop from Boston), deprived it of anything approaching either a national or international character. The day was all that could be desired for a regatta, and the number of excursion steamers out unusually large. The contesting yachts were as follows:—

FIRST CLASS SCHOONERS.

Name.	Owner.	Club.	Allowance. M. S.
Rambler	W. H. Thomas	New York	Allows.
Dreadnaught	C. J. Osborn	New York	2 43
Tidal Wave	W. Voorhis	Atlantic	3 28
Alarm	G. L. Kingsland	New York	4 01

SECOND CLASS SCHOONERS.

Estelle	James D. Smith	New York	Allows.
Restless	J. N. Kane	New York	3 04
Meta	W. E. Iselin	New York	5 55
Peerless	J. R. Maxwell	Atlantic	6 08
Eva	E. Burd Grubb	New York	7 48

FIRST CLASS SLOOPS.

Gracie	J. R. Halsey	Brooklyn	Allows.
Arrow	Daniel Edgar	New York	2 50

SECOND CLASS SLOOPS.

Kate	George F. Randolph		Allows.
Windward	H. L. Willoughby	New York	0 11
Sadie	W. E. Greenleaf	Atlantic	1 41
Orion	Wm. Cooper	Atlantic	2 05
Annie	James Ellsworth	Brooklyn	2 36
Maggie B	C. S. Stratton	Brooklyn	5 14
Schemer	C. S. Lee	Seawanhaka	9 6
Pirate	W. Winant	Brooklyn	—
Whitecap	J. M. Forbes	Eastern	—

The signal to start was given at 11:22, but few of them showed a disposition to cross the line, the little sloop, Sadie, crossing first, followed by the Alarm and Gen. Tom Thumb's sloop, Maggie B. At 11:37 a number of the yachts had not crossed, but as their time was computed from the expiration of the fifteen minutes' allowance it was so much against them. The Whitecap, the only visiting yacht, carried away the head of her topmast just as she crossed the line, and was withdrawn. Both wind and tide were fair, and as they opened the bay the breeze was just fresh enough to bring out their sailing qualities. The Tidal Wave's misfortunes commenced early in the day, as soon after passing the Wadsworth her fore topmast broke short off, leaving her in as bad a plight as she was on the day of the New York Yacht Club regatta. The Alarm soon passed the little Sadie, and led the fleet, followed closely by the Gracie and Arrow, these three being the first to round the southwest spit buoy, in the order named, the Sadie and Maggie B. following. The others were not timed, as the judges' steamer was steered direct for the Light Ship. Passing the point of the Hook the Gracie was leading the Alarm, with the Arrow close up. The event of the day was the race between these two first class sloops. At the Light Ship they were side and side, but the Arrow managed to turn first, and started on the journey home. The large schooners, particularly the Dreadnaught, were doing well, with the exception of the Tidal Wave, which was next to the last vessel to turn the Light Ship. Coming home the Arrow maintained her lead of the Gracie, followed by the Dreadnaught, which had passed the Alarm, the others being strung out in a long line astern. The times of arrival and results of the race were as follows:—

FIRST CLASS SCHOONERS.

Name.	Start. H. M. S.	Finish. H. M. S.	Elapsed time. H. M. S.	Corrected time. H. M. S.
Dreadnaught	11 37 00	4 15 40	4 38 40	4 35 57
Rambler	11 37 00	4 29 40	4 52 40	4 52 40
Alarm	11 25 41	4 23 28	4 57 47	4 55 43
Tidal Wave	11 37 00	4 35 04	4 58 04	4 54 56

SECOND CLASS SCHOONERS.

Estelle	11 37 00	4 31 15	4 54 15	4 54 15
Restless	11 30 14	4 43 16	5 13 02	5 09 58
Meta	11 37 09	4 45 42	5 08 33	5 02 37
Peerless	11 35 42	4 32 50	4 57 08	4 51 02
Eva	11 37 00	4 43 53	5 06 53	4 59 05

FIRST CLASS SLOOPS.

Gracie	11 37 25	4 15 24	4 47 58	4 47 58
Arrow	11 28 08	4 08 15	4 40 07	4 37 17

SECOND CLASS SLOOPS.

Orion	11 37 00	4 42 48	5 05 48	5 03 43
Windward	11 37 00	4 41 34	5 04 34	5 01 23
Kate	11 29 11	4 33 37	5 14 26	5 14 26
Sadie	11 24 37	4 1 01	5 16 24	5 14 43
Annie	11 37 00	4 48 12	5 11 12	5 08 35
Maggie B	11 26 12	4 40 47	5 14 35	5 09 28
Schemer	11 30 20	4 52 42	5 16 23	5 07 16
Pirate	11 32 50	not timed.		

Thus the Dreadnaught wins the first class schooner prize, beating the Rambler 16m. 43s. The Peerless wins in the second class in schooners, beating the Estelle 3m. 18s. The Arrow wins in the first class sloops, beating the Gracie 10m. 41s., and the Orion wins in the second class in sloops, beating the Windward 40s.

THE SECOND DAY.

Friday was even a fairer day for a regatta than the one preceding, and the immense number of small yachts afloat gave the bay a decidedly holiday appearance. Entries were confined to yachts of fifteen tons and under, thirty-one appearing at the starting point. These were divided into three classes, the first comprising all cabin yachts, the second, open boats of 25 feet mean length and over, the third, boats under 25 feet, and the fourth, all cat-rigged boats. The course was from a stake-boat off the New York Yacht Club house to and around a stake-boat off Coney Island; thence to and around a stake-boat off Bay Ridge; thence to and around a stake-boat off Robbins' Reef; thence returning to the home stake-boat; and thence over the same course again, keeping all stake-boats on the port hand, in passing and rounding them. The prizes offered were a medal and diploma of the International Exhibition of 1876 for the winner in each class, as well as a silver prize offered by the Centennial Regatta Committee. At 12h. 12m. 20s., the gun to prepare was fired from the yacht Restless, and five minutes later the gun to start was fired. The Cynthia was the first to cross, followed closely by the Maud and Beecher. With such a large fleet there were constant changes, yachts passing and repassing each other in making the two rounds of the course. Among those which most distinguished themselves by fine sailing were the W. T. Lee, the Pluck and Luck, and the Susie S. The sensation of the day, however, was the appearance of the noudescript life raft, or "What is it?" called the Amaryllis, a double boat composed of two cigar-shaped cylinders about four feet apart joined by light planking. The way in which she sailed was a "caution" and opened the eyes of the yachtsmen. She led the fleet to the home stake-boat by a mile. The following table gives the names of the yachts entered, and the results:—

FIRST CLASS SLOOPS.

Name.	Start. H. M. S.	Finish. H. M. S.	Actual time. H. M. S.	Corrected time. H. M. S.
Favorita	12 21 20	4 15 28	3 54 08	3 54 8

Almira	12 27 59	4 28 40	3 54 41	3 49 21
Sophie Emma	12 26 08	4 28 08	4 02 00	3 56 00
Addie Taylor	12 25 29	4 19 42	3 54 13	3 48 03
Tough	12 25 38	Withdrawn.		

FOURTH CLASS SLOOPS.

Rebecca	12 21 05	Withdrawn.		
Knight Templar	12 26 00	4 06 40	3 41 49	3 33 49
Cynthia	12 18 40	3 55 50	3 37 10	3 37 10
Fidget	12 20 41	4 19 22	3 58 41	3 46 31
Florence	12 20 33	4 11 06	3 50 33	3 37 43
Victoria	12 23 33	4 03 45	3 40 12	3 27 02
Fonthill	12 20 55	4 22 55	4 02 00	3 47 50
H. W. Beecher	12 19 38	3 58 20	3 35 42	3 28 32
Vanita	12 21 38	Withdrawn.		
Maud	12 19 05	Withdrawn.		

The Reveille thus wins the prize for the first class, beating the Favorita 12m. 1s. The Susie S. wins that for the second class, beating the W. R. Brown 3m. 26s. The Amaryllis won the third class prize, beating the Pluck and Luck, the next vessel in this class, 20m. 2., but there was a protest entered against giving her the prize, on the ground that she is not a yacht, and the judges decided against her, giving the prize to the Pluck and Luck. The prize for fourth class was won by the Victoria on the time allowance, beating the Cynthia 8s. and the H. W. Beecher 1m.

THE THIRD DAY.

The third and last of the regattas under the auspices of the Centennial Commissioners, which is to be a race from Sandy Hook to Cape May and return, was begun on Monday, the starters being the schooners America and Alarm, and sloops Arrow and Gracie. The wind was light also at Sandy Hook, and when the hour arrived to start the yachts there was hardly sufficient breeze to fill the sails of the departing vessels. At one o'clock a slight breeze sprang up from the eastward, and at 1:19.5 the Gracie was started off to seaward from Buoy No. 5 off the point of Sandy Hook, followed at 1:28:45 by the Arrow. Both went away on the starboard tack, and making a short stretch, went about on the port tack, in which direction they were going when they passed out of sight, the Gracie still ahead. At 2:12:30 the Alarm passed by the stake-boat, also on the starboard tack, followed by the America at 2:13, both of them, however, passing the wrong side of the stake-boat. They were allowed to proceed, however, and when last seen they were still heading off shore, the Alarm leading the America about a mile. At the time of our going to press the yachts have not been heard from.

HUDSON RIVER YACHT CLUB.—Monday last was the day fixed for the Union regatta held under the auspices of the above club, but the luck which during the earlier part of the season had favored yachtsmen seemed now to have deserted them, and on Wednesday in almost utter absence of wind marred what might have been made a most successful regatta. After waiting for a breeze until one o'clock the starting gun was fired and the yachts named in the summary below were started on what proved to be a mere drifting match. The start was a flying one, and the course from the foot of Seventieth street up the North River to Pleasant Valley, thence down to Wechawken, and thence past the stake-boat at Seventieth street, the course to be sailed over twice. The time limit was five hours, and the leading yachts managed to get around the course within that time and make a race. The following is a summary:—

FIRST CLASS.

Name.	Start. H. M. S.	Finish. H. M. S.	Actual time. H. M. S.	Corrected time. H. M. S.
Foulton	1 13 15	Withdrawn.		
Eureka	1 12 00	6 09 45	4 57 45	4 57 45

SECOND CLASS.

Addie Taylor	1 16 00	6 14 30	4 28 30	4 55 30
H. H. Holmes	1 14 30	6 30 00	5 15 30	5 13 30
Vision	1 16 15	5 41 25	5 25 10	5 19 00
Clara S	1 14 30	Withdrawn.		
Annie L	1 15 33	Not timed.		
Pilot Boy	1 13 15	6 46 10	5 28 55	5 28 35
Andrew Blessing	1 15 10	Withdrawn.		
Au Revoir	1 11 30	6 14 40	5 03 10	5 01 50
Artful Dodger	1 10 00	6 09 30	4 53 30	4 53 30

THIRD CLASS.

K. Joralemon	1 13 00	Withdrawn.		
Skip Jack	1 18 00	7 01 30	4 53 30	4 53 30
Tough	1 13 00	7 00 15	5 47 15	5 31 55
Onward	1 15 00	Withdrawn.		
Mary Allen	1 13 00	Not timed.		
Gussie	1 14 00	Withdrawn.		
Ella	1 14 00	Withdrawn.		
Wave	1 16 30	7 03 10	5 56 40	5 58 50

The prize was a handsome gold medal to the winner in each class, which is won by the Eureka in the first class, the Addie Taylor in the second class, and the Tough in the third class.

QUINCY YACHT CLUB REGATTA.—The first championship regatta of the Quincy Yacht Club took place off Mear's Hotel, Quincy Great Hill, Saturday afternoon. The judges were E. B. Souther, Chas. H. Porter, and J. O. Holden, and the courses were:—

First and Second Classes—From the judges' yacht, passing between Sheep and Grape Islands to red buoy, between Bunkin Island and Downer's Landing, leaving it on the port; thence, leaving Bunkin Island on the starboard, to red buoy off Hull, leaving it on the port; thence, leaving Sheep Island on the port, to Jacknife Ledge, leaving it on the starboard; thence, leaving Raccoon Island on the port, to judges' yach, passing between it and a flag-boat. Length, 7½ miles.

Third Class—From the judges' yacht, passing between Sheep and Grape Islands, to red buoy between Bundin Island and Downer's Landing, leaving it on the port; thence, leaving Bunkin Island on the starboard, to red buoy off Hull, leaving it oo the port; thence, leaving Sheep Island on the port, to judges' yacht, passing between it and a flag-boat. Length, 6 miles. The following is the summary:—

FIRST CLASS.

Name.	Master.	Length. ft in.	Actual time. H. M. S.	Corrected time. H. M. S.
1. Nerdie	S. F. Whitmarsh	28 5	1 20 30	1 35 10
4. Indie	E. W. French	29 2	1 23 10	1 39 06
3. Fiona	H. W. Barker	27 4	1 21 50	1 38 15
— Secret	J. Binney	23 2½	Not taken.	
2. Vision	E. P. Worster	27 7½	1 22 12	1 36 01

SECOND CLASS.

3. Maleio	James H Slade	19 9	1 28 28	1 41 02
4. Aurora	C. Sharp, Jr	19 4	1 42 07	1 43 51
1. Flora	W. F. Mayhury	17 3	1 30 00	1 32 25
2. Wildfire	H. A. Keith	18 1	1 37 24	1 36 29

THIRD CLASS.

4. Red Lion	G. W. Morton	16 8	1 26 57	1 23 21
7. Emer	F. Chubbuck, Jr	16 8	1 32 57	1 29 21
5. Rocket	B. F. Bass	16 6	1 28 08	1 24 11
3. Kate	George Saville	16 6	1 26 00	1 22 03
6. Rescue	W. F. Ford	15 8	1 35 23	1 29 19
1. Polly Virden	A. B. Cleverly	16 8	1 31 37	1 31 41
1. Fannie	A. Cleverly	16 7½	1 32 45	1 19 04
8. Annie	P. B. Turner	17 0	1 33 32	1 29 39

THE COUNTESS DUFFERIN.—This yacht, which is to contend in our waters next month for the possession of the "America" cup, has been given a good trial on Lake Ontario, and one that was eminently successful. Capt. Cuthbert says:—"She is the smartest vessel on fresh water. She runs like a witch, and has actually traveled over sixteen miles an hour, once, I believe, touching twenty. She also sails close to the wind, she is a good sea boat, stiff and easily worked, and will steer under her mainsail alone." He says, "I have great hopes of success in the coming race, as I know what the Countess can do, and was previously aware of what the crack American yachts were capable of. We carry a crew of eight, and have no trouble in handling her." Capt. Cuthbert may find that some of the crack American yachts can do more than he imagines. Still the Countess is likely to be a hard one to beat. She is said to have been modeled by Capt. Joe Ellsworth, who modeled the Comet, and sails her in all her races, and Pat McGiehan, builder of some of our fastest yachts. Capt. Joe Ellsworth will sail her, which is a strong point in her favor. She was to have sailed Monday week for Quebec and sea.

THE MADELEINE TO SAIL FOR THE AMERICA CUP.—The regatta committee of the N. Y. Yacht Club held a meeting last week, when it was unanimously resolved that the schooner Madeleine, by virtue of her previous record, and of her recent performance in trials with other yachts, was the fittest vessel to be chosen to represent the club in this international contest, and that, therefore, she should be chosen to sail these races.

It is understood, unofficially, that the club will take upon itself the sole charge of fitting the yacht for this contest, deeming it a club affair entirely, and if the permission of Commodore Dickerson can be obtained for such an arrangement, the club will, for the purposes of this race, assume the absolute ownership of the yacht, and relieve him from all responsibility, so that if she wins it shall be a club victory, and if she is defeated the club will take all the blame.

—Mr. Charles Carman's new yacht Carrie, 27 feet, arrived in Barnegat waters on the 21st inst. She is entered in the race of the Toms River Yacht Club, on July 5th.

BOSTON YACHTING MATTERS.—The Boston Yacht Club had a review on Saturday last, the rendezvous being the Club House, City Point. Between 30 and 40 yachts were anchored in line according to class, and inspected by the Commodore in his steam launch. Each yacht saluted by colors and gun as the Commodore passed her stern. The Commodore on completion of his inspection returned to his yacht, moved and located her, and then fired a gun. At this signal the first class yachts got under way, and in single file passed close to the stern of the Commodore's yacht, saluting when passing, with colors and gun, and thence held their course to the Great Brewster. At the signal of a second gun the second class boats followed in the same order, and the fleet took the course down the bay.

A tempest visited Boston Bay on Sunday doing much damage. 250 sail of yachts were anchored in Dorchester Bay, of which number half a dozen were capsized.

EASTERN YACHTING.—Saturday week was a great day for yachts in Boston Bay. The Dorchester and Lynn yacht clubs had their regattas, and the Quincy, Bunker Hill, Haverhill, and East Boston clubs all had regattas or reviews. The West End Boat Club had a regatta on the Charles River, where T. C. Butler and M. J. Abern rowed a single-scull race of two miles for the club championship, Butler winning in 16m. 25s. There were also pair-oar and four-oar working boat races.

THE FOURTH IN BOSTON.—Boston will celebrate the Centennial holiday in the usual manner with regattas on the bay and on the Charles river. There will be four sailing races, with prizes ranging from $100 to $25. Also four rowing races, the principal of which is that for four-oared boats, distance six miles: first prize $500; second, $350. The total amount given for prizes in the rowing races is $1,625.

ALCYONE BOAT CLUB.—The seventeenth annual regatta of this Brooklyn Club was held on the Hudson river near Yonkers on Saturday afternoon. For the pair-oared race there were two starters, as follows:—The Curlew, colors light-blue; bow, Sidney Greene, Jr.; stroke, Wm. C. Howard. The Petrel, colors red and white: bow, Henry J. Barlow; stroke, Lewis Smitzer, Jr. The course was two miles straight away from Huyler's Landing to Excelsior Grove. The "reds" took the lead at the start and kept it for the first eighth of a mile, when Barlow began steering across the river and directly out of the course. The "blues" soon passed the "reds," and won the race in 12m. 12½s., two and one half lengths ahead of the "reds."

The entries for the gig race were as follows:—The "Cigarette, colors blue: bow, Chas. C. Blossom; 2d, Wm. C. Cromwell; 3d, Thos. G. Wells; stroke, John C. Burne; cox, A. H. Supper. The Flirt, colors red: bow, J. J. Halhalan; 2d, Ed. P. Whipple; 3d, Wm. J. Oliver; stroke, A. H. Waterhouse; cox., Wm. V. Supper. The "blues" took the lead, leaving the "reds" at the first quarter-mile over a length behind. This lead they increased to the finish, crossing the line five lengths ahead. Time, 12m. 51½s.; reds, 13m. 3½s.

A tub race wound up the proceedings.

SCHUYLKILL NOTES.—The single-scull race for the championship of the Schuylkill Navy, which was postponed from the regular regatta day, Saturday last, on account of the rough water, was rowed on Tuesday the 20th. The starters were five in number, and were allotted stations at the start in the following order, beginning with the Western, or canal bank station: W. G. Thomas, Penn. Sylvania Club; Samuel Gormley, Quaker City; John D. McBeath, Quaker City; F. W. Street, Pennsylvania, and Chas P. Tasker, Crescent. The umpire, Mr. Alex Krumbhaar, of the Philadelphia, gave the men a good send off; Gomley getting perhaps a trifle the best of it. On the east, Street shot out of the line at a pace that could not possibly last, and which before a mile was rowed, sent him to the rear guard. Thomas with more vim than judgment, pushed for a lead on the west, and succeeded in slightly heading Gormley, who was until now ahead of all except possibly young Street. Thomas' pace was at the cost of form, and his steering got wild. Gormley was forced to spurt to prevent a collision, and his oars lapped with Thomas', causing the latter to claim a foul, a great loss of time, as the claim was justly not allowed. When he again got straightened out, he and McBeath were crowding one another; their oars struck slightly; John caught a crab, claimed a foul, which was allowed; and before he got away again, seeing the impossibility of ever catching Gormley—who was in the meantime getting away fast—virtually gave it up, coming down in company with Street. The race was now between Tasker, Thomas, and Gormley. The Quaker City man at the mile was showing the way; the other two a couple of lengths behind him, making a good race for second place. Thomas rowed pluckily but the better shape of the Crescent's sculler showed at the head of the Island that he meant to be second, indeed, it looked as if he might get very close to first place, but the result was Gormley, 1st, 10m. 24s.; Tasker, 2d, 10m. 40s.; Thomas, 3d, 10m. 52½. No time was taken for Street, or for the ex-champion, McBeath. On the umpire's steamer, which was kindly placed at the Navy's disposal for the race by Capt. Markle, of the Fairmount Steamboat Co., were the time-keepers, the Regatta Committee, members of the Naval Board and a number of guests, among whom was Mr. Chas. Hallock, the editor of FOREST AND STREAM. Much is due from the Navy for the consideration of Capt. Markle, who is always ready to assist in making regattas successful, by arranging the running time of his steamers in such a manner that they seldom interfere with the races.

SCULLS.

THE YALE-CAMBRIDGE RACE.—To-morrow the first eight-oared race ever witnessed in American waters will be rowed on the Connecticut River at Springfield. The contestants are the picked crews of Yale and Harvard, and is to a great extent a trial of the Oxford stroke adopted by Yale against the old Harvard stroke, rowed by Mr. Lonng and his companions when they were defeated in England some years since. The crews are as follows:—

CAMBRIDGE.			YALE.		
Name.	Age.	Wt.	Name.	Age.	Wt.
Stroke, W. A. Bancroft	21	157	Stroke, R. J. Cook	27	154
7—J. C. Belmn	23	157	7—J. Kennedy	24	166
6—M. James	21	169	6—O. D. Thompson	21	164
5—W. M. Lemoyne	19	169	5—W. W. Collin	20	169
4—W. R. Jacobs	19	160	4—H. Kellogg	22	157
3—E. D. Thayer	19	156	3—R. C. Cook	23	161
2—G. W. Ewing	22	154½	2—F. Wood	22	151

Average	20¼	160	Average	23	158½

Rational Pastimes.

CRICKET.

—On Saturday the Germantown and Philadelphia Cricket Clubs played a one-day's match at the grounds at Nicetown. The result was a handsome victory for the Germantown by a score 178 to 126. The playing in this, as in all matches here, so far this season, shows decided improvement. For the Philadelphias Magee ran up a score of 54 runs; Sartori made 14, and Law 22. The double figures for the Germantowns were: Hoffman, 280; Bob Hargreaves, 22; Large, 15; Welsh, 11; and Tom Hargreaves, who went out for no less than 62, made up of two fours, four threes, ten twos, and twenty-two singles.

On Monday, June 26th, the St. Georges of New York played the Young America at the same grounds, and suffered rather a disastrous defeat. The St Georges went to the bat first, and suffered terribly from Dan Newhall's slows. Eight of the wickets were credited to Dan's bowling. The only double figure was Banco's 28; Giles' 8 was next best.

Both the bowling and fielding of the Young America in this inning were very fine. When the Young Americas went to the bat they made things lively. Geo. Newhall made 47; Dan Newhall, 22; Baird, 26; and H. Newhall, 34 by hard hitting. Large made a stand for 90 and carried his bat out. He was in so firmly that had not the stumps been drawn, as they were at seven o'clock, a century was almost certain. C. Newhall's 19 (not out), were made by good batting. The strong defense greatly discouraged the bowlers, whose work was nevertiteless good. The St. Georges' fielding was loose, many chances being missed. The score of the St. George's was 56; of the Young America's, 249, winning the match by 193 runs and 5 wickets to fall. The Germantown's and St. George will play on Tuesday, June 27th.

SCULLS.

ST. GEORGE VS. ST. PAUL.—The School team of St. Paul's Academy of Concord had a game on June 24th with the St. George second eleven, and the latter were defeated by 200 to 68. Messrs. Borie and Conover led the score with 44 and 39 respectively. G. Giles, Jr., scored 20 for the St. George's, making three fine drives, and F. Satterthwaite, the captain, did well, with 14 not out. The wicket keeping of A. Gracie, for St. Paul's School, was much admired, and the sharp fielding of the team elicited repeated applause.

ST. GEORGE VS. STATEN ISLAND.—On June 20th these clubs played a first-eleven match together at Hoboken, the result being the success of the St. George team by nine wickets. The score was, St. George, 56 and 26—82, and Staten Island, 45 and 46—81. Jones' 21, and Moeran's 12, were the best scores in the first innings, and Giles' 17, not out in the second, on the part of St. George. Moore, Brewster and Williams alone scored double figures on the other side. Brewster led in the bowling on one side, and Moeran on the other.

MANHATTAN VS. BROOKLYN.—These clubs played a one-innings game together at Prospect Park on June 20th, which resulted in the success of the Manhattans by 118 in one innings, to 14 and 19—33. Robert's 26, Hooper's 24, and Greig's 18 cover the leading scores on the Manhattan side, Scott's 13 being the only double figure seore on the other. Roberts and Ames led in the bowling.

BASE BALL.

—The first week's play of the western tour of the eastern nines of the League Association ended in favor of the west, all of the eastern nines sustaining defeat except the Bostons, as the appended record shows:—

Chicago vs. Mutuel	4	2	St. Louis vs. Athlatic	4	2
Chicago vs. Mutuel	6	4	St. Louis vs. Athletic	5	0
Chicago vs. Mutuel	16	2	St. Louis vs. Athletic	8	3
Total	26	8	Total	17	5
Louisville vs. Hartford	5	8	Bosloo vs. Cincinnati	14	7
Louisville vs. Hartford	0	3	Boston vs. Cincinnati	8	6
Louisville vs. Hartford	7	2	Boston vs. Cincinnati	8	7
Total	12	10	Total	30	19

This week the Mutuals play in St. Louis, the Athletics in Chicago, the Hartfords in Cincinnati, and the Bostons in Louisville. The pennant record to June 25th, inclusive, is as follows:—

Clubs.	Games Played.	Games Won.	Games Lost.	Games Drawn.
Chicago	27	23	4	0
Hartford	24	19	5	1
St. Louis	27	17	10	0
Boston	27	13	14	0
Louisville	26	11	15	2
Mutual	26	10	16	0
Athletic	26	8	18	1
Cincinnati	27	4	23	0
Total	210	105	105	4

The following are the model games won by five runs and less since our last issue. We give them in the order of smallest scores:—

June 17—Hartford vs. Louisville, at Hartford	1 to 0
June 22—Brooklyn vs. Alaska, at Jersey City	2 to 0
June 16—Fall River vs. Taunton, at Fall River (10 in.)	2 to 1
June 17—Capital City vs. Philadelphia, at Indianaputis	2 to 1
June 21—Fall River vs. Rhode Island, at Taunton	2 to 1
June 24—Hertford vs. Louisville, at Louisville	2 to 0
June 22—Now Haven vs. Princeton, at Princeton	3 to 1
June 19—Live Oak vs. Harvard, at Lyno	3 to 2
June 19—Star vs. Cricket, at Syracuse	4 to 2
June 20—St. Louis vs. Athletic, at St. Louis	4 to 2
June 23—Chicago vs. Mutual, at Chicagu	4 to 2
June 20—Live Oak vs. Lowell, at Lynn	4 to 2
June 20—Lone Star vs. Our Boys, at Brooklyn	4 to 3
June 21—Taunton vs. Lowell, at Lowell	4 to 3
June 23—Rhode Island vs. Lowell, at Lowell	4 to 3
June 22—St. Loois vs. Athletic, at St. Loals	5 to 0
June 21—New Haven vs. Resolute, at Elizabeth	5 to 2
June 20—Goodwill vs. Athletic, at Brooklyn	5 to 3
June 17—Harverd vs. Tsonton, at Taunton	5 to 4

AMATEUR ATHLETIC HANDICAP MEETING.—A meeting of this description, under the auspices and management of Mr. Alfred H. Curtis and Mr. James Watson, will be held at the New York Athletic Club Grounds, Mott Haven, on Saturday, July 29th. The programme is as follows, unless circumstances require or suggest any alteration:—

1st—100 yards, trial heats; 2d, one mile; 3d, 100 yards, 2d, trial heats; 3d, two-mile walk; 4th, 440 yards; 5th, 100 yards, final heat.

The prizes will be gold medals to first and second, and a silver medal to the third in the 100 yards, If the entries for the other games warrant it, third prizes will also be given. Entrance fee $3 for each event, which will be returned to all those who go over the full course. Those entitled to start in the final heat of the 100 yards, if entered in the 440 yards will have their entrance fee returned in case they choose to withdraw from the latter. No competitor will be allowed to enter under a false name, and the right to refuse any entry is reserved. Entries, with entrance fee accompanying, will be received up to 3 o'clock P. M. Saturday, July 22d, by A. H. Curtis, P. O. box 2003, New York.

EDITOR FOREST AND STREAM:—The regular commencement meeting of the Princeton Athletic Club took place on the 24th inst. Two prizes were offered for each game, and a general prize, which was won by Andrew McCosh, '77, youngest son of our worthy President. Below is a summary:—

One Hundred Yard Dash.—Hunt, '78, winner; time, 11s.

Standing Long Jump.—Larkin, '79, 9ft. 8¼in.

Mile Walk.—Noble, '76, winner; time, 2.34.

Throwing Baso Ball.—Denny '77, (catcher of University nine), 376ft. 4in.

Quarter-Mile Run.—Halstead, '77; time, 1.01 3-5.

Putting 16 Pound Shot.—Larkin, '79; 31ft 2in.

Pole Vaulting.—McCosh, '77; height, 8ft. 8in.

Running Long Jump.—L. G. Walker, '76; 19ft.

Half-Milo Run.—Phraner, '78; time, 2.28½.

Running High Jump.—McCosh. '77; 5ft. 1in.

Three-Legged Race.—Halstead and McCosh, '77.

Throwing Hammer.—Mann, '76; 74ft. 11in.

Hurdle Race—100 Yards.—Woods, '76; time, 20s.

Mile Run.—Greene, '78; time, 5.15½.

McCosh won the general prize by taking second in a large number of these games.

LOUNGER.

PHILADELPHIA, June 24th, 1876.

EDITOR FOREST AND STREAM:—

Some weeks ago a swimming contest was proposed and organized, open to members of the Schuylkill Navy. To-day the swim was had on Flat Rock Dam, a course excellent for the purpose, as it would also be for boat racing for three miles. The first race was for 300 yards down. Hunnecker, of the Malta, and Gormley, Pleasonton and Bryant, of the Quaker City, started, diving from the umpire's boat at the signal. Bryant, after a long swim under water showed up well in front, but the others soon passed him, and he gave it up. Gormley won easily in 4 minutes and 57 seconds; Pleasonton, second, 5 minutes and 20 seconds; Hunnecker, 5 minutes and 35 seconds. The steamer then went to the head of the course at Spring Mill, and Douglass, of the Undine; Belisario, West Philadelphia; and Lea, of the Philadelphia Club, started for the three-mile swim. It seemed a long distance and the water was cold, but with almost no current. Odds were offered that the men, except Lea, could not do it.

A good start was had, all getting into the water together. Douglass went at once to the front, Belisario following at an easy pace, and Lea dropping away behind, with the evident intention of lasting, and the expectation that the other two would give out before the finish. At a mile Douglass led Belisario a hundred yards, with Lea almost half a mile astern. At two miles Belisario spurted and got within twenty yards of his leader, but was not able to get closer. Douglass, who swam clear through in fine form, never having turned his head or altered his stroke, won in 1 hour, 53 minutes and 30 seconds. Belisario, seeing it impossible to win, left the water a couple of hundred yards from the finish. Lee came to the finish, but so far behind that no time was taken.

In the mile race Raby, of the University crew, Pleasonton, of the Quakers, and Miller, of the Undine, started. Miller won with ease in 29 minutes and 58 seconds. Pleasonton and Raby made a struggle for second place, Pleasonton getting it by a neck in 43 minutes. The winners will each receive a handsome gold medal, and Mr. Douglass will hold the swimming championship of the Navy for one year. These contests are a new feature in our sports here, and enlist an interest which they well merit.

SCULLS.

BOOKS RECEIVED.

PEABODY MUSEUM OF AMERICAN ARCHÆOLOGY; Ninth Annual Report; Cambridge, Mass.

The reports of this institution are always of great interest. Many additions have been made to the museum during the year, the most important being that from Peru and Bullvin collected by Mr. Alex. Agassiz, by whom it was presented. It consists of 538 articles, including "mummies" and bodies in jars, illustrating the peculiar burial customs of the ancient Peruvians; vessels of various patterns, and idols of pottery and terra cotta; articles of clothing and pieces of various textures and designs; tbread, spindles and other articles connected with weaving; work-boxes of finely split reeds; ornaments and bends of silver, copper, shell and stone; fishing nets; combs; head-dresses of feathers; fragments of bows and arrow-heads, which are of special interest because the bow and arrow are not in use among the present Peruvians; and a large amount of ancient pottery. Mr. Agassiz secured besides this many articles of use among the modern Indians who are dying out. Collections have also been received from Mr. Schomecher's Explorations on the Coast of California; from Dr. Parry's researches in Southern Utah, indicating that the ancient inhabitants of that region practiced cremation; from Dr. C. C. Abbott of the paleolithic implements from Trenton, N. J., to which allusion was made in our notice of the *American Naturalist* last week; and from several other persons. The prosperity of the museum is set forth in the report of the treasurer, who states that the fund has now reached over $200,000. The Trustees therefore propose to take immediate steps toward the erection of a seperate building at Harvard University as contemplated by the founder. Prof. Putnem, the Curator, urges upon the the attention of the Trustees the advisability of publishing in occasional "Bulletins" the written matter which accumulates from time to time, without waiting for the annual report. Several papers are now on hand, and it is to be hoped that the suggestion will be adopted. This report completes the first volume, and a title-page and general index are appended, with full-page portraits of the founder, George Peabody, and its first curator, Dr. Jeffries Wyman.

FARRAR'S ILLUSTRATED GUIDE BOOK. By Chas. J. Farrar: Farrar & Johnson, 383 Washington street, Boston, publishers.

When we copy the title page of this book we have said all that can be said of it, namely: It is a guide to Rangeley, Richardson, Kaenehago, Umbagog, and Parmachene Lakes, Dixville Notch, and Andover, Maine, and vicinity, with map of the Lake Region. It also contains the game and fish laws of Maine and New Hampshire, railroad, steamboat and stage routes, time tables, list of hotels, board, and other valuable information for sportsman, tourist, or pleasure seeker. This book will be eagerly sought for by visitors to the Maine Woods. It is abundantly illustroted, and its perusal will prove of great advantage to those who read it with the intention of visiting the Rangeley Lake Region. The fact that such guides as this are becoming necessary, and are of frequent publication, show how much the interest to forest pleasures has increased since—well, since Murray's Adirondack Guide was published. Many hundreds of questions which have been asked through our correspondent's column during the last three years are answered in this book.

MAGAZINES.

Scribner's for July is patriotic in sentiment, and contains several articles *apropos* of the nation's birthday. The opening article entitled "The Signing of the Declaration," gives the history of that wonderful document. Miss Audobon contributes a paper of reminiscences of her grandfather, and Mr. Bret Harte's story of "Gabriel Conroy" is continued. It is hardly necessary to enumerate the whole table of contents of *Scribner's*. Every article is good, and the illustrations up to the high standard of this journal.

The same may be said of Messrs. Scribner's other publication, *St. Nicholas*. A perfect feast for the little ones is contained within its pages. Mr. Aldrich's comical translation of "The Oat and the Countess" is continued, and also Mr. Noah Brooks' story "Across the Plains." "Jack" discourses from his pulpit as learnedly as ever, and what with pretty stories and capital pictures, the child who would not be satisfied with *St. Nicholas* would be hard indeed to please.

Lippincott's for July also opens with articles appropriate to the anniversary, the first being a continuation of the papers on "The Century, its Fruits and its Festival," in which the main points of the great Exhibition are described, and many interesting objects illustrated. The serial entitled "The Atonement of Leam Dundas," by Mrs. E. Lynn Linton, is continued, and also Mr. Keersley's story of old Philadelphia "Thca and Yon." Tha other articles are Mr. Sidney Lanier's "Psalm of the West, rhapsodical and long; "On the Eastern Shore;" "The Angels of the Dew," by Mary B. Dodge; "Letters from South Africa" etc., etc.

The Eclectic for July contains two excellent illustrations on steel, one a copy of the old familiar "Battle of Bunker Hill," and the other a fancy sketch entitled "Fur from Home." The literary contents are also seasonable and varied, comprising articles on "Lord Macaulay," by Leslie Stephen; "Some Festivities to Natal," by Lady Barker; "Bonivard;" "The Prisoner of Chillon;" "Powers of the Air;" "A Rhyme of Ono," by Frederick Locker; "Ordeals and Oaths, by E. B. Tylor; "Spelling;" "Mrs. Thrale; the Friend of Dr. Johnson;" "Society;" "Verses in Old French Forms, by Austin Dobson;" "Gipsies and their Friends;" "Studies of Matter and Life," by Henry J. Slack, F.G.S.; "Great Guns and Armor Plating;" "Sainte Perine, the City of the Gentile;" and "Glamour." There are also additional chapters of the stirring story, "Her Dearest Foe," by Mrs. Alexander, and the editorial notes on home and foreign literature, and on science and art, are fresh and comprehensive. The publishor of the *Eclectic* is Mr. E. R. Pelton, No. 25 Bond street, New York, and as the present number commences a new volume now is the time to subscribe.

—In some of the northern districts of Victoria troops of wild horses, the produce of some escaped animals, have multiplied to such an extent as to become a serious nuisance, and all attempts to capture them have been in vain. At the approach of a mounted horseman they are off like the wind, and nothing but a South American corral, and the Quacko, with his lasso, would suffice to bring them into captivity. The habits of these wild droves are precisely similar to their South American relatives, a stallwart stallion being in command of each troop, and, on the first appearance of danger, actively rounding up his mares and foals, and leading them off.

A CONSCIENTIOUS DOG.—I had had this dog for several years and had never, even in his puppyhood, known him to steal. Nevertheless, on one occasion he was very hungry, and in the room where I was reading and he was sitting there was within easy reach a savory mutton chop. I was greatly surprised to see him stealthily remove this chop and take it under the sofa. However, I pretended not to observe what had occurred, and waited to see what would happen next. For fully a quarter of an hour this terrier remained under the sofa without making a sound, but doubtless enduring an agony of contending feelings. Eventually, however, conscience came off victorious, for, emerging from his place of concealment, and carrying in his mouth the stolen chop, he came across the room and laid the tempting morsel at my feet. The moment he dropped the stolen property he bolted again under the sofa, and from this retreat no coaxing could charm him for several hours afterward. Moreover, when during that time he was spoken to, or patted, he always turned away his head in a ludicrously conscience-stricken manner. Altogether I do not think it would be possible to imagine a more satisfactory exhibition of conscience by an animal than this; for it must be remembered, as already stated, that the particular animal in question was never beaten in his life.—*Quarterly Journal of Science.*

SALMON CANNING IN OREGON.—The Oregon canneries commenced operations much earlier this year than last, and new establishments have been opened. The prospects opened fair for a handsome increase on the business of last year, extensive as was the trade in that year. Already some lots have been forwarded by steamer and railroad, and other lots are in process of shipment. The large number of wheat vessels to go forward this year will afford abundant facilities for shipments to England, while there will also probably be larger exports direct from the Columbia River, one vessel having been already engaged to load a full cargo. A peculiarity of the business this year will be some consignments of whole fish, just as they come from the hands of the cleaner, cans having been successfully prepared for that purpose. When prepared for the table, these fish will present an appetizing appearance.

—Some of the newspapers are astonished at a horse's pulling the plug out of the bunghole of a barrel for the purpose of slaking his thirst. It's extraordinary. Now, if the horse had pulled the barrel out of the bunghole and slaked his thirst with the plug, or if the barrel had pulled the bunghole out of the horse and slaked its thirst with the plug, or if the barrel had pulled the bunghole out of the plug and slaked its thirst with the horse, or if the plug had pulled the horse out of the barrel and slaked its thirst with the bunghole, or if the bunghole had pulled the thirst out of the horse and slaked the plug with the barrel, or if the barrel had pulled the horse out of the bunghole and plugged its thirst with the slake, it might be worth while to make a fuss about it.

—An orange tree at Fort Harley, on the Santa Fee River, produced last year 8,300 oranges. It is over three feet in diameter, and casts a shadow measuring thirty-two and a half feet.

—Watermelons come by mail all the way from Florida to New York with only one transfer.

—The second crop of Florida oranges is now coming forward.

—A new hotel is in an advanced stage of erection at Palatka, Fla

ATTENTION RIFLEMEN!
The "FOREST & STREAM" New

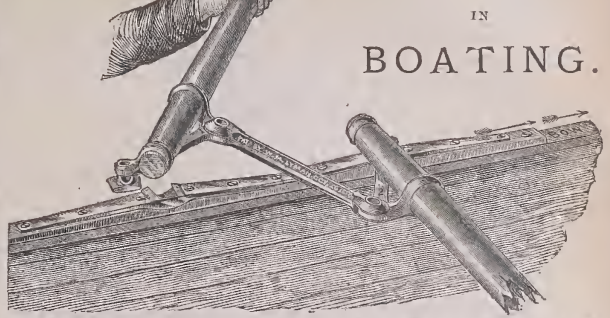
BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 30 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO., PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have need your tobaccos for many years, and know them all to be first-class.

For Sportsmen.
A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.



For Cigarettes.
A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.
Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

may26 tf

BOW-FACING ROWING GEAR.
A REVOLUTION
IN
BOATING.

This rowing gear is an invention which allows the rower to face forward instead of backward, pulling in the same manner as with the ordinary oars. The oarsman faces the direction in which he goes, and rows faster and more easily than with any other oar. The stroke is longer than with ordinary oars. The oars can be closed on out of the way without detaching them from the gunwale. The boatman makes no more effort in steering than in directing his course while walking. These oars can be attached to and detached from the boat very quickly, and they can be closed up in a convenient form for carrying. Can be attached to any boat, and is especially adapted to hunting, fishing, and all kinds of pleasure boating. Address, during Centennial, "Hunter's Camp" of Forest and Stream, Centennial Branch P. O., Philadelphia.
WM. LYMAN, Patentee.

THE "FISHING LINE."

Brook Trout and Grayling Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

The waters of the Grand Traverse Region and the Michigan North Woods are unsurpassed, if equalled, in the great abundance and variety of fish contained.

Brook Trout abound in the streams, and the famous American Grayling is found only in these waters

Brook Trout Season opens May 1st.
Grayling season opens June 1st.

Black Bass, Pike, Pickerel, and Muscalonge are also found in large numbers in the many lakes and lakelets at this territory. The sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also on and after July 1st Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, send to Forest and Stream office, or address

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Negaunee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kameska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, *via* the Illinois Central, reaches Warren, Galena and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEESE, AND BRANT SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, W. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agt., Chicago.

ORIENTAL POWDER MILLS,

MANUFACTURERS OF SUPERIOR TARGET AND SPORTING

GUNPOWDER.

BRANDS—Diamond Grain, Falcon Duckling, Western Sporting and Ducking. Also, Mining and Blasting Powders.

OFFICES—13 Broad st., Boston; 10 Exchange st., Buffalo; 9 State st., Chicago; 327 N. Second st., St. Louis Agencies in all the principal Cities in the Country. Dec3

GUNPOWDER.

Dupont's

SPORTING, SHIPPING AND MINING

POWDER.

DUPONT'S GUNPOWDER MILLS

(ESTABLISHED IN 1801),

Have maintained their great reputation for 75 years. Manufacture the Celebrated

EAGLE DUCKING, EAGLE RIFLE, AND DIAMOND GRAIN POWDER.

The most Popular Powder in Use. Also,

Sporting, Mining, Shipping and Blasting Powder

Of all kinds and descriptions.

For sale in all parts of the country. Represented by

F. L. Kneeland,

Feb 10-1y 70 Wall Street, New York.

The Hazard Powder Co.,

MANUFACTURERS OF

Gunpowder.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close, and with *great penetration.* For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½, and 6½ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.

SUPERIOR MINING AND BLASTING POWDER.

GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.

88 Wall Street, New York.

FLORIDA.

40 Acres—$50.

Out of 650,000 acres of United States and State lands ceded to the ATLANTIC, GULF & WEST INDIA TRANSIT RAILROAD, 40 acres can now be

Selected for $50.

In the centre of the orange region, adjacent to a road running daily trains from Fernandina, on the Atlantic Ocean to Cedar Keys, on the Gulf of Mexico, with the best HUNTING and FISHING in America, and almost free transportation given to each purchaser, these lands will be speedily bought up by actual settlers from all parts of the Union.

They compare favorably with THE BEST lands in the State, and are already surrounded by thrifty Northern and Western Settlers.

For maps, further descriptions, &c., address, inclosing stamp,

New York Mailing Agency.

with latest improved Newspaper Folding and Mailing Machines. 13 Spruce St., 4th door from Tribune Buildings. JAMES BRADY, Manager and Proprietor. Open day and night.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The *strongest* and *cleanest* Powder made. Nos. 1 to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,

Par water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6½ lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes. Sizes F.g. FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6½ lbs., and in canisters of 1 lb, and ½ lb.

All of the above give high velocities and less recoil than any other brands made.

BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.

SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER Co.,

26 Murray St., N. Y.

Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.

The undersigned is prepared to prove all the superior qualities he claims for his powder.

Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.

He challenges all riflemen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 200 rounds equally divided at the three ranges; sighting shots extra.

Will shoot for money if desired.

The powder is also well adapted for shot guns.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

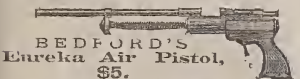
PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker on any shell now made, giving a solid seat for cone or anvil, which prevents it from drying through or bringing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2¼ to 3¼ inches.



Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,

may13-1y A. H. BOGARDUS.

TESTIMONIALS.

From Hon. J. T. Headley, the Historian, Author of "Adirondack, or Life in the Woods," &c,

It is admirably written and has just enough of humor, sentiment, and description of scenery mixed, to make it delightful. The illustrations are well chosen and very effective, while the instructions respecting routes, localities, distances, outfits, &c., embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—a compliment that I trust will be properly appreciated for its extraordinary disinterestedness.

From Albert B. Street, the Poet, and Author of "Woods and Waters," "The Indian Pass," &c.

I think it is the *best* work on the forest that has appeared—superior in word-painting to Murray's, and full of wood pictures and vivid scenes of camp-life. We realize that we are in the forest, are living with you in the scenes described, and that the trees are waving and the waters flowing over and by us. This, I think, the true test of a good book, impressing its reality and distinctive life on the mind. As a "Guide Book," it is most creditable and valuable. Indeed, it is the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for. It must have cost you intense application and labor. You may well be content that you have produced a good book.

From Benson J. Lossing, the Historian,

I have read those portions descriptive of the places which came under my personal observation, with the deepest interest, and most cheerfully testify to the general accuracy of your pictures as I recall impressions made of them at the dates of my visits. I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wonderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.

HURST'S

Stereoscopic Studies

OF

Natural History

FOR OBJECT TEACHING IN SCHOOLS

And

PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various animals and birds in grotesque attitudes, never, however, violating their natural instincts.

We offer these views, not as pictures only, but as studies from nature. One of the great moving elements in our modern system of education is object teaching. The unerring fidelity of the stereoscope transfers the animals and birds from their natural habitat to the rooms of the student and the fireside of our homes, where they cannot fail to have a lasting impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen, with its appropriate rocks, woods, or water, and coloring from the originals.

CORNELL UNIVERSITY,
ITHACA, March 14th, 1870.

I most congratulate you upon your great success in this new educational enterprise. If we can arrange our amusements so as to make them impart instruction to the mind, it will be a step in advance in education. EZRA CORNELL.

Prices: By the Dozen.....$3 00

THE NEW

BOSTON
SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and packet corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlack, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren af the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

CHAMPION GUNS OF ENGLAND.

PAPE'S

Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun. Exhibitor.
1st—Greener.....Greener.
2d—Pape..... .....Davidson.
3d—Pape.....Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun. Exhibitor.
1st—Pape.....Davidson.
2d—Pape..... .....Davidson.

1875. Long Range, 60 yards, Choke Bores.

1st—Pape.....Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape..... ....Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 2¼ dr. to 1¼ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

THE GREAT

London Gun Trial,

1875.

W. W. GREENER'S

Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: $75, gold; extra for extreme close shooting, $10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & C. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

Send 25 cents for large illustrated Catalogue of Guns, and including Game Laws for all the States, and summary of Great London Gun Trial. Ready March 1st. jan13 1y

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,

SESACHACHA*

BY MRS. EUNICE B. LAMBERTON.

I REMEMBER, I remember
As if 't were yesterday,
The ripple of a floating laugh!
Full many leagues away
They called the pond Sesachacha.
Whatever that may mean,
I only know the fairies dwelt
Above its silver sheen.

Gay vision of a tiny boat,
Or rather cockle shell,
Comes laden past the shores of time,
With whom? I may not tell,
For other boats and other hearts
Have launched and moored since then.
I only know the years go by
And never come again.

A blessing on the fairy pond,
The oars that gliuting swing,
When cliffs re-echo soft and low,
The songs we used to sing;
Sweet bonny airs, they linger yet
In memory's refrain;
Alas! to know the dream alone
Will bring them back again.

*Indian name of a pond at Nantucket, Mass.
Rochester, N. Y.*

For Forest and Stream.

Wild Sports in Japan.

BY SAMOURAI.

"Where fiery Phœbus riseth up so bright
That all the Orient laugheth with the sight."—*Chaucer.*

PROBABLY no country in the world affords a better field for amusement to the enthusiastic sportsman than old Japan, and of no country has so little been known until of late years, and since the advent of foreigners. Game from one end of the empire to the other is abundant and of varied description. The pheasants, woodcock, and snipe rival those of old England, while the several species of the duck and goose family can only be equalled in this country for delicacy of flavor and as a standard for size, etc. Aside from the feathered tribe, to those who desire larger game, deer and boar hunting is easily obtainable in season, and in the northern portion of the country still larger game exists in the shape of bears, tigers, etc. It is not many years ago that I enjoyed a week of the best sport that I experienced during a residence of several years in that country. It had been determined at the close of the busy season in Yokohama that a few of us should try our luck at game outside of treaty limits on the vast *paddy* (rice) fields north of Yedo, which extends to the province of Jo-shin, and from notes made during that excursion I propose to give you a rough outline of the trip.

On the 25th of November, 1872, B. and myself, having made all necessary preparations, started for a small hamlet called I-ta-bashi, about eighteen miles beyond Yedo. The railway from Yokohama to Yedo being still in an uncompleted state, we were obliged to use our carriage. After passing the gates of Yokohama, and a sharp pull over Nungi hill, we strike a level road, or rather dyke, and branching off to the right meet the tocaido, or government road, which extends from one end of the empire to the other. Owing to the large traffic of late on the road by carriages and carts of all descriptions between Yokohama and Yedo, it is in such a condition as to make it anything but pleasant driving, whereas formerly one could not wish for a more level highway. We pass through Kanagawa, with houses on either side barely affording sufficient passage for two carriages to pass, and it is only after a great deal of maneuvering that we manage to clear several jin-rick-shas (literally "one man power," a small cart on two wheels for one person, drawn by a coolie) without overturning them, and reach "Black Eyed Susan's" tea house, ahreast of Nan-ga-mungi, where we gladly stop for a few moments to sponge our horses' mouths out, partake of a small cup of Japanese tea, and eat a few 'tsembi. Jumping in the carriage again, we drive on, saluted by the tea house girls with "sai-yo-nara" (good bye). The road grows wider for a short distance, and makes locomotion easier for the horses, while we gradually lessen the distance and reach Kawa-saki, on the Logo River, a small village half way between Yokohama and Yedo. Unharnessing, we here take luncheon, while the bettoes (grooms) ferry the horses across the river. After an hour's chat with the tea house people, we jump aboard a flat-boat and reach the other side. The stream is only about fifty yards broad, and thus easily crossed. Here the tocaido runs in a straight line for five miles, flanked on both sides by rice fields, and is uninteresting until one arrives at Sin-a-gawa, a suburb of the city of Yedo, and formerly a notorious place for drunken yackouins and swash bucklers. However, Sin-a-gawa has wonderfully changed within the past few years. Where formerly tea houses were restricted to foreign use, their proprietors are now (1873) peaceful and obliging to travelers, and but few tipsy two-sworded men are now met with on the road. Thus we gradually enter Yedo, passing on the left the Dutch, American, and English legations, and going through the large gateway we are at last fairly in Yedo itself. A drive through the honcho dori, or main street, of a half an hour, and a sharp turn to the right, brings us to tsu-ki-ji, the foreign concession, where we have the pleasure of putting up for the night with one of the foreign diplomatic corps, who places his horse at our disposal.

After a bath and a good dinner, it required a great deal of talking to determine which was really the best place to go to shoot, B. suggesting a change in the programme. A long discussion followed, during which we had finished a liberal allowance of Burgundy and cheroots, and it was finally decided, as first agreed upon, that I-ta-bashi was the most unfrequented place, and L., our host; after making due inquiries of his boy about the necessary supplies for the week's trip, began to doze off, followed by A., with his pipe dropping into his waistcoat pocket, while B. amused himself overhauling his traps, etc. We managed to retire before twelve o'clock, and slept soundly in the comfortable beds of our host, notwithstanding the legation consisted of a Japanese house.

At six o'clock the next morning we were up and about, while A.'s waggonette and horses were already harnessed and betties (guards) on hand. The servants then stowed away our luggage while we quietly enjoyed our toast and tea. Everything being in order, we left the legation at half past six and drove off. Branching off to the left on the Na-ka-sendo, we passed through several small villages, and reached I-ta-bashi at noon. The road was in good order; in fact, as good for driving over as any country road in America, and the scenery simply lovely. The monotony of rice fields was broken here and there by fields of wheat, or a grove of magnificent old trees. The tea-house was excessively clean, and a small L which we occupied bordered on the bank of a rivulet fringed with bamboos. The remainder of the day was spent in seeing that our fire-arms were in perfect order, and preparing ammunition for the next day's sport.

At three o'clock the following morning we were aroused, and after taking our tea and toast by candlelight we sauntered out to be in readiness for the first flight of geese to their feeding grounds, which always occurs at early dawn. It was too early yet, however, and passing over the ridge of a small hill leading to the open ground, a grand sight was spread out before us. To the north the long range of mountains of Joskin were distinctly visible against the horizon, and between us for fifty miles was one vast sheet of rice fields with the narrow serpentine Nak-a-sendo traveling northward; while to the left that grand old mountain Fusi-yama (literally "Peerless Mountain") with its snow-capped dome rising from above its lesser satelites in the heavens, and the full moon shining placidly upon its mirrored surface, was a sight that few in the world are fortunate enough to witness, and one never to be forgotten. It was no time for cogitation, however, and pushing rapidly on we separated and concealed ourselves among the blinds built of rice straw that had previously been prepared for our reception.

I had hardly ensconced myself before the first faint streaks of the breaking day were visible in the eastern horizon, and with it was heard in the deep stillness of the morning the distant "honk, honk," which plainly announced the first arrival of the early birds for food. This flock passed to the left of my station, and swung around directly in front of B., who fired two barrels and brought down three geese. Becoming bewildered instead of taking their flight in a direct line, they wheeled, and circling, gave both L. and myself a fair shot, which we certainly availed ourselves of for three more paid the penalty of their temerity. For two successive hours we loaded and fired, as flock after flock arrived at their habitual feeding ground, only to be thinned and driven away. At seven o'clock a cessation of hostilities took place, and as there was no more shooting to be done with these birds for the remainder of the day, it was considered advisable to send the bag to the house and finish with snipe shooting. After dispatching a hearty breakfast we walked the fields until noon, bagging snipe at every few yards, and when the sun was high in the heavens and our noonday meal, which had been sent on before us, was reached, the three of us had 24, 26, and 35 couples of snipe to show for the morning's work; and the same ground being shot over in the afternoon afforded 52 couples of birds more. No conception can be formed of the multitude of these birds when the rice is ripe, or of the delicate flavor of their flesh. They are fine, plump, and equal in size to their English congeners.

The next day was devoted to woodcocks and pheasants, and with our trusty spaniels Becky and Diver, Hesper and Sally, we began work by skirting the woods bordering on the rice fields. Fortune favored us, and in a short time we were hard at work. Suddenly we heard "Mark woodcock!" from L., and B., having the centre, fires as a splendid bird flies silently through the tangled wood as only a woodcock can. "Well done, B.," shouted A., as his bird, twisting and twirling in among the brush wood, fell heavily. While in the very act of retrieving this bird the spaniel flushed a cock pheasant which, flying toward L., was brought suddenly to the ground by a well-directed shot. The work was now getting warm, and each man looked out for himself, with an occasional "Mark pheasant!" or "Mark woodcock!" and our hands were kept busy.

When the end of the week drew near there were few happier mortals in the world than L., B. and A., and on Saturday night when our horses' heads were turned homeward, the waggonette would not hold the game killed during the last three days. We had sent to Yedo over 250 birds of the first three days' shooting, and now we had 200 birds more to bear witness to the sport. Few can realise the pleasure that is derived from shooting in a country filled with game, and in cover where no white man ever shot before. The birds in every instance were strong on the wing, and in the perfection of condition. Those of your readers who have been fortunate enough to have visited Japan, and to have shot there, will bear me out in saying that it is without exception the finest game country in the world; and the Japanese having become of late years acquainted with this fact, have, like sensible people, framed a code of game laws which some of our sportsmen would do well to imitate for the protection of game in States where no law exist, and where extermination is only a question of time—and a very short time at that.

NOTES OF THE WHEELER EXPEDITION.

A DAY IN THE CANON.

Whipple. Not passable?
Lee. Not even jackassable.—OLD PLAY.

THE lines of this life do not always fall in pleasant places. In the chaparral, one fresh and dewy morning, a green-coated, red-throated humming-bird came while I was yet asleep and stood in the air over me like a tiny guardian angel. This was very nice, indeed, and I felt very much flattered and pleased by its graceful attentions. But last night, in the dead and solemn darkness, as I lay on the sand at the bottom of the canon, I was visited by a creature of different portent, which frightened me and displeased me exceedingly. A lizard, one of those diabolical, swift-footed little whiskabouts, flopped down on me and my dreams, at about that hour at which evil spirits are supposed to be abroad. He came from that rock on whose lee side I had chosen my berth. First he looked at me with one eye, and then fluttered across my blanketed form with an eccentric jerk and stared at me with the other. Again, with spasm after spasm of locomotion he inspected me from different points of view, until I, taking the risk of being impolite to the devil, who he probably was, cast him off and breathed freely again. No, it was not an imp of night mare, either, such as rides the school-boy after a hearty supper; this creature had the real form and substance of a lizard, though what its spirit was I do not pretend to know.

At daybreak, rolling over in search of an easier position—there is but one thing harder than a bed of sand, and that is the solid rock—I spied a scorpion just at the edge of my canvas, aspiring with clumsy claw, to climb up to me. But, foiled in his sociable intentions, it quickly became food for scientific research. Remembering the popular belief in the suicidal proclivities of this insect, reptile, or whatever it may be, we conducted it with ceremonies of martyrdom into open ground, built up around it a wall of living coals, and waited to see it sting itself and die. The prisoner became frantic with the heat, and, seeking escape, rushed toward the red embers, only to recoil from the fire. Again and again he tried, but the fence of his corral was too hot for him to climb. At last with faint and fainter squirmings he died. Did he sting himself to death? Faith, I know not. All of this time he had been wriggling through all of the motions incidental to a reptile's distress, and, in the course of these, his tail, curled in agony, did once or twice seem to touch his back. In this motion some of the spectators did see him stab himself, like a Roman at bay, but there was still a strong latent opinion among the unscientific that the wretch was simply roasted to death.

This was in the Cespe Canon, between whose immense walls and over whose rock sluices and bowlder-dams, we were seeking a thoroughfare. That was a day of hard work for animal and man. Laboring incessantly from daylight till dark, scarcely two miles of progress could we achieve. Now the task would be to flounder through some pool, where the mules must swim, soaking our provisions and luggage, and again they must leap from some ledge, which, provokingly, was not quite so high as to be impossible, nor so low as to be easy, even when filled in with a grade of loose rock. Or it would be necessary to ascend to perilous heights in order to avoid some chute of steep descent, down which the water seethed, half cataract and half rapids; or to avoid some continuous area upon which the bowlders were thickly strewn, like the cobble-stones of the street. Then, climbing and clinging, the animals of the train, weak with much fasting, would falter at some critical point, strike impotently at the ground for secure foothold, and, failing this, would sway around with the hind-quarters, fall, roll, and bound over the precipice, and to the bottom. But, plucky and tough, they never died. Though bruised and bleeding, a mule, wedged in among the ruins of his cargo after a fall of twenty, thirty, or even fifty feet, never thinks of dying. More reasonably, if his head be uppermost, he turns his jaws to the nearest leaf or clump of grass and allows his ruling passion to assert itself. Perhaps this tenacity of life is hardihood, perhaps it is stubbornness; let the mule-whacker say which.

So we worked in the Cespe Cañon, often carrying the cargo or wheeling the odometer by hand over routes where the animals could not go. Finally, defeated and sore, we retraced the steps which had been so futile, and balanced accounts with Cespe Cañon, realizing that we had lost therein much patience and piety, and also one wheel of the odometer vehicle, and had made discovery of one human skeleton, bleached, scattered, and incomplete; one miner's pick, with head all rusted and handle all shrunken and loose in its socket; and the trail of one grizzly bear, whose track was twelve and one half inches long from heel to toe nail and full six inches broad across the ball of the foot. Rather a dismal inventory, was it not, and without quite discouraging to further advance? Persons of a logical turn of mind may find connection between these three items, and infer that the man went out to seek gold and the bear went out to seek his dinner, and that, while the bear was successful, the man was not so. Or romancers may put these three lumbs together and have the basis of a novelette which shall be nuts for the juvenile intellect. Only it should be remembered that there is a slight anachronism existing between a fresh bear track and a bleached skeleton.

That was a characteristic formation of country around there, and interesting for geological study. It seems newly broken up and suggest recent igneous action. The mountains are not yet rounded down by continual washing and

wearing, but run up to a perfect right angle, which is bounded on one side by the cross-section of strata which lately were horizontal, and on the other by the ground surface, now tilted, of the same. Those were the nearest approach to the *mesas*, or isolated tables, which we saw in California. How the shell of the earth must have writhed in distortion in the days of these upheavals? At one point we stood on a sharp summit from which the layers sloped in all directions, showing that here, yielding to some mighty pressure underneath, the crust had swollen and broken in eruption, and remained piled around the mouth of this crater in great slabs, each a thousand feet thick. Looking around you, there could be seen *mesas* sloping on all sides, each with its own idiosyncrasy of angle and direction. And not only were the shapes grand, but the colors were vivid, and the transition from the black or red sandstone shore to the white was very abrupt. Such is the field that inspires the water-color artist, and in this array of antagonistic colors, and in these earths of beautiful hues, held between tinted strata, vertical, flat, and inclined, is material for a picture whose effect would be intense.

The entire physical geography of this region is remarkable, seeming as if the internal fires were yet but a short distance under ground. In a neighboring low, bald range of hills there is, according to popular belief and report, a fissure from which constantly issues a current of heated air of sulphureous smell, too hot to be tolerated with the bare hand, and there are men living not many miles away, who are willing to make affidavit that on certain nights they have seen sheets of flame break forth from here as from the chimney of a furnace. Making all due allowance for the superstition of these worthy men and their tendency to see the devil in every phenomenon of physical geography, there is still reason to believe that there is in this locality an escape of hot air or gas, which is not moist vapor, such as would arise from a hidden spring of boiling water, but is dry and stifling like the breath of a volcano. For a whole day we sought this mysterious surface vein from our earth's fiery heart, but found it not, and so it is yet undemonstrated whether this is a physical fact or a popular myth. Very probably it is half of each, a little heavy science being embellished with a little light superstition.

We traced a tepid branch of Cespe Creek to its source, and there it boiled up from the valley and down from the bluffs in a multitude of hot springs, whose temperature was 195°, and whose waters were strong with mineral substances. Everywhere the red sediment of the chalybeate spring and the whitish coating of the sulphur stream are seen in the ledges and on the marsh, while the distasteful odor of the latter meets you from afar off. On the San Emigdio Creek an epidemic, more painful than fatal, visited our camp. Its effects were peculiar, that is, peculiar usually to small boys in the season of green apples and faded watermellons. People went about the camp in devout attitudes, with bowed heads like patriarchal Davids, with hands clasped across the bosom, or thereabouts, and crying, "Oh, my soul!" or words to that effect. These were the symptoms; let the doctors decide upon the malady, and also upon its cause, which the natives attribute to the arsenic which they say infests the springs which feed the San Emigdio Creek, but for which, previous to our analysis of the waters, ont chemical savant blamed the leads of antimony which traverse the San Emigdio Mountains, and which are washed by the subterranean channel of these springs. There we saw that thing so rare in our country's mineral wealth, an antimony mine, whose sulphuret is found in masses, shining with the color and sparkle of broken lead, but more brittle and of easier fracture than that. This vein is thirty feet wide, and has been prospected and claimed for two miles of its length, but it cannot be a source of sudden gain, for its product, when purified of its rock and other refuse matter, leaving the sulphuret alone, is worth but eighty dollars a ton in San Francisco, which city is a great distance from these fastnesses.

In the Ojai Valley, just over the hills from Cespe Creek, was more novelty. It was the "tar springs," whose ebon products oozed forth and overflowed the road in a vicious coating, in which the hoofs of the traveler's horse would stick, balling with an accumulation of the stuff, which would prove a source of stumbling to the beast and of vexation to the smith when he should come to shoe him. In reality these "tar springs" were an outburst of asphaltum which welled forth on either side of the valley for miles, and, in sheets of a stygian darkness, flowed with a motion slow and invisible, like that of a glacier, and covered the road; hardened in the sun, became dusty from usage, and was as excellent an asphalt pavement as ever you saw in the city. At places it leaked forth in streams along the side of the hill; at others it bubbled up ponds of heavy liquid, which must be fenced around, in order that the settler's cattle might not be swamped in it and die. At one of these, twenty feet in diameter and of depth unknown, we stopped to observe, while our chemist was gathering a bottle of the product for analysis at home. Domestic reader, did you ever see a housewife making a kettle of mush? and did you ever notice the ebullition, slow and labored, which took place upon its surface? How a bubble would heave upward gradually until, having become a diminutive hollow cone, charged with hot air, it would break at the apex and discharge its contents with a noiseless burst and escape of steam? Just so with the cold ebullition upon the face of this black pool, only sometimes a jet of water was projected from the point of this cone, whose shell fell backward in a crater of glistening blackness, which slowly subsided to the general level. As for its temperature, the exact degree of it will always remain a mystery, for our chemical gentleman, fearing that the beauty of his thermometer would suffer defilement if it touched this pitch, inserted a finger instead, and withdrawing it as black as a Nubian's, reported the warmth "ordinary." Even in the present unsettled state of the country enterprising man has begun to utilize these tarry products, and at one of the largest springs had erected vats and other works for the purification of the crude material. But in an unfortunate conflagration these had been destroyed, and not only the buildings and the stores, which were food for a flame which illumined the country for miles around, but also the dry chaparral on the adjacent mountains for miles, and the springs themselves, which, after these many days, were still smouldering and smoking. Farther down the valley was a deserted artesian well, whose shafts had been sunk to penetrate a vein of petroleum. The machinery was still there, and the vessel of unrefined oil. These also must surrender a vial of their contents to the service of science. Once in the bottle the mixture began a voluntary process of self-purification, the water fell to the bottom, and the less ponderous petroleum, with its impurities of paraffine, naphtha, and asphaltum climbed to the top in a mass of inky blackness, overhanging the crystalline water as a thunder cloud overhangs a pure atmosphere. On being shaken, tatters and streamers fell darkly down from the upper stratum, as shreds draggle from a wind-driven cloud. It may not have been worth a second thought, but somehow I could not help considering it a very pretty sight, and a neat illustration of the law of nature which tends to adjust all bodies to their own proper level, and as such worth a place on the parlor table or in the physicist's laboratory. FRANK CARPENTER.

The Wheeler Exploring Expedition, California, 1875.

For Forest and Stream.

HUNTING NEAR ENTERPRISE, FLORIDA.

THE morning of March 1st broke clear and beautiful with the orange blossoms breathing their fragrance and the mocking-birds making the woods vocal with their song. The deep blue of the sky and the bracing air of the pine woods combined to render it a day fit for Diana herself to take the field. I had not yet killed a deer nor had a shot at one, and was desirous of showing the "Cracker's" that I could keep cool and avoid the "buck ague," which they all predicted I'd have; consequently I readily acceded to O'Steen's proposition that we should drive the "nine mile" hammock some four miles from his house. Sounding his horn for the dogs we shouldered our guns and started. We reached the "nine mile" after a brisk walk, and kept some distance along its edge without seeing anything, when all at once the yelping of old Lee as she dashed through the bushes, told us she had struck a trail, and in a few minutes the other dogs took up the cry and we knew they had jumped a deer. Away they went the sounds growing fainter and fainter in the distance, until almost inaudible, when suddenly we heard it more distinctly; the deer had turned and was coming back. We were within a hundred yards of a point in the hammock that makes out into the flat woods; on the other side of the point the dry grass was all on fire, so the deer must either turn back or come out to us. Taking in the situation at a glance O'Steen started full run for the point, while I remained where I was with my gun ready, forgetting entirely the "buck ague." Before O'Steen reached the point and while his back was still turned to me, I heard a crashing through the bushes and out dashed the deer, within twenty yards to my left. I raised the breech loader and fired, and with a tremendous somersault the noble creature fell dead; thirteen buckshot behind the shoulder. With a wild yell the old hunter rushed up to me and grasped my hand, and such a war dance as we executed then and there has not been witnessed since the days of "Billy Bowlegs." Having removed the entrails of the deer O'Steen coolly slung it on his shoulder and we started home. On the road we were joined by one of his sons who relieved him of his gun. We were within two miles of the house, when a wild turkey started out of a bunch of palmetto, and running a short distance rose in the air; when about twenty feet from the ground a load from the breech loader "went for him" and he fell to rise no more. Another hand-shaking and war dance, this being my first turkey. I estimated his weight at fifty pounds before we arrived at the house, though he proved rather thin and only weighed sixteen by the scales, but they may have been wrong. I neglected to mention that I carried him myself some distance. I had a delightful sojourn of two months in Florida, spending most of the time with the "Crackers," and think they have certainly been belied. I always had a clean bed to sleep in and plenty to eat. Venison was a drug with us, turkeys by no means scarce, and I have proved to my satisfaction that a man can eat quail every day and survive. Then the charm of wearing old clothes all the time and being able to start out into the field at a moment's notice is very great. A friend of mine had his wife with him in Florida, consequently could not rough it as I did. He pitied my lonely condition very much when we first arrived, but after killing the deer above mentioned he came out to have a day with me in the woods and enjoyed it so much that on leaving he said, "S. you are having a fine time here, I'd like to stay with you, firstrate, but like *devil of it is, I have my wife with me.*" In conclusion I would advise any of your readers who wish to have real sport, and don't mind roughing it, to go to Enterprise, and drive out from there to Aiken's, twelve miles on the road to New Smyrna. I spent three weeks there very enjoyably killing deer, turkeys and quantities of quail. A creek alive with trout (black bass) runs by the gate, and there is a beautiful lake within two miles, where Aiken has a boat. The fishing there is splendid. I found my setter invaluable, his retrieving qualities being particularly needed. In fact sportsmen make a great mistake in going anywhere without a good setter or pointer, if they expect to kill birds. Nearly all the natives have hounds. Aiken is an old Indian fighter, and at night around his blazing hearth, frequently entertained us with his hairbreadth escapes, some of which I may try to give you in a future paper. S.

AN INFALLIBLE BAIT.—No more empty baskets! Mr. Joseph Labadie, of Galveston, Texas, having made a study of fish baits for years has at length discovered an infallible bait. Like the magic ungents of the barbers, which make the hair to grow where no hair grew before, this bait will enable you to make a sure basket, whether there be fish in the stream or no. Seriously, Mr. Labadie *has* a new bait which is advertised in another column, and which appears, from accounts we have of it, to be a lure for fish of a most remarkable character. The cost is trifling, and the paste well worth a trial.

—An English writer says that in the case of fire in buildings containing horses, if the harness be merely put on, however loosely, the horses will quit the place without difficulty.

—The Pittsburg *Commercial* says: A cow in Illinois gave birth to six calves the other day—or else some body lies.

—If you intend to do a mean thing put it off till tomorrow.

—If it is better to bend than break, how is that chaps who go off on a bender so often get broke?

Fish Culture.

THE AQUARIUM.

IN the hope of supplying a want that has been expressed by readers of FOREST AND STREAM for information regarding aquaria, we give on our title page an illustration of marine life, and add some simple directions about the management of the aquarium.

Though a very simple matter, it was never understood until recently. On the introduction of gold fish, a taste was suddenly developed for keeping fish in globes, or tanks, in which the water was often changed. Though fish may be kept alive for some time in this way, they can not long remain in a healthy condition. The water should never be changed, and if we will but go to Nature for direction, we can easily learn how the water may be kept pure, and support animal life. All animals breathe oxygen, and throw off carbon, while plants breathe carbon, and throw off oxygen. If we establish in our aquarium a proper balance of animal and plant life both will thrive as in their natural homes. It is hardly necessary to give any directions about making the tanks, as they can be had of dealers everywhere in great variety. There has been introduced recently a new form of glass jar, with a capacity of from two to five gallons, that is especially adapted to the marine aquarium, as it does not magnify or distort as does the ordinary glass globe.

Supposing that our tank has been selected, we should first place in it enough clean pebbles to cover the bottom to a depth of two inches. Above these we may arrange larger rock forms, and if done with taste and judgment it will add much to the beauty of our aquarium, and also furnish hiding places for the fish. The plants should now be introduced. If our tank is to contain fresh water, most of the plants will need to be anchored down by fastening a bit of stone to their roots. The plants most useful are *Myriophyllum, Vatisneria Ceratophyllum spiralis, Antipyritica*, and *Potamogeton*. They are to be found slow-running brooks, and ponds. A tank holding twelve gallons of water should support twenty-five small fish, and we would recommend the following: Gold and silver perch, the striped dace, sun-fish, rock sun-fish, rock-fish, cat-fish, eel, lizzard, tadpole, and a small turtle may be included. An island may be formed by covering a piece of cork with moss. It is a pretty addition, and gives a chance for the lizzard and turtle to crawl out for an airing.

The salt water aquarium should be treated in much the same way. One of the best plants is *Ulva latissima*, which may be found in large fronds cast upon the beach after a strong wind has been blowing from the sea. Its color is rich dark green, and when in a healthy condition it is firm and crisp to the touch. Another very handsome plant that thrives well in the aquarium is *Catromorpha*. It is found in deep water, and can only be got by dredging. It resembles a mass of fine green threads which, when untangled, are sometimes found to be thirty feet in length. *Entromorpha compressa* is a beautiful green plant found on nearly every shore at low tide. It grows in long grass-like leaves, that move in most graceful lines with every motion of the water. We have never found it very hardy in the tank. The plants of a brown color, though very beautiful for a time, will soon decay in the aquarium. Some of the red algæ do very well and are a great addition. The *Grinnella americana* is one of the best. *Chondrus crispus*, or "Irish moss," will sometimes do well, and *Solaria*, if found growing to a bit of stone, will live in confinement, but should not be exposed in much light. There are innumerable beautiful plants to be found at low water mark, that will always tempt us to try, and if watched closely, and removed if found decaying, will do no harm.

Our illustration shows many of the most interesting animals that are adapted to the marine aquarium. In the central part of the picture is a fully-expanded anemone. Seen in this condition one can readily see why it has received the name of that beautiful flower. At times it appears a mere mass of jelly, and the fishermen along the coast have called it "halibut slime," supposing it merely a mass of slime from that fish. The body of the anemone may be described as a double gelatinous sac; the inner one is the stomach, the space between it and the outer membrane is divided by vertical partitions, each compartment being connected at the upper part with a hollow tentacle. The tentacles serve to catch, and convey to its mouth, such animals as happen within its reach. The anemone is reproduced by eggs that are thrown out in different degrees of development, sometimes, as perfectly formed anemones. They also multiply by self-division: a portion of the animal, usually near the base, gradually separates itself from the main body. If closely observed for a few days a single row of tentacles will make their appearance, and increase in number with the growth. Though a low form of life, the anemones are among the most beautiful and interesting objects in nature. In color, they vary from a light brown, to a deep chocolate. They are found on the coast north of New York, very abundantly in the vicinity of Newport. To the left of them are three of a bright red color that were brought from Barmuda. They differ from the others in having less power of expansion to the body, and have fewer tentacles, but make up for the lack of grace in form, by their gorgeous color. The general scientific name for them is *Actinia*. Just above is shown a bunch of *Serpula contortuplicata*. They belong to the *Annelida* or worms proper. They breathe through the skin by sacs or gills. In the present genus the respira-

tion is by gills which are elegant in form and brilliant in color. The body of the serpula is short, the hard tube in which it lives in the sand being many times the length of the animal. Projecting from the tube may be seen a fan-like appendage most beautifully tinted with bands of red and white. This fan is the serpula's gills, and aid it in procuring its food. If viewed with a magnifying glass, it will be seen that the exterior of the gill-tufts is covered with wonderfully delicate filaments or cilia which are constantly waving in regular ripples; by this movement a current is produced that brings in a multitude of minute animals upon which the worm feeds. The serpula is furnished with an arrangement for stopping its tube when it wishes to retire; this is a conical appendage developed from one of the little antennæ which hangs from the tube, and is called the operculum. One specimen in my tank has two kinds of plants growing from its operculum. When first placed in the tank the serpulæ are very sensitive, and pop into their tubes at the least jar. Near the serpula is shown the common shrimp, which is regarded as an excellent scavenger of the tank. The shrimps are so transparent that the food can be seen in the stomach, and we can almost trace the process of digestion.

Attached to the lower part of the rock work are more of the brown, and some of the beautiful little white, anemones. It is almost impossible to describe their form, as they are so changeable. At times hanging from the rock to which they are attached, the tentacles drooping like the petals of a withered flower, again the body stands erect, the tentacles extended to their utmost limit, and in constant motion. Suddenly a part of the body will be contracted as if a string had been drawn tightly around it, and sometimes there will be two or three of these constrictions at the same time. Again, they will assume the form of a rose, and one never tires of watching them. Some days they appear an opaque white, or cream color; an hour later we find them so nearly transparent that the interior divisions of the body can be clearly seen.

At the lower left-hand corner is shown a mussel *Modiola plicatula*), and above it the soft clam (*Mya arenaria*). The black mussel (*Mytilus edulis*), is not shown in the drawing, but is a useful member of the aquarium family, as it lives upon the little animalculæ that sometimes become so pleuty in the tank as to obstruct the view. The star-fishes are curious and interesting, but are hardly safe for the aquarium, as they are ravenous eaters, and will likely distroy the shell fish we most wish to preserve. They have a singular way of feeding. Placing themselves upon the animal they wish to devour, the digestive sac is turned inside out so as to enclose their prey, and the animal is sucked from its shell.

The hermit crab (*Pagurus longicarpus*) is shown inhabiting the shell of a *Tritia trivittata*. These curious little crabs have no armor of their own, and so take possession of any mollusk's shell that happens to fit them—usually one of the *Buccinum* family. The rock crab should not be introduced, unless it be a very small specimen, as they over-turn the rock work, and are blessed with an appetite that is never satisfied. The spider crab (*Labinica canaliculata*), is interesting and less destructive. It loves to dress itself with bits of plant, or anything that comes handy, and then parades with as much evident satisfaction as any dandy.

At the extreme right of the picture is shown a bunch of *Tubularia*. This plant-like object, is formed of a number of tubes branching in all directions; the end of the tube appears a flower, its petals closing and opening constantly. These heads live a few days, then drop from the stem to be replaced by a new head that may be seen slowly traveling up the tube. The sea-horse (*Hippocampus hudsonius*) is an other strange little animal that we should possess if possible. Its natural food is the *Serpulæ* which it sucks from the tubes, but it will feed upon the soft part of a shrimp, or clam. At the top of the illustration is shown a brauch *Sertularia*. In a picture of this kind only a faint idea can be given, as the beautiful little animals that have formed it are scarcely discernible with the naked eye.

Nearly all the animals we have named can be found on our own coast. Those who prefer to do so can purchase them of dealers. In conclusion we would say that the care of a marine aquarium can be only a source of pleasure to any one who loves nature. These animals have been drawn from my own tank—a glass jar holding about twelve quarts of water. For many months it has supported twenty or thirty anemones, besides many other animals, and has always been in a perfectly healthy condition. The only care required, was now and then a little *fresh* water to supply the evaporation. R. M. SHURTLEFF.

CONNECTICUT RIVER SALMON.

WEST MERIDEN, June 24.

EDITOR FOREST AND STREAM:—

I send you the following interesting item taken from the Hartford *Courant* and it will I think well repay those croakers at Hannum and at other places on the river to read it—and I hope they will be now manly enough to give our Fish Commissioners credit for the good work they are doing, and aid in the good cause instead of sneering at what they do not seem to understand:—

"Not so long ago that tradition does not still make the time fresh in recollection, salmon so bothered shad fishers in drawing their nets that whenever bought a shad was required to take a salmon, too, in order to clear the market. But for years and years, there has been no such thing as a Connecticut river salmon. Now, however, a real specimen of these fish has been caught at Middle Haddam by Mr. Thomas Donallon in a gill net, and is on exhibition at Stevens's market. It weighs nearly twenty pounds and is one of the most cheering things to look at in these hard times. It means that the work of the commission is not useless with regard to salmon, and it is a promise that there will be plenty of these delicious fish at our door before long. The specimen is about a yard long and a beautiful fish, though really not so silvery as some of the enormous Kenuebec ones that have been lately sold in immense quantities in this city. The fish was taken going up stream and is thought to be one of those planted in the Farmington river six years ago. If this one lived others also should be in the river."

Let me add that it seems very strange that the Fish Commission should meet with so much opposition from those places on the Connecticut river that have the benefit of all the work done by the Commissioners, and I feel certain that some of the doubting Thomas's will doubt even after the river is again filled with salmon. VOX G.

—Mr. Wilmot has, we understand, been very successful in placing salmon fry in the rivers of the eastern provinces of Canada. The numbers distributed are:—Sackville river, Halifax county, 140,000; River Philip, Cumberland, 140,000; Salmon river, Colchester, 15,000; East river, Pictou, 20,000; West river, Pictou, 10,000; Niddle river, Pictou, 10,000; Musquodohoit river, Halifax, 20,000; Nine Mile river, Shad Bay, 10,000; Little Salmon river, Preston, 10,000; Shubenacadie river, 10,000; Gold river, 10,000. There are to be 5,000 retained at the Bedford establishment near Halifax, for experimental purposes.

—On the 8th inst., S. S. Watkins again made his appearance at our Lakes with 7,500 more California salmon for these waters. Again on the 13th, the same gentleman in company with several of the business men of Hastings and Red Wing, brought with them 6,000 of the land-locked fry. —*Shakopee Argus.*

Natural History.

BIRDS OF LOWER MICHIGAN.

BY A. B. COVERT, OF ANN ARBOR.

(*Continued from Page* 318.)

FAMILY PICIDÆ.

✓ *Picus villosus.* Hairy woodpecker. A commou resident, breeding about May 1st.

✓ *Picus pubescens.* Downy woodpecker. Also common all the year. The eggs are laid about May 10th, and it sometimes rears two broods in the season.

✓ *Sphyrapicus varius.* Yellow-bellied woodpecker. Resident but not abundant. It breeds about May 1st.

✓ *Centurus carolinus.* Red-bellied woodpecker. Resident, but very rare. The eggs are laid about June 1st.

✓ *Melanerpes erythrocephalus.* Red headed woodpecker. Resident and common; breeds about April 20th.

✓ *Colaptes auratus.* Golden-winged woodpecker or flicker. This handsome bird is a very common summer inhabitant, arriving from the south by March 20th, it begins nesting by the first week in May. All are gone south by Nov. 1st.

FAMILY STRIGIDÆ.

✓ *Bubo virginianus.* Great-horned owl. A common resident. The eggs are laid from February 14th to March 20th.

✓ *Scops asio.* Screech owl. The most common of all our owls, remaining throughout the year, and nesting about May 1st.

✓ *Otus vulgaris.* Long-eared owl. Resident, but not common, breeding from the middle of April to the last of May.

✓ *Brachyotus palustris.* Short-eared owl. Resident, and very common, nesting about the last of May.

✓ *Syrnium cinereum.* Great grey owl. Resident, but not common. One set of eggs was taken March, 1871.

✓ *Syrnium nebulosum.* Barred owl. Resident and common, breeding from the last of March to the middle of April.

✓ *Nyctale acadica.* Acadian owl. Resident and tolerably common, breeding about the last of April.

FAMILY FALCONIDÆ.

✓ *Circus cyaneus.* Marsh hawk. Resident and common, breeding through May.

✓ *Accipiter fuscus.* Sharp-shinned hawk. Resident, but not common. It breeds about May 5th.

✓ *Accipiter Cooperi.* Cooper's hawk. Very common all the year, breeding from the first to the middle of May.

✓ *Falco columbarius.* Pigeon hawk. A very rare spring and fall visitor.

✓ *Falco sparverius.* Sparrow hawk. This beautiful little hawk is a tolerably common summer visitor, arriving from the south by the last of March, breeding by the 10th of May, and departing southward the last of October.

✓ *Buteo boreatis.* Red-tailed hawk. Resident and very common. The eggs are laid from the first to the middle of April.

✓ *Buteo lineatus.* Red-shouldered buzzard. A common resident. The young are batched from the middle to the last of April.

✓ *Pandion halioetus.* Fish hawk. A rare spring and fall visitor.

✓ *Haliætus leucocephalus.* Bald eagle. Very rare, but resident. One nest was taken February 14th, 1873.

FAMILY CATHARTIDÆ.

✓ *Cathartes aura.* Turkey bussard. Accidental from the south. One specimen was taken September 21st, 1874.

—A movement is on foot for the organization of a working club composed of the practical naturalists in this city and vicinity. The idea is not to make a "heavy" society of it, with a high-sounding name, but simply a means of of gathering together entomologists, ornithologists, microscospists, aquarium-students, botanists, and all others who are genuine workers in some branch of natural history, and who are willing to tell others what they know, and learn from others what they do not. It has as yet taken no definite shape, but persons likely to be interested will soon be called upon to attemnt occasional meetings.

THREE MIGRATIONS COMPARED.

We owe to the thoughtfulness of Prof. Spencer F. Baird the possession of the following information. It is a list of the dates of the arrival at Hollis, in the southern part of New Hampshire, of fifty-six species of migratory birds for three successive years. The author is W. H. Fox, and the dates are as follows:—

Name.	1874.	1875.	1876.
Turdus migratorius	March 3	April 3	March 7
Mimus carolinensis	May 6	May 10	May 6
Harporhynchus rufus	May 8	May 7	May 7
Sialia sialis	March 5	March 2	March 7
Regulus satrapa	——	April 11	April 28
Regulus calendula	——	April 14	April 15
Mniotilta varia	——	May 2	May 2
Parula americana	——	——	May 13
Helmitothpaga ruficapilla	——	——	May 9
Helmitothpaga celata	——	——	May 16
Dendroca æstiva	May 6	May 6	May 11
Dendroca virens	May 9	May 8	May 5
Dendroca cærulescens	——	——	May 12
Dendroca coronata	April 21	May 8	April 30
Dendroca blackburnia	——	May 16	May 9
Dendroca pensylvanica	——	May 10	May 14
Dendroca palmarum	April 21	April 14	April 13
Seiurus aurocapillus	——	May 10	May 9
Geothlypis trichas	——	May 10	May 9
Setophaga ruticilla	May 7	May 13	May 9
Pyranga rubra	May 21	May 21	May 13
Hirundo horreorum	May 3	May 29	May 30
Tachycineta bicolor	——	May 25	May 15
Progne purpurea	——	April 28	May 2
Ampelis cedrorum	June 3	June 3	——
Vireo olivaceus	——	——	May 8
Vireo flavifrons	——	——	May 8
Vireo solitarius	——	May 8	April 29
Carpodacus purpureus	——	April 15	April 20
Passerculus savanna	——	April 20	May 16
Poœcetes gramineus	——	April 11	April 12
Melospiza melodia	——	April 1	March 31
Spizella socialis	——	——	April 19
Spizella pusilla	——	April 24	April 19
Zonotrichia albicollis	——	——	April 23
Passerella iliaca	——	——	April 5
Goniaphea ludoviciana	——	——	May 16
Dolichonyx oryzivorus	May 10	May 10	May 5
Agelæus phœniceus	March 3	April 2	March 7
Molothrus pecoris	May 6	April 2	April 11
Sturnella neiagela	March 25	——	April 26
Quiscalus purpureus	——	March 20	April 3
Icterus Baltimore	May 10	May 10	May 6
Tyrannus carolinensis	May 11	May 10	May 3
Savornis fiscus	March 26	March 31	March 6
Empidonax minimus	——	May 10	May 1
Actro-tomus vociferus	May 15	May 11	May 6
Chordeiles virginianus	May 23	May 11	April 17
Chætura pelasgia	May 9	May 3	May 30
Ceryle alcyone	——	April 8	April 15
Colaptes auratus	April 15	March 26	April 13
Ectopistes migratorius	April 5	April 8	April 2
Tringoides macularius	April 15	May 4	April 8
Ardea herodias	——	April 17	April 13
Botaurus minor	May 13	April 17	April 13

WHAT ARE LUNGE?

BRAINERD, Minn., May 13th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of May 4th "Stanstead" has an article, in which he tells us of fishing in the "eastern townships of Canada," and speaks of fish called "silver lunge, black lunge, and racer lunge," and says, "that in most of the lakes several varieties of the lake trout or lunge were also found in large numbers." Will the writer kindly tell us what he is getting at, in writing of the lake trout and calling it a "lunge" and what species of fish the "black, silver, and racer lunge" are? That the mascanonge (see Scott in "Fishing in American Waters," page 277, and Frank Forester's "Fish and Fishing," page 151) belongs to one family of fishes, the lake trout to another, and a widely different one, will, I think, be granted by fishermen generally, and at this day and date, when the lines dividing the different families of game fishes and game birds are so rigidly drawn, it seems surprising that "Stanstead" or any one else should write of the "lunge or lake trout."

In the St. Lawrence and tributary streams, where I first "went a fishing," I have often fastened to a mascanonge, or as they are called for short all over the Canadas (the eastern townships not excepted) *longe* or lunge, and never yet in Canada, or in any other country, found "lunge" and trout of any kind plenty in the same waters. I claim to be right in this matter. I know the woods and waters of the section referred to by "Stanstead." The gentlemen whose names he gives did not call a trout a "lunge" in the days when I used to "knock around" with them. I have given my authority (needless though it may be), and I know of no better to give. HAVILAND.

The questions propounded in "Haviland's" letter respecting the identity of the "lunge" naturally occurred to ourselves, and prompted us to write to our correspondent "Stanstead" immediately upon the publication of his original article, requesting him to classify the several varieties of fish which he had named. Under his promise to do so (see letter printed herewith) we have deferred the publication of any part of the correspondence until now; but nothing additional offering, we print such data as we have. There is no doubt that the fish referred to all belong to the salmo family. "Lunge" is simply a local misnomer, like the substitution of partridge for quail or grouse), and "Haviland's" objection rests on the danger of confounding common terms, the word lunge being generally recognized as an abbreviation of the word mascalonge (*Esox nobilior*). A fixed nomenclature can alone reconcile these discrepancies and anomalies.

MONTREAL, May 9th, 1876.

EDITOR FOREST AND STREAM:—

I received your postal card on the 9th, and I also received on the same day a couple of lunge from Mr. Hubbard, of the Parks House, Magog. They were caught in the lake near his hotel. One was a fine specimen of the dark copper or black lunge, the other was a small, five-pound silver lunge. The black lunge corresponds to the minutest particular with Dr. Kay's *Salmo confinis*, and the silver lunge answers well to the description of the *Salmo nayuaush* by Richardson. It might be taken for the *Salmo adirondakis*, noble, of Morris' "American Angler's Book," but that the *salmo adirondakis*, if described accurately in Morris' book, has no teeth on the vomer, while the specimens before me has quite a number of teeth there. In regard to classifying the different species or varieties of *Salmonidæ* that are found in the eastern township waters, I know of no one that has done this, and feel very diffident about attempting it myself, though I will endeavor to get specimens from the various waters there, and with the assistance of Mr. J. Whitcaves, of the Natural History Society here, I will prepare an article for you. STANSTEAD.

A conger eel recently died in C. L. Jackson's aquarium at Southport, England, and was dissected. It held an enormous quantity of ova in two thick folds down each side of the body which together weighed seven pounds—

nearly one-third the weight of the whole fish. Carefully counting a fraction of this under the microscope, Mr. Jackson found the enormous total of 6,336,000 eggs for a conger of 15½ pounds weight.

—An English gentleman named Mann, and his wife, appear to have had remarkable success in taming a female boa constrictor, which has just died. It came to be a family pet, and was allowed the freedom of the house. It exhibited great attachment towards its owners not only, but also came to know its friends among visitors. It never exhibited any fear of children, who delighted in petting it. It was accustomed to "ask" for food, water, and to be taken to walk. It ate nothing but pigeons, consuming about one a week, and always killed them by breaking their necks before crushing them in its coils. If a pigeon were given it when it was not hungry, it would make friends with it, and afterwards ask for a new pigeon to eat. It made great friends with a kitten. The snake could entirely control the pressure of its coils, constantly twining about its owners' bodies and necks, but never hurting them. They often carried it about in traveling when it remain concealed under the coat, as though understanding the necessity of keeping quiet. When it was left behind it recognized and welcomed its friends' return with the greatest joy, answering to its name, "Cleo." The boa died during a protracted illness of Mr. Mann, apparently from grief that he could take no notice of her.

—Up to the present time naturalists have recognized but very few fishes which incubate their eggs in the mouth or in the gills. Agassiz, during his voyage up the Amazon River, discovered one species. Latterly the macropode, a Chinese fish of very singular characteristics, has been remarked to have the same peculiarity. Both belong to the great group of *labarynthobranchia* which have complicated, folded gills. There has recently been discovered in Lake Tiberias, Palestine, in the neighborhood of hot springs, a fish about seven inches long, called the *Chromis paterfamilias* which has gills disposed in simple layers, and is wholly destitute of any special apparatus for retaining either eggs or fry, and yet the male carries upwards of 200 young fish in its gills and mouth. When the female has deposited her eggs in a sandy cavity or among the weeds, he approaches and by an inspiration draws them into his mouth and forces them between the leaves of the gills. The general pressure on the eggs, afforded by the gill layers, serves to keep them in place, and there they undergo their changes. The young grow rapidly, and soon struggle to escape from their narrow prison. Eventually they find an exit through an opening into the mouth of the parent, and there they crowd together as thickly as the seeds of a pomegranite, distending the jaws of the old fish until the mouth is unable to close. Sometimes the young, although in a perfect state, remain in the gills, all, however, with their heads directed toward the mouth of their progenitor.

—Prof. Geo. W. Harper and Mr. A. G. Wetherby have compiled a list of the land and fresh water mollusks of the immediate vicinity of Cincinnati, in which they enumerate 102 species of univalves, and an equal number (curiously) of bivalves. The specific value of several of the names is, however, questioned. The same gentlemen have in course of preparation a far more extensive catalogue designed to embrace all the species found in the Ohio valley, which will be published with notes of the stations, geographical distribution, and classification. They solicit correspondence.

NOTES FROM OUR CORRESPONDENTS.—A. K. Fisher (Sing Sing, N. Y.,) has observed scarlet tanagers, olive-backed thrushes, yellow-breasted chats, and several other species of birds, feeding greedily upon the maggots in the body of a dead horse....Wm. L. Page informs us that a white crane was captured in the heart of Lynchburg, Va., on the morning of June 21st. Half of his lower mandible was entirely gone, having been broken off by flying against some object....Dr. T. D Ingersoll (Erie, Pa.,) informs us that he has just found a toeless young robin. It has the rudiments of four toes on each foot but no nails. In every other respect the bird appears to be in a normal condition. It seems to us probable that this is the result of injury, rather than deformity. An examination ought to decide this.

STRANGE NESTING PLACES.

DANVERSPORT, Mass., June 26th, 1876.

EDITOR FOREST AND STREAM:—

The enclosed items may not be without interest to those who take an interest in birds and their peculiarities. A pair of robins took up their abode in an old nest of the golden-winged woodpecker (*Colaptes auratus*) from which I obtained the woodpecker's eggs last season, by making two incisions with a saw and then splitting out the intervening piece; through the opening thus formed the robins gained access to the cavity, and there constructed their nest. When found, May 20th, 1876, it contained four eggs. In a kiln-house in the town full a dozen robins' nests have been wholly or partially built this spring upon the plate which supports the shed rafters; eight are placed near consecutive rafters, the rafters being not over three feet apart. As the house had to be used, the birds have been disturbed. Nearly every season for ten years a pair of robins have built in the same kiln, but I have never heard of so many robins building in such close proximity before. Another robin has shown very little judgement by selecting the horizontal branch of a dead walnut tree, in close proximity to an occupied boarding house, there being no other trees to shade it, the sun pelts down upon it with full force. To-day it contains young nearly fledged which appear to be doing well. Mr. Albert Fowler informs me that a pair built their nest upon the abutment of a railroad bridge near his house. The nest was under the centre of the track, and the female, though driven off by every passing train, succeeded in rearing her young.

ARTHUR F. GRAY.

—We would ask the attention of our readers to the advertisement of the old established house of Messrs. Shannon, Miller & Crane in another column. Church societies, Masonic bodies, base-ball clubs, and military organizations will find at their establishments everything suited to their requirements, and sportsmen can also be supplied with outfits of every description.

The Kennel.

A NEW KENNEL CLUB.—Dr. W. S. Webb, Mr. G. De Forest Grant, and other gentlemen have organized a new kennel club, to be known as the "Westminster Breeding Kennel," which will be devoted exclusively to the breeding of pointers. Dr. Webb's Whisky, Daisy and May are now in the kennel, and others will be added shortly. The club will not sell broken dogs, but supply young dogs of good blood from animals which have proved themselves staunch workers in the field. It is also proposed to import the finest dogs for stock purposes; pups will be sold from six weeks to two months old, simply to cover expense of breeding, and consequently at moderate prices, within the reach of all. Applications for pups may be made to Albert Philips, of West Springfield, Mass., and Dr. Webb, care of this office. Accompanying each pup will be a certified pedigree from the FOREST AND STREAM kennel stud book.

JUDGING AT BENCH SHOWS.—We continue from last week the list of points adopted in judging at bench shows in England, and which are also used in this country. They are taken from the "Fanciers' Gazette" (Eng.) If we have any fault to find with them it is the small number of points allowed for stern, which includes tail, as we consider that a fine, straight, well-feathered tail is of as much importance as adding to the beauty of a dog as his head, coat or color.

THE IRISH SETTER.

Head narrow, wideing a little in the forehead, skull slightly arched; ears a fair length, slightly folded, hanging straight, set well back in the head, and moderately feathered; eye hazel or brownish, with a sensible and loving look, not promiuent; nose dark flesh color or black; chest but moderately wide, with great depth; back straight, but slightly receding to the hip, with good loins and well-bent stifles. Stern carried slightly up, not much flagged, but slightly; coat inclined to be harsh, not soft and silky, smooth, or wavy, and thick, but not too long; color a deep mahogany red, but not any black; white, however, is allowable in some Irish breeds on chest and legs and neck.

POINTS IN JUDGING.

Head	20
Neck	5
Legs	7
Feet	5
Shoulders	15
Back	10
Loins	10
Hindquarters	15
Stern	5
Color	10—100

THE GORDON SETTER.

Head a little heavier than the English setter, more flew; deeper in chest and body, and heavier all through; more bone, and certainly more lumber to carry; therefore we cannot believe them to be such "lasters" in work. The Gordon setter is longer in the body, not so beautiful and symmetrical in shape as the English setter, but is judged by the points as near as possible to the English dog, only allowing for his being heavier. Judges principally go by quality of coat and color, being of a glossy black, with clear tan of a rich red, but of course all must be symmetrical.

POINTS IN JUDGING.

Head	20
Neck	5
Legs	5
Feet	5
Shoulders	15
Back, Loins, and Hind-quarters	20
Stern	5
Color	15
Coat	10—100

EDITOR FOREST AND STREAM:—The New York Kennel Club is rather late in claiming the name of Daisy for their lemon and white pointer pup, as I gave the name to my liver and white pointer pup out of Whisky by Mr. Schuchardt's Jim, last December.—W. S. WEBB.

—Mr. L. H. Smith's Field Trial setter bitch, Dart, visited his Leicester on the 26th June.

A WHITED CANINE SEPULCHER.—It has finally become a manifest duty to expose the true character of that hitherto generally respected beast, the Spitz dog. It is not in any spirit of auger that this unwelcome task is now undertaken. The Spitz is not precisely a popular dog, but he is nevertheless admitted to the best circles of society, and has, in too many instances, ensnared the affections of the young and thoughtless. To point out his true character is to inflict pain upon those who call themselves his friends, but the interest of the community sternly demand that this unwelcome duty should be performed.

The Spitz is generally understood to be a variety of the Pomeranian dog. That he has some connection with the latter may very possibly be true, but it is more probable that his alleged Pomeranian relationship has been assumed in order to support his claim to respectability. The best informed dog-persons assert that the Spitz is not only a native of the Arctic regions, but that his origin is by no means honorable. To speak plainly, it has been openly charged that he is the result of illicit relations on the part of the Esquimaux dog and the Arctic fox. His personal appearance is in harmony with both of these charges. He ostentatiously wears throughout our hottest months the heavy fur of an Arctic animal, and his face bears an unmistakable resemblance to the cunning and treacherous face of the fox. So far as morality is concerned, the Spitz is thoroughly and irredeemably corrupt. He is a tireless and shameless thief, and exhibits a perverted skill in obtaining access to forbidden cellars, and in stealing the reserved bones of honest and frugal dogs, which is truly vulpine. Except in rare instances, he is completely devoid of affection. If he does not bite the hand that feeds him, it is from motives of sheer selfishness. His treachery is undeniable, although his friends smooth it over by applying to it the milder term of irritability. Though he may be bound to his master by a thousand favors received, yet he will snap at him if there is the slightest failure to meet his views in respect to cold meat, or if the least liberty is taken with his tail. Indeed, no cat, however pampered, ever manifests so absurd a degree of vanity in regard to her tail as the Spitz habitually displays in regard to his own. To these objectionable qualities must be added that of cowardice. The Spitz barks from ambuscades, and bites when his victim's back is turned. At the least show of hostility he takes refuge in flight, and a child armed with a hoop-stick can safely and effectually defy his malice.

All these, however, are minor facts in comparison with the Spitz's conspicuous addiction to *rabies*. It is a startling fact that three fourths of all the cases of hydrophobia which have occurred in this city or its vicinity during the last few years have been directly or indirectly traceable to rabid Spitz dogs. The proportion may be even greater, for the statistics have not been accurately kept, and, strangely enough, no medical or dog-person has thought of inquiring whether *rabies* is more prevalent among one species of dog than among others. The increase of hydrophobia in the United States—an increase which has latterly become lamentably evident—has kept pace with the increase in the number of Spitz dogs. Twenty years ago the Spitz was rarely seen among us, and the very existence of hydrophobia was doubted. Since that time the Spitz has become so common as to be nearly valueless in the dog market, and hydrophobia has become almost as frequent as *tetanus*. This fact alone ought to have cast suspicion upon the Spitz, even if it had not been notorious that so large a proportion of the victims of hydrophobia, including the well-known Francis Butler, and the child who died in Newark the other day, were innoculated with the disease by Spitz dogs.

It is not charged that the Spitz wantonly or malignantly becomes mad, and it is quite possible that his proneness to *rabies* is the result of his attempt to live in a climate unsuited to him. That he is more delicate and liable to disease than other dogs is admitted by all who know him, and his peculiar liability to *rabies* has apparently escaped notice only by accident. That he should be for a moment tolerated by any one who is convinced that he is the chief source of hydrophobia in this latitude is, of course, out of the question. However white and spotless he may be externally, he is internally full of *rabies* and all varieties of distemper, and the moment the public is convinced of this fact the Spitz will be exterminated, and our annual panic concerning hydrophobia will have no longer any pretext or excuse.—*New York Times.*

IMPORTATION OF IRISH SETTERS.

BALTIMORE, June 27th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of April 20th I find a letter from Killaloe, County Clare, Ireland, under date of March 23d, written by one S. J. Hurley, attacking a certain exporter of Irish setters, whose name he does not give, but who I readily recognize as Mr. John M. Niall. Having imported a pair of dogs from Mr. Niall the letter in question put me on nettles, and I immediately set to work to find out the truth of Mr. Hurley's charge. Having bought my dogs through the kindness of Mr. John Dawson, the U. S. Consul at Queenstown, I immediately wrote him, and sent copies of the American sporting papers containing Hurley's letters, and have received letters from both him and Mr. Niall which entirely satisfy me that Mr. Niall has sent me exactly what he claims to have done. Indeed, so well am I satisfied that my pair having died, I intend to negotiate with him for another pair. The gist of the whole thing is this: Mr. Hurley was a clerk to the Grand Canal Co., and Mr. Niall was his bondsman. Mr. Niall finding that Hurley was not such a character as he would wish to endorse for, cancelled the bonds, hence Hurley's letters. I have the Limerick *Reporter* of May 23d, which gives an account of Mr. Niall's *trial* for thrashing Mr. Hurley on account of his (Hurley's) letters. I extract the following:—

"Mr. McNamara (Council for Niall) to Hurley. Query—Did you ever write anything in papers called FOREST AND STREAM, *Rod and Gun* and *Land and Water* against my client—any defamatory, scurrilous, scandalous letter? Witness (Hurley)—I decline to answer.

Query—Was Mr. Niall your friend? Ans.—He was.

Query—Was he not your security for a situation you held? Ans.—He was.

Query—Was he not a person who had never done you a wrong? Ans. He was.

Query—And though your friend, and securing you in your situation, you never thought it wrong to write scurrilous letters against him? Ans. I decline to answer that."

The result of the case was, that Mr. Niall was fined £6 and costs (one-third of the fine to go to Hurley), instead of being sent to Court of Quarter Sessions, as the magistrates had power to do; they evidently thinking it a justifiable assault.

These letters of Hurley's having been published by you and other American sporting papers, I think when the injustice of the charges is asserted by such evidence as Mr. Dawson, our Consul at Queenstown, it is due to Mr. Niall that his defence be published.

In regard to the dogs received from Mr. Niall, I have to say, that they were seen by a large number of the most prominent sportsmen in Baltimore, and without a dissenting voice declared one of the finest brace they had ever seen. Some of them, who had what they supposed were red Irish setters going so far as to say that these compared so closely with the description given of the class in the sporting papers that they thought they had never seen the true breed before.

CHAS. F. BANCROFT.

P. S. I have in my possession the letters and papers above mentioned, and will forward them if you desire to see them. C. F. B.

[We publish the above letter with pleasure, and had expected something of the kind at an earlier date. Indeed, as the Loudon *Field* received and published a letter identical with our own, we had looked for a notice of some kind from that quarter. The whole affair has been a mystery to us, but as Mr. Hurley's letter came to us frankly over his own signature and conveyed a direct statement that American importers of dogs were being swindled, we could do no less than publish it.—ED.]

THE CENTENNIAL BENCH SHOW.

PHILADELPHIA, June 24th, 1876.

EDITOR FOREST AND STREAM:—

The Bureau of Agriculture has decided to hold the show on Monday the 4th September instead of the 1st, and close on Friday the 8th, this is a wise course to pursue as many owners of valuable dogs would not have sent dogs to remain there for the long period of eight days. Instead of giving prizes, the Commissioners have decided to give medals together with illuminated diplomas and special reports on each animal of merit, certifying the points of merit, and negative points the dog may possess, this will be signed by the Judges and decided by the Commissioners. Thus every exhibitor of good animals will have an unimpeachable record to refer back to, and to breeders of dogs this will be of inestimable value, more so than any cup they may chance to win. Each judge in addition to recommending awards will review the development of the breed over which he is called upon to preside and refer to its present characteristics, special reference being made to animals of superlative merit. Thus will be given a grand chance to intending purchasers of obtaining authentically all the points of excellence the dogs are entitled to. The Commissioners will appoint the very best men as judges

they can possibly get; thus will be supplied a want long felt, both by breeders and purchasers of having a standered authority to refer to. Exhibitors will also possess in the medal, diploma, and report, a trophy to hand down to their sons, and by them to future generations, showing what their animals gained at the great International show of 1876.

A classified programme will be issued, showing what classes and age of dogs the medals, diplomas, and reports, will be awarded to. The handsome silver cups that have already been donated as special prizes will be an additional incentive to exhibitors.

The show bids fair to be one of the best ever yet held, and it will be of great importance to all large breeders and importers of dogs, as people from all parts of the globe will be in attendance and a better chance for the sale of dogs will never occur again. The Commission will free of charge assume the responsibility of providing food for dogs during the five days of exhibition. Entries will be free to all exhibitors. Entries close August 1st CHAS. LINCOLN, Superintendent.

The following is the new classification under which dogs are to be exhibited:—

Dogs will be divided into eight divisions, and forty-six classes.

DIVISION A.

CLASS 1.—Fox hounds—Dogs over two years; bitches over two years; dogs over one year and under two; bitches over one year and under two; puppies under twelve months.

CLASS 2.—Harrier; Class 3, beagles; Class 4, dachshunds; Class 5, otter hounds; Class 6, greyhounds; Class 7, Scotch deer hounds; Class 8, bloodhounds.

DIVISION B.

CLASS 9.—Imported English setters.—Dogs over two years; bitches over two years; dogs over one year and under two; bitches over one year and under two; dog puppies under twelve months; bitch puppies under twelve months.

CLASS 10.—Native English setters.

DIVISION C.

CLASS 11.—Imported Irish setters.

CLASS 12.—Native Irish setters.

DIVISION D.

CLASS 13.—Imported Gordon setters.

CLASS 14.—Native Gordon setters.

CLASS 15.—Russian setters.

DIVISION E.

CLASS 16.—Pointers (over 50 lbs. weight).

CLASS 17.—Pointers (under 50 lbs. wight).

CLASS 18.—Retrievers and Chesapeake Bay dogs.

DIVISION F.

CLASS 19.—Irish water spaniels.

CLASS 20.—Retrieving spaniels (other than pure Irish).

CLASS 23.—Cocker spaniels.

CLASS 24.—King Charles and Blenheim spaniels.

CLASS 25.—Springers.

CLASS 26.—Clumbers.

CLASSES 10 to 26.—Same as class 9 in respect to ages.

DIVISION G.

CLASS 27.—Mastiff dogs over two years; bitches over two years; dogs over one year and under two; bitches over one year and under two; dog or bitch puppy under 12 months.

CLASS 28.—St. Bernards; Class 29, Newfoundlands; Class 30, Siberian or Ulm dogs; Class 31, Esquimaux or coach dogs; Class 32, sheep dogs; Class 33, Bull dogs. Same as Class 27 in respect to ages.

DIVISION H.

CLASS 34.—Bull terriers—Dogs any age; bitches any age.

CLASS 35.—Fox terriers—Dogs any age; bitches any age.

CLASS 36.—Black and tan terriers (exceeding 11lbs. weight)—Dogs any age; bitches any age.

CLASS 37.—Black and tan terriers (not exceeding 11 lbs. weight)—Dogs any age; bitches any age.

CLASS 38—Sky terriers—Dogs any age; bitches any age.

CLASS 39.—Scotch terriers—Dogs any age; bitches any age.

CLASS 40.—Broken or wiry haired terriers—Dogs any age; bitches any age.

CLASS 41.—Dandie Dinmont terriers—Dogs any age; bitches any age.

CLASS 42.—Toy terriers (smooth haired) not exceeding 5 lbs.—Dogs any age; bitches any age.

CLASS 43.—Toy terriers (rough haired) not exceeding 5 lbs.—Dogs any age; bitches any age.

CLASS 44. Pomeranian or spitz—Dogs any age; bitches any age.

CLASS 45.—Poodles Dogs any age; bitches any age.

CLASS 46.—Pet dogs, including Cuban lap dogs, Leon dogs, maltese, harliess, and all other distinct breeds not classified above—Dogs and bitches any age.

A CHALLENGE.

May 11th, 1876.

EDITOR FOREST AND STREAM:—

The fact is apparent that the demand for thoroughbred setters is steadily increasing. I am glad that the enterprise which brings to our country the blue blood of England, Ireland and Scotland is heartily appreciated by all lovers of the setter. We have Laveracks, Field Trials, Gordons and Irish Reds east and west, and the mingling of this blood with our native strains will improve our stock all over the country, so that in a few years our sportsmen can secure young dogs at moderate cost, with reasonable chance that they will prove good in the field. It will hardly be claimed by any breeder, however, that the purest Laverack (or any of the other strains) dog and bitch will certainly produce noted performers; the chances are only increased. Experience teaches that noted performers are exceedingly rare. I very much question if Mr. Laverack himself ever bred twenty dogs he would pronounce fully up to his standard in every respect. If my position is correct we see it is an easy thing to raise great performers. The bench show and field trial in Europe has done much to bring the setter before the public, and as we are following in the same path like results may be expected in our country. But I ask pardon for calling the attention of American breeders to some facts that we cannot afford to overlook, if we want to surpass the original stock. I don't want to undervalue the imported dog, on the contrary, will show an Irish red at Philadelphia that is an honor to his blood, and hope to get first premium with him. I mention this to show that I have no prejudice on the subject, but am willing to accord all that is claimed for honest pedigree, and hope dogs will continue to come to this country, and I hope to live to see the day when we can send them back better than when they came. But in these days of fashionable pedigrees are we not in danger of losing sight of important points which we would do well to remember? Mr. Laverack, in his book on the setter, remarks that the dog of to-day does not compare with the setters of forty years ago; and why? Because it has become fashionable to use bearers. Shooting is made easy. A large bag is made in a few hours without the aid of dogs; but in the old times, forty years ago, the start was early, the day long, the walking rough, the covert rare, and the bag light, unless fairly earned. Such men required up-headed, gallant dogs that the day was not too long for, and it is only this kind of a dog that will suit us. In Europe shooting is more of a luxury (if we can use the word in this sense) than with us; they have none of our extremes of heat and cold to contend with, and with the exception of the prairies, our ground is rougher and our cover more severe. In addition to this, in Europe those who can enjoy the sport in perfection generally own a number of thoroughly broken dogs, and are not obliged to tire them, but when a brace shows fatigue others are at hand to take their place. There is great pleasure in a fresh dog; but after all it is a question as to whether the dog who learns to endure, and has the breeding to carry it through, is not much better than one that has not had like discipline. I admit that the dog with an honest pedigree is the best to breed from all things else being equal; but there are dogs and bitches now in high favor that are comparatively untried as performers or stock getters. One of the purest is a small, handsome bitch, but unbroken. One of her get promises well in the field, but is too slow to ever enter the lists against first class dogs. The field trial winner was next in favor. If I understand what is required at these trials, we are forced to conclude that all that is proved is good breaking; staying qualities are not tested at all. I contend that we want endurance; blood without it is worthless, and we want to show that some of our American strains have endurance highly developed—developed, too, by hard work, as well as careful crossing. What is the history of our best American strains as compared with the English breeding and training? In the first place very few American sportsmen own more than a brace of dogs; there are exceptions to this, of course, but where we find one man with two or more we find many good shots with only one dog, and it is worthy of remark the fewer they have the better they are. These dogs, if worth the having, are hunted season in and season out, hot or cold, wet or dry, good ground or bad, rough cover or good cover, they are always kept at work, and if they have talent to start with, by the time they are six years old they have become famous, and are known to all the sportsmen within reach of them. I have known dogs that have had several thousand birds killed over them by one gun. Many of these famous performers are celebrated dogs, and the result is that we find dogs with plenty of nose, fine rangers, generally up-headed, and with unsurpassed confidence, and these are the dogs we are looking to to cross with the blue bloods. I say that there is a chance that there will be mutual improvement. When our birds are winter killed, and consequently scarce, then it is the time points come out. I have seen dogs go the entire day with scarcely a point to reward them, and show no sign of fatigue, and these qualities are some that we want to breed for, and we can do it by the proper cross of native and blue blood strains.

Now, how does this compare with the way in which Gordons are bred? —that noble, blood-like dog, but unfortunately bred to color, the best pup very often consigned to the pond if not up to standard for color, and the worst one goes out for service in the field or stud. It is asking too much of such a system to produce such dogs as I have been attempting to describe. I have been thus earnest in presenting my case for fear that if any of our native stock possesses the qualities I claim for them, they may be thrown aside like Mr. Laverack's dogs of the olden time for those of newer fashion, and not gain anything by the change. I know of a native dog eleven years old, and I know he has no superior as a performer, if he has his equal, in this country. His half brother is his equal on quails, hat is not so good on grouse. The sire of these dogs was the equal of either; their grandsire was unsurpassed in his day. The dog that was broken and hunted on quails all his life has never been bred to but one good native bitch, and the get is a bitch twelve months old last March. The dog that was broken on grouse has had many good bitches, and is to-day the sire of more first-class dogs than any dog I know of.

We are all interested in this question, and I am now coming to the object in view when I started this paper, namely, to suggest some practical way of deciding the merits of the imported and native stock in the field. I would here remark that the owners of the dogs I am writing about have never sold any of them, nor do they expect to do so; therefore, this is not intended for an advertisement, but simply to direct attention to the fact that we have good dogs at home, and that we ought not to lose sight of the fact. There are three of the get of the dog I call the grouse dog about one year old, and one by a native bitch two years and a half old, and a bitch from the quail dog about one year old. I would agree to take the last-named bitch and one of the fir-t-named three to Memphis, and try them in the field trial against any descendant of any imported dog from native or imported bitch of like age—provided the dog beating me will give me a trial for one week on quails early in November. I will also try the two and a half year old dog in the field trial against any imported dog, or any descendant of any imported dog of any age on the same terms, except that win or lose in the field trial, we hunt one week, every day, rain or shine, on quails, the dog finding most birds to win, and the rules to be hunted by to be appointed by the FOREST AND STREAM. The week's shoot to come off in Indiana.

AMATEUR.

[We have the name of the person who has charge of the dogs mentioned in the above challenge, and a guarantee from a responsible person that the terms will be complied with on their part should any gentleman choose to accept it.—ED.]

KENNEL PRODUCE.—On Wednesday last, in this city, Dr. Webb's pointer bitch, Whisky, (now in the Westminster Breeding Kennel) whelped a fine litter, seven dogs and two pups. With the exception of three black ones they are all marked after the mother, black and white. Their sire is the champion dog Pete (black) of West Meriden, out of old Phil.

Gypsie, full sister to Theo. Morford's Queen, whose pedigree we published in September, 1874, produced on the 30th a litter of ten fine, strong pups, six dogs and four bitches, by Mr. Forman Taylor's famous one-eyed Sancho. Gypsie is by Mr. Morford's (Shipman's) Joe.

Yachting and Boating.

All communications from Secretaries and Friends should be mailed no later than Monday in each week.

COLUMBIA YACHT CLUB.—The ninth annual regatta of the above club was sailed on Tuesday week, from the foot of Eighty-sixth street, North River, under very satisfactory auspices. The course was to a stake boat off Yonkers and return. The following table gives a summary of the entries and the result:—

FIRST CLASS.

Name.	Start. H. M. S.	Finish. H. M. S.	Elapsed time. H. M. S.	Corrected time. H. M. S.
Emma T.	11 49 30	5 25 7	5 35 37	5 35 37
Germania	11 51 10	6 4 5	6 12 55	6 8 55

SECOND CLASS.

Lillie	11 47 0	6 25 2	6 38 2	6 38 2
Clara E.	11 52 10	6 24 37	6 32 27	6 25 27

THIRD CLASS.

Au Revoir	11 53 15	5 27 50	5 34 35	5 31 35
G. B. Dean	11 53 40	5 47 46	5 54 6	5 53 28½

FOURTH CLASS.

Tough	11 52 42	4 34 46	4 42 4	4 42 4
Queen Mab	11 53 50	5 33 37	5 39 47	5 38 54½

AGAINST THE FLEET.

Journeymac	11 51 40	5 17 43	5 26 3	5 26 3

CENTRAL HUDSON YACHT CLUB.—The regatta of the Central Hudson Yacht Club which was postponed from Thursday on account of the absence of wind, was sailed on the following day. The course was twenty miles in length and extended from the home boat off New Hamburg dock north to a buoy off Van Kensselaer's Point, thence south to Low Point Buoy and back to home buoy, a distance of ten miles and repeat, the owner of each vessel sailing his own craft. The judges were James Roosevelt, Ferdinand Schuchard and B. R. Sands. The entries in the first class were the sloop-rigged yacht W. R. Brown, of Newburg; W. R. Brown, owner; length, 27 feet 3 inches; the Le Roy, of New Hamburg; Le Roy Bros., owners; length, 27 feet 10 inches; and the Fidget, of New Hamburg; Commodore Irving Grinnell, owner; length, 27 feet 11 inches. In the second class, the Freak, of Newburg; J. H. Meddle, owner; length, 25 feet 4 inches; Mistral, of Hyde Park; J. B. Roosevelt, owner; length, 22 feet 10 inches; Thetis, of Low Point; William Ver Planck, owner; length, 21 feet 2 inches; Edith, of New Hamburg; John Van Wyck, owner; length, 23 feet 6 inches; and the Commodore, of Hyde Park (schooner-rigged); Mr. Rogers, owner; length, 24 feet 9 inches. In the third class, the Lulu, of New Hamburg, Captain Ferris, owner; length, 16 feet 6 inches; and the Shadow, of Milton, William Roe, owner; length, 16 feet. The yachts were started at 12h. 39m. the Brown being the first over, followed by the rest of the fleet all within two minutes time. The wind died away almost calm for awhile but afterwards came out from the west though only in fitful puffs. The Brown and Le Roy alternately had the lead, but the former turned the first buoy in advance. On the run home the wind was blowing fresh but died out again before the stake boat was reached. The following is a summary of the time:—

FIRST CLASS.

Name.	Start. H. M. S.	Finish. H. M. S.	Elapsed time. H. M. S.	Corrected time. H. M. S.
W. R. Brown	12 49 00	4 50 30	4 1 30	4 0 38
Le Roy	12 51 30	5 01 00	4 9 30	4 9 22½
Fidget	12 50 40	withdrawn.		

SECOND CLASS.

Mistral	12 49 50	7 33 00	6 43 45	6 39 55
Thetis	12 51 30	7 39 00	6 47 53	6 41 42
Freak	13 50 00	7 35 10	6 46 40	6 41 50
Commodore	12 43 00	withdrawn.	—	—
Edith	12 46 15	withdrawn.	—	—

THIRD CLASS.

Lulu	12 51 30	3 40 00	2 48 30	2 48 30
Shadow	12 51 30	withdrawn.		

The first prize in the first class was won by the William R. Brown, and the second prize by the Le Roy. The Mistral won the first prize in the second class and the Thetis second. The Lulu won the third class prize. The extra prize, the Corinthian challenge pennant presented by Philip Schuyler, of New York, was won by the Brown, she having made the quickest time of the race.

THE CAPE MAY RACE.—We announced in our last issue the start of the schooners America and Alarm, and sloops Arrow and Gracie, on the third and last of the "Centennial" series of regattas, the course being from Sandy Hook to Cape May Light Ship and return. The race was ended on Wednesday morning, the yachts arriving as follows:—

SCHOONERS.

Name.	Start. Monday P. M. H. M. S.	Finish Wednesday A. M. H. M. S.	Elapsed Time. H. M. S.
America	2 13 00	10 02 20	43 29 20
Alarm	2 12 30	Not timed.	

SLOOPS.

Name.	Start Monday P. M. H. M. S.	Finish Wednesday A. M. H. M. S.	Elapsed Time. H. M. S.
Arrow	1 28 45	6 04 00	40 35 15
Gracie	1 19 05	6 37 00	41 17 05

The Alarm did not pass Sandy Hook until half-past seven in the evening, anchoring inside the Horse Shoe for the night. The voyage was entirely without incident or excitement, the wind being light and baffling throughout. The Arrow was the first to pass the Cape May Light Ship, at Cape May, which she did at 3.35 P. M. on Tuesday. The prizes are a diploma, awarded by the Centennial Commissioners, and a gold medal, awarded by the Centennial Regatta Committee. These are won by the America, in the schooner class, she beating the Alarm, and by the sloop Arrow, which beats the Gracie 41m. 50s.

A NEW STEAM YACHT.—A correspondent sends us from Bridgeport the following description of a new steam yacht: I have had the pleasure of a sail twice on a new steam yacht which has just been finished here. The great merit of the craft is a newly devised propeller wheel whereby the vessel can be turned exactly upon its *own axis* without having to make a long detour to turn around. She will also side up to a dock or pier in a most remarkable manner. What a comfort such a craft would be in Florida waters, as she will turn in the *exact length* of the boat. This fact would enable her to go into the narrow bayous. She will also run directly *backwards* in a straight line if desired. She is 30ft. long, and has made 17 miles an hour before the government officials at New London. Taken altogether she is a very remarkable vessel. Should be very glad to have you come up and have a day's fishing in her.—HUNTINGTON.

THE HARVARD-YALE BOAT RACE.—The long anticipated eight-oared race, the first ever pulled in this country, was rowed at Springfield, Mass., on the 30th ult., over the four-mile course, the result being a very easy win for Yale in 22m. 2s., Harvard being ten lengths behind at the finish. Aside from the college element there was but a moderate attendance, and but little enthusiasm. It was after five o'clock before the two boats got into position and received the word to go. An even start was effected, Yale starting off with a steady stroke of 35 to the minute and Harvard with 39, and rather nervous. In the first minute Yale had gained a slight lead, and her stroke dropped to 34, Harvard coming to 36. The difference in the stroke was very marked, that of Yale being an easy, untiring swing, regular as the motion of a pendulum. Harvard's, on the contrary, was quick and nervous, wasting and tiring, and it was evident from the very start, that the race was Yale's. The steering in the Yale boat, although by no means perfect, was far better than Harvard's. Steadily the Yale boat gained, her stroke dropping to 33, from which it did not afterwards vary. Harvard, on the contrary, repeatedly spurted, going as high as forty strokes, but it was of no avail; the long, clean stroke of Yale kept them their lead without distressing the men, while in the Harvard boat the work was telling. Yale finally passed the winning line eight lengths ahead of Harvard, her time being 22m. 2s., Harvard's, 22m. 33s. After years of patient waiting Mr. Cook must feel elated anew over the victory gained by his

crew pulling the stroke for which he has contended so hard. If Harvard wins at Saratoga, the victory will mean something for Yale; should she not, Yale will be simply better than one or more of the beaten boats.

BERGEN REGATTA.—The opening regatta of the Bergen Rowing Association was held on Friday last, at South Cove, Jersey City. The first race was between a shell crew and a gig crew, the distance being a mile and a half, with the following result: –Gig Crew, First (white and blue)—Bow, H. Dickenson; 2, H. Brown; 3, J. W. Aymar; 4, F. Brown; 5, Joe Young; stroke, C. H. Bowly; W. H. Gilder, coxwain. Shell Crew, Second (white and scarlet)—Bow, H. W. Throckmorton; 2, George Phillips; 3, Frank Westervelt; 4, A. Carrick; 5, T. C. Throckmorton; stroke, Walter Smith. Time, 7:47.

A tub race came next, Harry Brown winning after an exciting contest. This was followed by a swimming match for a silver cup. The course was 200 yards, and was swum by Frank Brown in 3 minutes.

A match-race for single shells—distance, one mile and a half—brought out the following competitors:—George Phillips, W. H. Gilder. Phillips took the lead, and won easily by a quarter of a mile. Time, 7m. 45s.

The following entries were made for the single-shell race, open to all: Frank Brown, A. Carrick, R. Stratford, Harry Brown. Stratford led for the first three-quarters of a mile, when he was passed by Brown. After an exciting struggle Stratford again obtained the lead and won by half a length. Time, 8m. 21s.

ROWING ON THE PASSAIC.—The annual regatta of the Passaic Rowing Association was held on Wednesday last, three clubs, the Passaic, Eureka, and Mystic, entering crews. The first race, a mile and a half straight away, for six-oared gigs, was won by the Mystic in 8m. 24s. The single scull race over the same course brought out three entries, as follows:—G. D. Small, Triton; F. E. Townley, Triton; E. M. Roberts, Passaic. Roberts was run away from early in the race, Small and Townley being for a time side by side, Townley having a slight lead. Soon Small passed, and won the race by three or four boat lengths. Time, 9m. 6s. The third and last race was for four-oared shells, the course being three miles, from one bridge to the other and return. Three crews, one from each club, contesting. The Eureka's took the lead and passed around ahead all the way, winning by several boat lengths.

HARLEM ROWING CLUB.—The opening regatta of this club was held on Tuesday of last week, the course being between Harlem Bridge and McComb's Dam. The four-oared race resulted in a tie; time 5m. 43s. The second race, for pair-oars, was won by the Arthur crew in 9m. 17s. The third race was for six-oared barges, two contending. Mr. Knapp's crew won in 6m. All the races were one mile.

ROWING IN ENGLAND.—An international sculling race for the championship of the Thames and $1,000 a side, between Joseph Henry Sadler, champion of England, and Edward Trickett, champion of Australia, took place June 27th, on the usual racing course, from Putney to Mortlake. Trickett had the best station at the start, but Sadler held the lead for the first half mile, when Trickett got level with him, and, going to the front, reached Hammersmith Bridge four lengths ahead. From that point to Barnes ensued a most determined race, each alternately gaining the advantage, but after a hard struggle the Australian won by four lengths. The betting previous to the start was two to one, and even longer odds, in favor of Sadler.

ROWING IN ENGLAND.—A dispatch from London says that at the Henly royal regatta the Dublin University Rowing Club's four, which is to go to America to compete at the Centennial matches at Philadelphia, was beaten on the 29th ulto., over the usual Henly course, on the Thames, for the Steward's Cup. The Trinity College, Dublin, crew was beaten in the contest for the Ladies Challenge Plate. On the following day, the Visitors' Challenge Cup was won by the Oxford University Crew; Brazenose was second, and Trinity, Dublin, third.

If a collection of canvas-covered canoes could have been made for the Centennial it would have been an exhibition not only great in interest but one displaying an immense amount of inventive genius. Mr. Colvin's Adirondack Report, which contained a description of his canvas canoe, for which the frame could be cut and prepared at a moment's notice in the woods, not only gave an impetus to the manufacture of such boats, but brought out the fact that other styles of canvas canoes had been in use for greater or less periods. As a form distinct from the canoe shape we have had sporting boats without end, but of the canoe itself it may be said that canvas is superceding birch bark, and with the new modes of waterproofing, such, for instance, as the Tappan process, the first named material is so far ahead of the other that the old Indian canoe is likely soon to be a thing of the past. We have published descriptions of various styles and makes of canvas canoes, but the one mentioned in the letter below, in having a steel frame, light, yet indestructible, appears to surpass them all. In the stereoscopic view the boat is as graceful in shape, and apparently as buoyant as the most delicate craft ever turned out by Indian skill.

BOSTON, June 29th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of June 8th mention is made of a canvas canoe. Thinking you may be interested in these crafts I send you some photographs of mine, which I took last year, on the day of my return from the New York woods. The canoe shown in the stereo views was made in 1870-1, and has been used every summer and fall since; and notwithstanding its age and the many hard rubs which it has received in running rapids, is in first-rate condition. Can any one say that of a birch? In my mind there is no doubt of the credit of inventing a portable canvas canoe belonging to Mr. John H. Treat, of Lawrence, he having made one in 1866. The first canoe had a wooden frame, but in 1867 he made one with a steel frame, and finding this much better made another in 1869, improving the model, and again in 1871 made another almost like the one which I made in 1870-1, and of which you have a photograph. Comparing one of these boats with an Indion's birch canoe, after which they were modeled, they show the following points of superiority: First—a birch canoe will gain twenty pounds in weight if in use, from absorbing the water; while on the other hand Mr. Treat has often weighed his canvas canoe, after being on the water all day, and found that it had only increased eight ounces in weight. Second—from the fact of a birch taking up so much water you have a heavy boat to carry—eighty pounds, at least, for seldom can one find a birch fifteen feet long which will not weigh, when new and dry, at least sixty pounds—while these canoes only weigh 57 pounds when fifteen feet long. Third—because of the strength of the canvas and the anxiety always felt by the Indian hunters, who are limited to their bark canoes. How great this anxiety is only those can realize who have seen their guides turn their boats upside down after passing a shallow rapid, almost holding their breaths until they have seen whether their beloved crafts have escaped without much injury; for some barm always comes to these delicate but very beautiful boats whenever sharp rock scrapes against them. Fourth—they are better than a birch canoe because they are portable; not to the extent of some of the square-ended flat boats now in the market, but portable enough for many purposes, for the whole frame can be packed in a box 6ft.x7in.x4in., and sent to any port of the country where the sportsman intends going, while the cover can be folded up and put in a haversack and thrown over the shoulder. Fifth—they never leak. Let any one who dares say this of a birch. Sixth—they are neater looking; the gunwales, from being lined with steel, are only one-half inch thick, while from being made from a single piece of cloth, the outside of the boat shows no ugly pitched joints, as does a birch canoe. Seventh—they are arranged so that they can be covered in a storm, thus keeping out the rain and waves, in this way enabling the sportsman to keep his provisions and rifle dry. Eighth, and most important—they are the product of a higher grade of mental development than the Indian's boat, and for this reason ought to be preferred.

If you think it worth while I will write directions and give the measurements, so that any of your readers, if they wish, can make one; for this is the only way of obtaining them, for they are not in the market, every one who has one having made it himself.

WILLIAM. H. ROLLINS.

Sea and River Fishing.

FISH IN SEASON IN JULY.

FRESH WATER.	SALT WATER.
Trout, *Salmo fontinalis.*	Sea Bass, *Schænops ocellatus.*
Salmon, *Salmo salar.*	Sheepshead, *Archosargus probatocephalus.*
Salmon Trout, *Salmo confinis.*	
Land-locked Salmon, *Salmo Glover.*	Striped Bass, *Rocous lineatus.*
Grayling, *Thymallus tricolor.*	White Perch, *Morone americana.*
Black Bass, *Micropterus salmoides;* *M. nigricans.*	Weakfish, *Cynoscion regalis.*
	Bluefish, *Pomatomus saltatrix.*
Moskanonge, *Esox nobilior.*	Spanish Mackerel, *Cybium maculatum.*
Pike or Pickerel, *Esox lucius.*	
Yellow Perch, *Perca flavescens.*	Caro, *Cybium regale.*
	Bonito, *Sarda pelamys.*
	Kingfish, *Menticirrus nebulosus.*

For list of seasonable trout flies for July, see our issue of June 29th.

CONNECTICUT—*Windsor, June 24th.*—A fine lot of striped bass were captured in a seine at this place last week, the largest weighing 35 pounds, and the smallest 12 pounds; the number taken was 37. VON G.

MASSACHUSETTS—*New Bedford, June 30th.*—The dry weather and heat for the last week has dried up both the trout streams and fishermen. Driven to try old ocean's breezy charms, a party of seven chartered the steamer Helen Augusta, and took a trip to No Man's Land, probably the first passengers ever landed on the island by a steamer. They brought back six fine striped bass, Mr. O. A. Sisson catching two and J. Eaton, Jr., four, the largest weighing 60 pounds, the smallest 32 pounds. The markets are full of swordfish arriving daily by scores. CONCHA.

NEW YORK.—*The Adirondacks, July 1.*—Referring to big trout taken in the Upper Saranac in the same way within eight days, being lake trout of course, I find the daily memorandum on the register at Bartlett's Sportsmen's Home, during trolling season:—Dr. W. W. E., one trout 16 pounds; Mr. E. H. S., one of 6 pounds, and one of 14 pounds; Mr. C. G. A., one of 10 pounds, and one of 17 pounds; Mr. B., one 10 of pounds, and one of 19 pounds; Dr. J. R. R., six of 7, 7½, 8, 9, 10, and 17 pounds; Col. T. J. H., three of 7, 9, and 10 pounds; Mr. E. R., one of 7½. For the Centennial year on the Upper Saranac, the disciples of Sir Izaak, cannot but be blessed at their good luck. R.

MINNESOTA.—Yesterday morning Gov. Briggs, S.D. How, Trume Strait, and George Kyle, went out to Long Lake to try their luck in catching fish. They returned home shortly after dark bringing with them 275 pickerel, and bass as the result of their day's sport. There are more visitors to our lakes this season than any other previous year.—*Shakopee (Scott County) Argus.*

MISSISSIPPI—*Corinth, June 27th.*—The disciples of Isaac Walton have been rewarded with unusually large catches this season; the first being principally black bass and perch. I saw one string of 75 perch taken by one rod in six hours' fishing. GUYON.

A NOVICE CATCHES A SALMON.—The St. Lawrence (New Brunswick) *Advance* tells what trouble Commissioner Kelly had to land a big salmon at Indiantown on the Southwest Miramichi. We quote:—

On Friday afternoon there was quite an exciting time over a salmon struck by Commissioner Kelly. He was fishing with a small greenheart trout rod made by Charles Baillie of St. John, an oiled silk line of about sixty yards with single gut casting line and a very homely fly. As he walked along a log with the intention of changing his position—casting meanwhile broad off into the strong water, he struck a heavy rise and quickly discovered that he had a large fish. The little rod—one of those slight, but scientifically made pieces of workmanship for which Baillie is acquiring fame among good anglers—bent gracefully from the hand in which it was firmly, and at the same time guardedly held, the Commissioner giving his prize the butt steadily while the outer half of the rod was straight with the line. To land so apparently heavy a fish with such light tackle was hardly to be expected, but the lucky angler who had the work in hand appeared determined to accomplish it. All other rods were abandoned for the time, and Mr. K. became the centre of attraction. Every body tendered advice as to what was best to be done, while the captive sulked near the bottom for perhaps five minutes after it was struck. Then, however, the line whistled as it cut through the water, the reel revolved so fast that the click became a continuous hum and, at a distance of a hundred feet from the shore, a larger fish than was ever caught at Indiantown before shot out of the water and down into it again, giving the surface such a smack with its tail as denoted a vigor and capability to fight that promised to call out all the art of Mr. Kelly to terminate the contest successfully for him. The fish resumed a place in the deep and strong water, tugging sullenly against the stream, head off shore, and putting a great strain on the rod and running tackle, but the game was well handled and soon there was another hum of the reel, another heavy break in the water, and as the sulking was resumed, line was reeled on ready for the next dash for liberty. It was useless, however, and after a struggle of an hour and a quarter from the strike, during which the fish showed up beautifully several times, it was used up. It was then led in to a convenient place, where Mr. Orr followed it up to his knees and sometimes his waist in water. When the fish would rouse itself and endeavor to dash off again, Orr's waltzing over the line to prevent its tangling about his legs caused considerable amusement, but when he made a desperate scoop at the prize with a landing net, and, breaking it in the effort, tumbled some into the water, and the anxious spectators could scarcely tell which was Orr and which was fish, there was a joyful shout, which had hardly subsided when the wet man grabbed the salmon by the head and Mr. Crawford seized it by the tail, and it was carried in triumph to a suitable place on the bank. It was a female spring fish, in middling good condition, measuring 40 inches in length 18 inches in girth and weighing a little over 19 pounds. Mr. Kelly deserves credit for the skill he displayed throughout the whole struggle, and Baillie has reason to be proud of having made the little rod which stood the very severe test without the least sign of injury in any particular.

Answers To Correspondents.

O. K., Richmond.—In answering my question in your last issue you failed to state the price of the work mentioned. Ans. Fifty cents.

T. W., Leesburgh, Va.—As near as we can determine from you sketch the little fish is one of the minnows belonging to the genus *Hydrargira*, probably the *H. ornata.*

W. W., New York.—Where is a good place for striped bass around New York or Staten Island?—Ans. Robin's Reef. The light house at entrance to Newark Bay, and Westchester and Pelham creeks.

H. S. D., New York.—Can you inform me as to whether or not there is a shooting range or gallery in this city where the marksman can use his own rifle? Ans. At any of the galleries in practice, or if 32 calibre in matches.

D. C. S., Baltimore, Mich.—Will you please inform me through your paper what the letters O. H. S. F. and O. K. stand for before a dog's name? Ans. We have never seen an instance where these letters were placed before a dog's name. Where do you find them?

H. J. T., Boston.—Would you kindly give me some information in regard to the time and season for shooting squirrels (when they are fit to shoot and are in good condition)? Are they fit during the summer, or only in the autumn? Ans. Young squirrels mature in August and September, and the season for shooting them is in fall and winter.

K., Cambridge.—1. Which is the better month July or September, for trout fishing in Nova Scotia? 2. What is the best locality for trout fishing in the same place? 3. What is the best locality in the western half of Nova Scotia? 4. How does one get to those places from Boston? Ans. 1. July. 2. Tusket River, Yarmouth County. Reached by steamer Dominion from Boston. Sails at noon on Tuesdays.

J. S. D., Hartford, Conn.—I have a small white dog with a black spot on his side about as large as a three cent piece, which is a great eyesore to me. Can you recommend some way that I can take the hair off so that it will not come any more, as it would look much better than the black hairs, as the dog is quite shaggy? Ans. Cut the hair off close to the skin, and sear the spot with a hot iron, or burn it with lunar caustic.

R. D., Boston.—My pointer dog was troubled with mange some six months ago, the hair has grown out on the bare places excepting upon the throat, which still remains irritated. What remedy would you advise to allay the inflammation and make the hair grow? Ans. Mix a little flour of sulphur and spirits of turpentine with some bacilleon ointment, and anoint the parts affected, after washing with castile soap.

R. F. S., Philadelphia.—Is the Dittmar wood powder considered good and safe? Have heard that if you ram it, it would burst a gun. Is this so, and would you advise buying a couple of pounds for a muzzle loading rifle, and what is it worth per pound? Ans. The Dittmar powder is much used now and is considered good and safe. No powder should be hard rammed. It is sold at $1 per canister.

W. W. W., Murray, Iowa.—How will it do to shear my setter 5 (one year old) before I take him out after prairie chickens; his hair is so long I am afraid he can't stand the heat? Ans. It would not injure a setter to shear him, neither would it injure his owner to have his own head shaved, yet it would detract very much from the beauty of both. We have used setters on the prairies periodically for the past 15 years, finding them to work well without shaving off their beautiful coat, provided they were in working condition.

A SUBSCRIBER, Benicia Barracks, Cal.—1. Please inform me whether setter puppies four months old require feeding oftener than twice a day? 2. Would a litter of pups having one liver colored pass muster as thoroughbred Gordon setters at a bench show? 3. Please give pedigree of imported Shot, (late Jerome's) Gordon setter? Ans. 1. We think so. 2. We would be well to feed a pup of four months old three times a day. 3. No. 3. Mr. Jerome's, now Mr. Copeland's Shot, was imported from England by Mr. Carroll Livingston, but he did not bring his pedigree.

R. J. Mel., Philadelphia.—1. What is the route of the vessels going by the Fernandina Route? Ans. Hence, touching at Port Royal. 2. What is the cost of cabin passage? Ans. $30; excursion tickets $55. 3 What is the cost of deck (or steerage) passage? Ans. About $12. 4. What is the difference in accommodations between the cabin and deck passage? Ans. Very great. Can't explain. 5. Are the food and sleeping accommodations for the deck passengers good and clean? Ans. Yes.

H. M. L., East Minneapolis.—Will you please tell me what kinds of game are to be found in the Middle and North Parks in Colorado? Are the Indians on all hostile to any part of Texas; if so, what part and what tribes? Ans. Elk, bear, deer, mountain sheep, antelope, sage cock, trout, etc. Indians are not pleasant in Southwestern Texas. We have in our office the scalp of one who hadn't the sense to keep civil. The Indians in those parts are Comanches, at which there are several distinct bands.

A. S. B., Sodus, N. Y.—Can any of your readers give me any information in regard to the North Woods, boats, guides, expenses, etc., and also what it would cost to camp out for one month there? 2 What railroads should I take to go from Sodus there? 3. What would be the fare? Ans. We cannot answer these questions satisfactorily in a short space. Would advise you to buy Wallace's Adirondack Guide with map—Price $2 For sale at this office. It gives every item of information that can possibly be required. Guides are generally reliable and charge $2.50 per day for boat and services.

FELIX.—How do Florida oranges compare with imported fruit? Is orange culture in Florida an assured success? Ans. We have heard of large profits having been made by fruit growers in Florida, the oranges being very large and of a superior flavor. Dunn's Lake oranges have sold the last season at $18 per barrel. Other oranges sale in the New York markets as follows:—

Porto Rico, per bbl	7 00 a 9 00
Jamaica, per bbl	8 00 a 10 00
Valencia, per case	2 00 a 10 00
Pinyana, per bbl	8 00 a 9 00
Palermo, per box	3 50 a 4 00
Messina, per box	4 00 a 4 50
Sorrento, per box	3 00 a 3 50
Barrico, per bbl	7 00 a 9 00
Florida, per bbl	14 00 a 17

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, JULY 6, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Editor and Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, July 6th.—Racing: Long Branch. Trotting: Meriden, Conn.; Amenia, N. Y.; Suffolk Park, Philadelphia; Detroit, Mich; Belmont Park, Philadelphia; Point Breeze Park, Philadelphia. Regatta: Burlington, Iowa. Rifle: Sharpshooter's Union, Philadelphia. Base-Ball: Mutual vs. Louisville, at Louisville, Ky.; Boston vs. St. Louis, at St. Louis, Mo.; Hartford vs. Chicago, at Chicago, Ill.; Athletic vs. St. Louis, at St. Louis, Mo.; Olympic vs. Covington Star, at Paterson, N. J.; Alaska vs. Wilkesbarre, at Wilkesbarre, Pa.

FRIDAY, July 7th.—Trotting: Suffolk Park, Belmont Park, Point Breeze Park, Philadelphia; Detroit, Mich. Base-Ball: Alaska vs. Carbondale, at Scranton, Pa. Beverly Yacht Club Regatta.

SATURDAY, July 8th.—Racing: Long Branch. Trotting: Detroit, Mich.; Belmont Park, Philadelphia. Rifle: Creedmoor. Base-Ball: Mutual vs. Louisville, at Louisville; Boston vs. St. Louis, at St. Louis; Hartford vs. Chicago, at Chicago; Athletic vs. Cincinnati at Cincinnati; Alaska vs. Irving, at Scranton; Brooklyn vs. Cricket, at Binghampton; Nameless vs. Staten Island, at Staten Island; Produce Ex. vs. Stationer's Ex., Brooklyn; Goodwill vs. Osceola at Brooklyn.

MONDAY, July 10th.—Trotting: Ambler Park, Pa.; First race for "America" cup, N. Y. Harbor. Base Ball: Alaska vs. Cricket, at Binghampton.

TUESDAY, July 11th.—Trotting: Ambler Park, Pa.; Point Breeze Park, Pa.; Chester Park, Cincinnati. Base-Ball: Volunteer vs. Cricket, at Binghampton; Alaska vs. Ithaca, at Ithaca, N. Y.; Chatham vs. Brooklyn, at Hoboken, N. J.; Resolute vs. Chelsea, at Brooklyn; Union vs. Olympic, at Paterson; Mutual vs. Cincinnati, at Cincinnati; Boston vs. Chicago, at Chicago; Hartford vs. St. Louis, at St. Louis; Athletic vs. Lealsville, at Louisville.

WEDNESDAY, July 12th.—Trotting as above. Second race for "America" cup. Meeting of Wisconsin State Sportsman's Association, Madison, Wis.

—In summer woodcock shooting the cover is often so dense that the shooter is unable to see his dog or to know whether he is still working or on a point. In such cases a bell can be used to great advantage, and Messrs. Berrin Bros., of East Hampton, Ct., whose advertisement appears in another column, are manufacturing a small, fine-toned bell for the purpose, which costs but a small sum. The bells are finished in both nickel plate and silver, and are arranged to slide on or off the collar.

WOODCOCK IN CONNECTICUT.—The Connecticut House of Representatives has passed the Senate bill which permits the shooting of Woodcock in that State from July 1st to February 1st, excepting during the month of August.

IMPORTANT.—Care should be taken, in buying Fishing or Hunting Suits, to get a genuine Rolabird Suit, and not one of the worthless imitations which are being put on the market. The best is the cheapest.—Adv.

OUR CENTENNIAL.

THE steady march of one hundred years has brought our Republic's army of citizens to their first century's halt. It is with a joy almost fierce that the American pauses and looks back over the ground he has traversed and exults at the fulfillment of the fair promise of his youth. America has reached its majority, and the American asserts his right to admission to the councils of the world!

It is a grand occasion, and while the "powers" of the Old World may smile at the grotesque enthusiasm of our celebration, they will pardon us when they remember the trials and triumphs that have attended the Republic's youth, the severe buffetings it has had, the home discord which nearly caused its ruin.

Looking upon the material progress which our country has made within the century, those departments of science included within the scope of this journal should by no means be overlooked. That of Fish Culture is the growth of the last quarter of a century. In 1776 there was no need of it; most of the streams which our commissioners are now so anxious to re-stock with trout, salmon, shad or bass, were unknown to any other angler than the red man whose spear could never deplete their abundance.

In hunting, the old flint-lock has given place to the muzzle-loader, and that to the double-barrelled breech-loader, quick and sure. It is curious to recall how steadily these successive innovations have been resisted. Many an old fogy long looked with suspicion upon the percussion-cap; and afterwards regarded the substitution of the shell with equal disfavor.

In natural history, America has taken her place among the foremost in the age. Rafinesque, Wilson, Audubon, Townsend, Cassin, Gould, Binney, Wyman, Emmons, Hitchcock, and many others laid the foundations of the study of nature in this country within the past century, and have gone to their rest. Yet under what disadvantages the earlier ones worked. There were no scientific societies, no libraries, no museums worth speaking of, and little means of publication this side of Europe. This was not much changed until Agassiz came to this country in 1847, began the erection of the magnificent museum at Cambridge which has become the Meeca of American naturalists, and gathered about him that band of naturalists, Alex. Agassiz, Theo. Lyman, Verrill, Shaler, Packard, Morse, Hyatt, Putnam, Hagen, Allen, St. John, and the rest who are now leading research. About the same time the Smithsonian Institution was founded "for the increase and diffusion of knowledge among men," and under the guidance of Profs. Henry and Baird, has accumulated vast stores of books and materials for the elaboration of the working naturalist. Academies of Science have sprung up at Boston, New York, Philadelphia, Cincinnati, Buffalo, San Francisco, Charleston, and other cities, and it is not too much to say, that if collecting should cease completely now, there is material enough stored in these museums to keep American naturalists busy for another hundred years in close studies.
